religious subjects, but without much success. Among his pictures in public museums are "Happy as a King" (Melbourne Gallery, Australia); "The Prawn Catchers" (1831); "Sunday Morning" (1836), and "Cromer Sands" (1845), in the National Gallery, London; "Rustic Civility," "The Stray Kitten," "Hull Sands," and others in the South Kensington Museum; "The Childhood of Wilkie Collins," in the Walker Gallery, Liverpool; "Children Fishing" and "Meadford Bay," in the Fitzwilliam Museum, Cambridge; and others in Dublin, Edinburgh, Manchester, and in several provincial museums. He was the father of Wilkie Collins, the novelist. Consult: W. Wilkie Collins, *Memoirs of the Life of William Collins, Esq.* (London, 1849); Koehler, *English and American Painters* (New York, 1888).

COLLINS, William Wilkie (1824–89). An English novelist. He was the eldest son of William Collins (q.v.), a landscape and portrait painter, and he received his favorite name from Sir David Wilkie. Born in London, he was educated privately at Highbury and accompanied his father to Italy (1836–38). On his return to London he became a clerk in a London firm of tea merchants (1841–46) and afterward studied law at Lincoln's Inn, whence he was called to the bar (1851). He was already drifting towards literature. Even while in the London warehouse he turned his knowledge of Italy to good account in an historical romance entitled *Antonina; or, the Fall of Rome* (not published till 1850); on the death of his father he prepared an excellent memoir in 2 vols. (1849); and a visit to Cornwall resulted in a series of popular sketches called *Rambles beyond Railways* (1850–51). Some time in 1851 he met Dickens, and this event decided his career. Thenceforth the two novelists were intimately associated, working at times in collaboration. To *Household Words*, edited by Dickens, Collins contributed many tales, including the capital series of short stories known as *After Dark* (1856); and for *All the Year Round*, which was also conducted by Dickens, *The Woman in White* (1860), which met with instant success at home and abroad. In the meantime had appeared: *Basil: A Story of Modern Life* (1852); *Hide and Seek* (1854); *The Dead Secret* (1857); *The Queen of Hearts: A Collection of Stories* (1860). And among the numerous novels that followed are: *No Name* (1862); *Armadale* (1866); *The Moonstone* (1868); *Man and Wife* (1870); *The New Magdalen* (1873); *The Frozen Deep, and Other Stories* (1874); *The Law and the Lady* (1875); *The Two Destinies* (1876); *The Fallen Leaves* (1879); *Heart and Science* (1883); *The Legacy of Cain* (1888); *Blind Love* (1889). In 1873–74 Collins visited the United States, where he gave public readings from his own works. He died in London and was buried in Kensal Green.

Soon after his acquaintance with Dickens, Wilkie Collins began to evolve a new type of novel, in which the study of character counts for little, and in which the main effort is given to the construction of a mystery so involved in details and circumstances as to baffle the reader. Of this kind *The Woman in White* and *The Moonstone* are masterpieces. Within his sphere Collins had no equal among his contemporaries. Consult Swinburne, *Studies in Prose and Poetry* (London, 1894).

COL'LINSON, Peter (1694–1768). An English naturalist. One of his pursuits was the naturalization of plants, flowers, and trees. He sent English plants to America and brought American plants to his own country, successfully introducing many species. Benjamin Franklin was indebted to him for his first information in 1745 regarding the progress of new electrical experiments in Europe.

COLLINSON, Sir Richard (1811–83). An English naval officer. He entered the navy in 1823, in 1840 was appointed to the *Wellesley*, on which he served during the Chinese War, and in 1842 was promoted to be commander of the *Bentinck*. In 1849 he commanded the *Enterprise*, which, with the *Investigator*, Commander McClure (q.v.), was sent by way of Bering Strait for the relief of Sir John Franklin. Collinson wintered in 1850 at Hongkong, in 1851 in Prince of Wales Strait, in 1852 in Cambridge Bay, and in 1853 in Camden Bay. He arrived at Point Barrow in August of 1854. In 1858 he was awarded the gold medal of the Royal Geographical Society. He was appointed admiral on the retired list in 1875, when he became K.C.B. He edited *The Three Voyages of Martin Frobisher in Search of a Passage to Cathaia* (1867), for the Hakluyt Society.

COL'LINSVILLE. A city in Madison Co., Ill., 10 miles east by north of East St. Louis, on the Vandalia Railroad (Map: Illinois, B 5). It is an important coal-mining centre and has a lead smelter and zinc works, cowbell factory, and knitting and flour mills. The city contains a hospital and tuberculosis colony, and owns its water works. Collinsville was settled in 1800 and was first incorporated in 1830. It is governed by a charter of 1872, which provides for a mayor, elected biennially, and a unicameral council. Pop., 1900, 4021; 1910, 7478.

COL'LINWOOD. Formerly a village in Cuyahoga Co., Ohio, annexed to Cleveland in 1908. It has railroad repair shops and a street-car manufactory.

COLLI'SION. See Impact.

COLLISIONS OF VESSELS (from Lat. *collisio*, from *collidere*, to dash together, from *con-*, together + *lædere*, to dash). To prevent vessels running against one another in passing, there are "rules of the road" (q.v.) at sea as well as on land. In both the United States and Great Britain regulations are laid down which, though not having the force of law, are recognized by the admiralty courts and govern the decisions in cases of collisions. In general, they are analogous to the rules observed by pedestrians in crowded thoroughfares and by vehicles on highways. It is at night that the danger of collision is greatest; and hence the necessity for a well-arranged system of lights and other precautions. Of 3575 casualties of all kinds on and near the coasts of the United Kingdom in 1880–81, 713 were due to collisions; of these 69 resulted in total loss. The transatlantic steamers running between Queenstown, or the Channel ports, and New York have adopted the "lane system," first advocated by Lieutenant Maury, U. S. N., and afterward developed by the Hydrographic Office, United States Navy, and approved by the Marine Conference held at Washington in 1889. This consists in the assignment of a definite lane or track to each separate line of steamships, along which route their vessels are required to maintain their course.

It has been held by American courts that, if a collision happens without fault, and no blame

can be charged to those in charge of either vessel, each party must bear its own loss. In case both parties are at fault, neither can have relief at common law; but maritime courts aggregate the damage to both vessels and their cargoes and divide the amount equally between the two. In case of inscrutable fault, i.e., by a fault of those in charge of one or both vessels, and yet under such circumstances that it is impossible to learn who is at fault, the rule of equal division is also adopted. Where the fault is on the part of one vessel and no fault on the other, the owners of the vessel at fault must bear their own loss and are also liable for the damage to the other vessel. In some cases the personal liability of owners is limited to the value of the vessel and freight. Strict laws, rules, signals, etc., are adopted by all nations to prevent collisions. (See NAVIGATION LAWS.) But, no matter how exacting may be the rules, cases will occur when their following would result in disaster. No vessel should unnecessarily incur the probability of collision by strict adherence to the rules. If it is clearly in the power of one vessel to avoid collision by departing from the rules, she will be held bound to do so; but a vessel is not required to depart from the rule when she cannot do so without danger. A proper lookout must be kept; the absence of such a lookout is in itself evidence of negligence. In some cases certain lights must be kept. Loss of a vessel injured by a collision is within the ordinary policy of insurance; but when the collision is the fault of the insured vessel, or of both vessels, the insurer is not ordinarily liable for injury done to the other vessel which may be decreed against the vessel insured, although recent policies provide that the insurer shall be liable in such case.

COLLITZ, HERMANN (1855–). An American philologist. He was born in Bleckede, Hanover, and was educated at Lüneburg, Göttingen (Ph.D., 1879), and Berlin. He was assistant librarian (1883–86) and instructor in Sanskrit and comparative philology (1885–86) at the University of Halle. In 1886 he came to the United States. He was professor of German until 1897 and of comparative philology until 1907 at Bryn Mawr, and then became professor of Germanic philology at Johns Hopkins University. His earlier work was in comparative philology in general and Greek dialects in particular; his later in German philology. He published: *Sammlung der griechischen Dialektinschriften* (1884–1909; with Bechtel), including all of importance for dialect study; *Die Verwandtschaftsverhältnisse der griechischen Dialekte* (1895); *Die neueste Sprachforschung* (1886). He became an editor of *Modern Language Notes*, the *Journal of English and Germanic Philology*, and *Hesperia: Schriften zur germanischen Philologie;* and he contributed to the first edition of the NEW INTERNATIONAL ENCYCLOPÆDIA.

COLLITZ, KLARA HECHTENBURG (1863–). An American philologist, wife of Hermann Collitz. She was born at Rheyat, Rhenish Prussia, and was educated at Neuwied, Lausanne, the University of London, Oxford, and Heidelberg (Ph.D., 1901), specializing in linguistics. She lectured on French philology at Victoria College, Belfast (1895–96), on Germanic at Smith College (1897–99), and on the same subject for women students at Oxford (1901–04). She then returned to the United States. She wrote, besides contributions to periodicals, *Das Fremdwort bei Grimmelshausen* (1901), *Der Briefstil im 17. Jahrhundert* (1903), *Fremdwörterbuch des 17. Jahrhunderts* (1904), and edited *Selections from Early German Literature* (1910); *Selections from Classical German Literature* (1914).

COLLO'DION (Neo-Lat., from Gk. κολλώδης, *kollōdēs*, gluelike, from κόλλα, *kolla*, glue + εἶδος, *eidos*, form). A solution of pyroxylin in a mixture of alcohol and ether. For its manufacture a convenient form of cellulose, such as cotton wool, is immersed in a mixture of nitric and sulphuric acid with a little water, or in a mixture of potassium nitrate with sulphuric acid. The product is thoroughly washed in water and dried. The pyroxylin thus obtained is then treated with ether, to which alcohol is added until the substance is completely dissolved. The solution is a clear, colorless liquid that does not mix with water or alcohol, but readily mixes with ether; when exposed to the air, it dries up, leaving a transparent film, which becomes electric by friction and may be exploded by heat, pressure, or percussion. Mixed with substances sensitive to light, collodion is extensively used in photography; the mixture is spread over a glass plate, on which it forms, when dried, a sensitive film. Collodion is also used in surgery, the tenacious and transparent film left by its evaporation preventing the access of air to the injured surface and protecting it from infection. Pills and other medicinal preparations may be coated with it so as to render them tasteless. Among the medicinal collodions that are official is *blistering* or *vesicating collodion*, which consists of cantharides dissolved in collodion; the solution is applied to the skin when it is desired to raise a blister. Wood, paper, and fabrics may be rendered waterproof by being covered with collodion. Small balloons are made from it by pouring a solution into a flask of the desired dimensions, which is then turned about so as to spread the liquid uniformly over the surface and then inverted to allow the excess to run out. The solvent is then allowed to evaporate, and the edges of the remaining film are loosened from the glass by attaching a glass tube to the neck of the flask and withdrawing the air, whereupon the collodion balloon detaches itself, contracts, and is easily withdrawn. See also CELLULOSE and the references given under that head.

COL'LOIDS (from Gk. κόλλα, *kolla*, glue + εἶδος, *eidos*, form). A name applied by Graham to a group of substances, including ferric oxide, alumina, silicic acid, starch, dextrin, gum, albumin, gelatin, tannin, caramel, agar-agar, and others. These substances, though not by any means belonging to the same class chemically, behave alike in certain respects when obtained in solution in water or in some other solvent. In the first place, they diffuse, when dissolved, very much more slowly than most other substances ordinarily met with. In the second place, their presence in solution has scarcely any effect on the freezing point or on the vapor tension of the solvent, while most other substances have the effect of notably lowering both the freezing point and the vapor tension. Again, colloids often spontaneously deposit from their solutions in the form of gelatinous masses that cannot in many cases be redissolved and that usually retain mechanically a large amount of water. Such "gelatinized solutions" are now

used for a variety of purposes in the arts, advantage being taken of the mass being in a semi-solid condition, while the liquid retained by it may be used for the same purposes as when in the free state; such masses are used in photography by the "dry" process, in making "dry" electric batteries, in the manufacture of certain valuable explosives, etc. In scientific researches gelatinized solutions are now used for the purpose of studying the relative rates at which various substances diffuse in water. For this purpose it is important that the solutions should remain absolutely undisturbed for a considerable length of time, and this is accomplished best by adding to them a certain amount of agar-agar or some other colloid, and causing them to "gelatinize," the "dry" solutions thus obtained showing the same rates of diffusion as ordinary aqueous solutions. (See DIFFUSION.)

Another important property of colloids is their incapacity of traversing parchment paper and animal membranes. This permits of the separation of colloids from noncolloids (called "crystalloids") without any difficulty; the process of separation being known as *dialysis*. Thus, to dialyze a solution containing common salt (a crystalloid) and silicic acid (a colloid), the solution may be placed in a bag of parchment paper and immersed in pure water: the salt will then readily pass through the paper, while the silicic acid will remain behind.

The properties of colloids are undoubtedly due to the comparatively very large size of their molecules. Thus, while the molecular weight of water is only 18, and that of most organic substances only a few hundred, the molecular weight of dissolved starch has been shown to be about 25,000, and that of dissolved silicic acid is at least 50,000.

The particles of a colloidal substance in solution must thus be considered as made up, not of single chemical molecules, but of aggregates of them. And in many cases the aggregates, or "colloidal molecules," are large enough to be "seen" by the method of so-called *ultra*-microscopy. When, viz., a colloidal solution is examined microscopically by transmitted light, as usual, it appears as clear and homogeneous as water or, say, a solution of common salt. If, however, a powerful beam of light is directed into the colloidal solution sidewise, perpendicularly to the axis of the microscope, then the path of the ray becomes visible by reflection of the light from the colloidal particles, just as the path of a ray entering a darkened room through a small hole in a shutter is rendered visible by the dust particles in the air. In this manner Zsigmondy, in 1906, was able to discern colloidal molecules whose diameter was only *a few millionths of a millimeter*, or even only one-millionth. No wonder chemists are beginning to hope that the true chemical molecules themselves may yet actually be seen.

An interesting colloidal solution in the *solid* state of aggregation is constituted by ordinary ruby glass. When examined ultramicroscopically, ruby glass appears like a suspension of gold dust in a colorless transparent medium; yet by transmitted light the microscope shows it as no less homogeneous than ordinary colorless glass. Bredig in 1901, Svedberg in 1906, and others since, have also succeeded in obtaining colloidal solutions of metals in liquids, e.g., of gold, silver, and platinum in water, and of cadmium and even the alkali metals in organic solvents. Bredig's method consisted in establishing an electric arc between electrodes of the metal whose solution was desired, under the surface of the solvent, the direct current being used. Svedberg used the alternating current and kept the solvent during the operation at a low temperature. All the metal solutions so obtained looked perfectly homogeneous under the microscope, though more or less strongly colored; the ultramicroscope, however, showed plainly the colloidal molecules distributed throughout their volume like fine dust. Zsigmondy has shown that the colloidal molecules of all such solutions, whether the dissolved colloid be a metal or not, are constantly vibrating ("Brownian movement," so called after the English botanist Brown, who as far back as 1827 observed the continual vibration of fine particles of solids suspended in liquids), and in the case of the finest visible molecules he has also observed a secondary, translatory motion. It has since been demonstrated, by Perrin and others, that these movements are in complete accord with the kinetic theory of gases and that the colloidal molecules obey the gas laws in every respect, so that the movements themselves are nothing else than the molecular motion which has long been assumed to constitute heat. Thus the study of colloidal solutions has in recent years turned the kinetic hypothesis of heat into practically a fact.

We have seen that the colloidal molecule is really a complex made up of a large number of the minuter chemical molecules. It seems probable that some of these component particles of the colloidal molecule are electrically charged ions (see DISSOCIATION, *Electrolytic*), and that unless ions formed part of their composition they could not exist in solution at all, but would form coarser conglomerates and "precipitate out," or, in the case of very fine suspensions, "settle out." That colloids in solution carry electric charges, is indicated by the fact that when the terminals of an electric battery are introduced into a colloidal solution, the colloid migrates in the direction of one of the terminals: ferric hydrate, e.g., moves in the direction of the current; colloidal platinum, silicic acid, and other substances, move *against* the current. In suspensions such movements caused by the electric current were first observed by Quincke in 1861—a phenomenon referred to as *cataphoresis*. That, unless charged, colloids cannot remain dissolved, is indicated by Picton and Linder's rule, according to which colloids which migrate, under the influence of the current, in opposite directions, cause each other's precipitation if their solutions are mixed: plainly, colloids which migrate in opposite directions must be charged with the opposite electricities; when mixed, they neutralize each other's charge, and since precipitation is the result, the inference is justified that the electric charge is indispensable to the existence of either colloid in the dissolved state. If this view is correct, then we are justified in expecting that a certain definite quantity of one colloid will be necessary and sufficient completely to precipitate another; for electric neutralization can only set in when the opposite charges brought together are equal. That this is really the case, was shown by Biltz in 1904. Colloidal gold travels *against* the current; colloidal zirconium hydroxide travels *with* the current. When to a gold solution containing

1.4 milligrams of the metal Biltz added gradually increasing amounts of the zirconium hydroxide, he found that complete precipitation occurred only when 1.6 milligrams of the latter had been added; when the amount added was only 0.065 milligram, no precipitation could be observed. On the other hand, when to a similar amount of colloidal gold as before he added at once as much as 16.2 milligrams of the precipitating colloid, the mixed solution remained clear, the charge carried by the zirconium hydroxide being in this case sufficient, not only to neutralize the opposite charge of the gold, but also to maintain in solution the resulting colloidal mixture.

Bibliography. The literature on colloidal solutions—or "disperse systems," as they are now frequently called—is yearly growing more and more extensive. A summary may be found in Freundlich, *Kapillarchemie* (Leipzig, 1909). Consult also: Lottermoser, *Anorganische Kolloide* (Stuttgart, 1901); Bredig, *Anorganische Fermente* (Leipzig, 1901); Müller, *Theorie der Kolloide* (ib., 1903); Zsigmondy, *Zur Erkenntnis der Kolloide* (Jena, 1905); Perrin, *Les atomes* (Paris, 1913).

COLLOPH'ANITE (from Gk. *κόλλα, kolla*, glue + *φαίνειν, phainein*, to show). Amorphous hydrated calcium phosphate. It has a banded structure, resembling opal, and a conchoidal fracture. In color it is snow-white or yellowish white. This mineral is found chiefly on the island of Sombrero, having been formed in the elevated coral reef by infiltration of salts from the overlying guano.

COL'LOP MONDAY. An old English phrase used to designate the Monday before Lent, from the custom of those days (when fasting was more strictly observed than at present) of cutting meat into strips or collops and salting it to keep till after Lent.

COLLOT D' HERBOIS, kô'lô' dâr'bwä', Jean Marie (1750–96). A French Revolutionist. He was born in Paris and passed his early life as an actor. After visiting Holland and acting as the director of a troupe at Geneva, D'Herbois took to playwriting. Most of his productions were adaptations from English and Spanish, and one, *Le paysan magistrat* (1777), was popular for a time. In 1789 D'Herbois, who was then living in Paris, wrote *La famille patriot ou la fédération*, a Revolutionary drama, and followed up this success by bringing out the *Almanach du Père Gérard*, for which he was awarded a prize by the Jacobin Club. Elected as the third deputy from Paris to the Convention in 1792, he became in the following year president of that body and a member of the Committee of Public Safety. In November, 1793, he was sent to Lyons to complete the work of pacification begun by Couthon. There he showed himself merciless in the service of the Republic and caused 1600 persons to be put to death. On returning to Paris he found himself, owing to his popularity, an object of suspicion to Robespierre, and, after an attempt to assassinate him had failed, Robespierre's jealousy increased. Collot d'Herbois took part in the conspiracy which led to Robespierre's downfall, but the reaction was fatal to himself. He was expelled from the National Convention, and in April, 1795, was sentenced to deportation to Cayenne, where he died of fever, Jan. 8, 1796. Consult: Aulard, *Les orateurs de la Législative et de la Convention* (Paris, 1885–86); Morse-Stephens, *The French Revolution* (London, 1891) and *Statesmen and Orators of the French Revolution* (Oxford, 1892).

COLLU'SION (Lat. *collusio*, from *colludere;* to defraud, to play together, from *con-*, together + *ludere*, to play). In law, a species of fraud (q.v.), consisting in an agreement between two or more persons to defraud a third, or to accomplish some illegal purpose; thus, it is collusion for a failing debtor to transfer property to another, who receives it to enable him to defraud some or all of his creditors; or for husband and wife, by mutual agreement or understanding, to institute a suit to procure a divorce without legal cause. Such transactions or proceedings are voidable because of their fraudulent character.

COLLU'THUS, or Coluthus (Lat., from Gk. Κόλλουθος, *Kollouthos*). A Greek poet of the fifth century, a native of Lycopolis in Upper Egypt. He wrote various works, on the hunt of the Calydonian Boar (q.v.), the Persian wars, etc. Only one is extant, a poem in 392 hexameters, entitled Ἑλένης Ἁρπαλή, *Helenēs Harpalē*, or the *Rape of Helen*, which was discovered by Cardinal Bessarion in Calabria. The versification is good, but the poem is, on the whole, a poor imitation of Homer, without imagination. The text has been edited by Lehrs in the Didot collection (1841), and by Abel (1880).

COLL'YER, Robert (1823–1912). An American clergyman of the Unitarian church. He was born at Keighley, Yorkshire, England; at eight years of age he was a mill hand; at 14, a blacksmith; and in 1849 he became a local preacher of the Methodist church. In 1850 he came to America and began work as a hammer maker at Shoemakersville, Pa. His license as a Methodist minister was revoked, partly for his preaching against slavery. In 1859 he joined the Unitarian church and went to Chicago as a missionary of that denomination and shortly after organized and became pastor of Unity Church. He was prominent during the Civil War in the work of the Sanitary Commission. He was called in 1879 to the Church of the Messiah, New York City, of which, after a successful active pastorate, he was senior associate minister from 1903 until his death. His publications include: two volumes of sermons, *Nature and Life* (1865; 11th ed., 1882) and *The Life that Now Is* (1871; 10th ed., 1882), written in a style noteworthy for its effective Anglo-Saxon vocabulary; *The Single Truth* (1877); *History of Ilkley* (1883; with Horsefall Turner); *Things New and Old* (1893); and *Clear Grit* (1914), a collection of lectures, addresses, and poems, edited by J. Haynes Holmes.

COLM, Saint. See Columba, Saint.

COLMAN, kōl'man, Benjamin (1673–1747). An American Congregational clergyman, prominent in the Colonial period. He was born in Boston, graduated at Harvard in 1692, preached and studied theology for three years, and spent the years 1695–99 in England. After his return he became first pastor of the newly organized Brattle Street Church, a position which he filled until his death. He was opposed by Increase and Cotton Mather (qq.v.), who insisted that his ordination, in England and by Presbyterians, was irregular. He exercised a great influence both in religious and secular affairs and was a popular preacher. In 1724 he re-

fused the presidency of Harvard College. He aided in the foundation of Yale. Besides a collection of sermons, in 3 vols. (1707–22), he published a number of poems and a pamphlet advocating inoculation for the smallpox. Consult Turell (Colman's son-in-law), *Life and Character of Benjamin Colman* (Boston, 1749).

COLMAN, George, called The Elder (1732–94). An English dramatic author and theatrical manager. He was born in Florence, was educated at Oxford, and was called to the bar in 1755, but soon abandoned law for literature. In 1760 his first dramatic piece, entitled *Polly Honeycomb*, was produced at Drury Lane with great success. This comedy was followed the next year with *The Jealous Wife*, and in 1766 with *The Clandestine Marriage*, written in conjunction with Garrick. In 1767 he became one of the purchasers of the Covent Garden Theatre and held the office of acting manager for seven years. In 1777 he purchased the Haymarket Theatre. Colman wrote and adapted upward of 30 dramatic pieces. He also translated Terence, edited Beaumont and Fletcher, and wrote considerable other verse and prose. Consult George Colman (2d), *Random Records* (1830), and Peake, *Memoirs of the Colman Family* (London, 1841).

COLMAN, George, called The Younger (1762–1836). An English dramatist and miscellanist, son of George Colman. His bent lay in the same direction as his father's, during whose last years he acted as manager of the Haymarket Theatre. On the death of the elder Colman, George III transferred the patent to his son. After 1824 Colman held the office of examiner of plays. In industry he rivaled his father, and he received large sums for his plays, of which the best known are *John Bull* and *The Heir-at-Law*. He wrote many humorous poems, among which were *Broad Grins* (1802) and *Poetical Vagaries* (1812). In 1830 he published an amusing autobiography, *Random Recollections*.

COLMAN, Norman J. (1827–1911). The first Secretary of Agriculture of the United States. He was born on a farm near Richfield Springs, N. Y., May 16, 1827. In 1847 he removed to Louisville, Ky., and he afterward practiced law in New Albany, Ind., and in St. Louis, Mo. He served in the Union army during the Civil War as lieutenant colonel of volunteers. In 1865 he established an agricultural paper, *Colman's Rural World*, which he continued to edit to the close of his life. In 1874 he was elected Lieutenant Governor of Missouri and in 1885 was appointed United States Commissioner of Agriculture. Towards the end of his term he was appointed Secretary of Agriculture, under the law reorganizing the Department of Agriculture.

COLMAN, Samuel (1832–1920). An American landscape painter. He was born in Portland, Me., and studied first in New York under Durand and later in France, Spain, Rome, and Dresden. After traveling extensively he returned to New York and was one of the founders of the American Water-Color Society, and its first president (1866–67). His early landscapes are in the style of the Hudson River school (q.v.), but later show the influence of Turner and Achenbach. They display no special originality or technical ability, but are mellow in tone and good in color. Examples of his work are found in the Metropolitan Museum, New York, and in the Art Institute, Chicago. Consult his biography by Koehler, in *American Art Review* (Boston, 1880), and Isham, *History of American Painting* (New York, 1905).

COLMAR'. See Kolmar.

COLNE, kōln *or* kōn. A market town of Lancashire, England, on a branch of the Calder, 32 miles north of Manchester (Map: England, D 3). Colne was incorporated in 1895, has an excellent modern system of sewage disposal, and maintains a public library, markets, and slaughterhouses. It has manufactures of cotton, calicoes, and mousselines de laine. There are also numerous collieries and limestone and slate quarries in the vicinity. Pop., 1901, 23,000; 1911, 25,689. Colne is very ancient and is supposed by some to be the *Colunio* of the Romans.

COL'OCA'SIA. See Cocco; Tara; Taro.

CO'LOCO'LO. A wildcat of South America, related to the ocelot (q.v.).

CO'LOCOTRO'NIS. See Kolokotronis.

COL'OCYNTH (OF. *coloquinte*, from Lat. *colocynthis*, from Gk. κολοκυνθίς, *kolokynthis*, colocynth, from κολοκύνθη, *kolokynthē*, pumpkin), or Bitter Apple. A well-known medicine, much used as a purgative. It is the dried pulp of the colocynth gourd, colquintida, bitter apple, or bitter cucumber, a globose fruit about the size of an orange, of a uniform yellow color, with a smooth, thin, solid rind. The plant which produces it, *Citrullus colocynthis*, is allied to the cucumber (q.v.). It is common in Turkey, the Grecian Archipelago, various parts of Asia, and in Africa and Spain, which last country supplies no small part of the colocynth of commerce. The fruit is gathered when it begins to turn yellow, peeled, and dried quickly either in a stove or in the sun. It is chiefly in the form of a dry extract that it is used in medicine. It owes its properties to a bitter principle called *colocynthin*, a bitter glucoside having the chemical formula $C_{56}H_{84}O_{23}$. It is a curious, though not unique, fact that the seeds of the colocynth plant, produced in the midst of its medicinal pulp, are perfectly bland, and they even form an important article of food in the north of Africa. The name "false colocynth" is sometimes given to the orange gourd (*Cucurbita aurantia*), sometimes cultivated as an ornamental plant in our gardens, on account of its globose, deep-orange fruit. The pulp of the fruit possesses the properties of colocynth, but in a milder degree. Colocynth is generally administered in the form of pills, in which the extract is associated with aloes, scammony, and in some cases with calomel or with extract of hyoscyamus. In small doses colocynth acts as a safe and useful purgative; when accompanied by hyoscyamus, the latter prevents much of the pain and griping which are attendant on the use of colocynth by itself. It is a drastic purgative, acting upon the whole intestine, and is used only in obstinate cases of chronic constipation. Colocynth is an ingredient of some powders for destroying moths. In large doses colocynth is a poison, causing severe inflammation of the stomach and intestine. The medicinal dose is from 2 to 8 grains; that of the official extract from ½ to 2 grains; that of the compound extract from 5 to 15 grains.

COLOGARITHM. See Arithmetic Complements.

COLOGNE, kō-lōn' (Ger. *Köln*, officially *Cöln;* the *Colonia Agrippina* of the Romans).

The largest city of Rhenish Prussia, and the sixth largest in Germany, on the left bank of the Rhine, in lat. 50° 56′ N., long. 6° 58′ E. (Map: Prussia, B 3). It is 44 miles by rail northeast of Aachen, 57 miles north-northwest of Coblentz, and 24 miles southeast of Düsseldorf. Cologne is a fortress of the first rank, its fortifications forming a semicircle, with the Rhine as its chord, and the former town of Deutz (since 1888 included in Cologne) on the opposite bank, as a tête-de-pont. It is connected with this suburb by a bridge of boats and a splendid iron bridge for railway and wagon traffic, completed in 1910 and replacing the notable iron bridge built in 1855–59. Still another bridge was completed in 1910, for railway and wagon traffic, at the southern end of the city. In the old quarter the streets are narrow and crooked, but the main residential quarter presents a thoroughly modern aspect. The Ringstrasse, a stately boulevard, nearly 4 miles long, occupies the site of the ancient walls, dismantled in 1881–85. A new line of fortifications established beyond the Ringstrasse embraces 1000 acres and has nearly doubled the city's area.

Among the public buildings the churches claim the greatest share of attention, the splendid specimens of the Romanesque period being more numerous than in any other city in the world. The oldest is perhaps the church of St. Gereon, said to have been founded by the Empress Helena; the choir, with its two square towers, was added in the eleventh century, and the decagonal nave dates from 1219–27. St. Maria im Capitol, consecrated in 1049 and considered by some as the oldest church in Cologne, is a cruciform basilica of imposing appearance. The interior is decorated with fine frescoes. The Apostles' Church, a remarkably fine basilica, presents the best specimen of the highly developed style of architecture in which ecclesiastical enthusiasm and civic love of splendor found expression towards the end of the twelfth century; and the church of St. Cunibert, dating from 1247, is a prominent example of the Byzantine-Moorish style. The church of St. Martin was consecrated in 1172; its massive eastern portion has an imposing tower, 270 feet high. The Jesuits' Church, erected in 1618–29, may be mentioned as an excellent specimen of the mingled style peculiar to that order. The church of St. Peter, in late Gothic style, is celebrated for the altarpiece of the crucifixion of St. Peter by Rubens, and that of the Minorites for containing the tomb of the famous scholastic Duns Scotus. St. Ursula is another church of historic interest. Most of these edifices underwent complete restoration during the nineteenth century. The newer ecclesiastical edifices include a handsome Roman Catholic church in Deutz (1896) and a large synagogue in the new section west of the Ringstrasse (1899).

The Cathedral. The chief object of interest in the city, however, as well as its greatest ornament, is the cathedral, Germany's grandest church building, and one of the noblest specimens of Gothic architecture in Europe. It is said to have had its origin in a structure erected at the beginning of the ninth century by Archbishop Hildebold. This was burned in 1248, and the present cathedral was begun in the same year by Archbishop Konrad von Hochstaden. The design is modeled upon that of Amiens Cathedral, and the architect may have been Master Gerhard von Rile, who is mentioned as conducting the building operations. The choir, the first part completed, was consecrated in 1322. The work was carried on intermittently till the era of the Reformation, when it was suspended, and during the subsequent centuries not only was nothing done to advance it, but the uncompleted structure was suffered to decay. In the beginning of the nineteenth century, however, attention was attracted to its incomplete state, especially by the brothers Boisserée (q.v.); and it became the subject of an enthusiasm extending over all Germany, giving birth to a multitude of associations for the supply of the necessary funds to repair and complete it according to the original designs, which had fortunately survived. On Sept. 4, 1842, the King of Prussia, who had contributed largely to the funds, laid the foundation stone of the transept, from which time great progress was made. The naves, aisles, and transepts were completed in 1848, the magnificent south portal in 1859, and in 1860 the iron central spire was added. With the exception of the towers, the whole was finally completed in October, 1863. The towers, its most impressive and dominating feature, were finished in 1880, and on the 15th of October the completion of this grand work was celebrated with great splendor in the presence of Emperor William I and most of the sovereign princes of the German Empire. The cathedral has a length of 443 feet and a width of 200 feet; the height of the roof is 201 feet, that of the central tower over the crossing 357 feet, and of the two main towers 512 feet. The great bell of the south tower, the "Kaiserglocke," cast in 1874 from conquered French cannon, is the largest and heaviest in the world. The interior is particularly impressive by reason of its soaring height, and the stained glasses are among the finest modern specimens of that art in Germany. It contains the relics and shrine of the "Three Magians," which, since their acquisition in 1164, have been the goal of countless pilgrimages. Consult the monumental monograph on Cologne Cathedral by Boisserée (Munich, 1842), and those of Fahne (Düsseldorf, 1849), Bock (Cologne, 1874), Schmitz (ib., 1868–76), Lamprecht (Bonn, 1881), Wiethase (Frankfort, 1884–89), and Helmken (Cologne, 1899).

The most noteworthy secular edifices are: the Rathaus, the central and oldest portion of which dates from the fourteenth century and contains the handsomely restored Hansa Saal, in which the first general meeting of the Hanseatic League was held in 1367. The graceful portico in Renaissance style and the splendid five-storied tower deserve attention. South of the Rathaus rises the imposing structure of the Gürzenich, erected in 1441–52 as a festive hall for the entertainment of distinguished guests by the City Council, and first used for that purpose at the grand festival held in honor of Emperor Frederick III in 1475. Thoroughly renovated in 1856, it is now the most splendid among the old secular structures, and since 1875 has been used as a stock exchange. The Templars' Lodge, the ancestral seat of the Overstolzen, a distinguished family of mediæval Cologne, is a fine Romanesque building of the twelfth or thirteenth century, now used by the Chamber of Commerce. Of the numerous modern public buildings the most prominent are: the palatial government buildings (1830); the Municipal Museum

COLOGNE

CATHEDRAL RATHAUS

(1855–61); the Stadttheater (1872); the Court of Justice (1886–93), an extensive Renaissance structure, with an impressive façade and handsome staircase; the imposing new post office (1893); and the Imperial Bank (1897). A handsome central railway station was built in 1889–94. The city contains many fine monuments, including statues of Frederick William III, Johann von Werth, and Bismarck.

Cologne is administered by an *Oberburgermeister*, appointed for a period of 12 years and assisted by 11 associates. The municipality operates successfully its own gas and water works, as well as an electric-lighting plant. The street railways are operated by a private company, whose franchise expires in 1916, when the lines will be turned over to the municipality without compensation. The municipality also owns and maintains a pawnshop and slaughterhouses. The educational establishments of Cologne include four gymnasia, a realgymnasium, an oberrealschule, and a realschule; also an academy of medicine, a commercial high school, a theological and a teachers' seminary, a conservatory of music, and a girls' gymnasium. The municipal library contains over 185,000 volumes, and the museum has a number of valuable collections. The zoölogical garden, opened in 1860, is one of the finest in Europe. The industries of Cologne are extensive and varied. The industrial establishments include sugar refineries, chocolate factories, cigar factories, tanneries, machine shops, paper mills, flour mills, breweries, distilleries, and several factories producing the celebrated eau de Cologne. The commerce, both by rail and by Rhine steamboats, is very great. A fine modern harbor, with extensive quayage, has been constructed. The population of Cologne has greatly increased since 1888, when outlying districts began to be annexed to the city. In that year the population numbered 144,772; it rose to 281,681 in 1890, and 372,229 in 1900. The census of Dec. 1, 1910, returned 516,527 inhabitants (about five-sixths Roman Catholics); the area of the city at that time was 117 square kilometers (45 square miles).

Cologne was originally a town of the German tribe of the Ubii (*Oppidum Ubiorum*). It received the name of Colonia Agrippina, 50 A.D., from Agrippina, the wife of the Emperor Claudius, who planted a colony of Roman veterans on the spot, which was her native place. It grew to be an important city under the Romans and retained its prominence under the Frankish sway. The bishopric of Cologne, instituted in Roman times, was elevated to the rank of an archiepiscopal see by Charles the Great in 785. At this time the city was a busy seat of commerce. It entered the league of the Hansa towns in the beginning of the thirteenth century and contended with Lübeck for the first rank. The archbishops acquired considerable territory, and some of them distinguished themselves as politicians and warriors. They took their places among the great princes and electors of the Empire, but were involved in a protracted contest with the citizens of Cologne, who successfully asserted against them the independence of the city. Within the city a bitter contest was carried on all through the Middle Ages between the small number of merchant princes and the trade guilds. The Reformation made little progress in Cologne, and the Protestants were treated with intolerance. With the sixteenth century began a process of steady decline, which remained unchecked till after the end of the Napoleonic wars, when a new period of industrial prosperity set in. In the course of the wars of the Revolution the city lost its independence, to become part of France, and on the downfall of Napoleon it was annexed to Prussia. The archbishopric was secularized in 1801–03, and the Congress of Vienna assigned all of its territories to Prussia. A new archiepiscopal see was created in 1824. Consult: Ennen, *Geschichte der Stadt Köln* (5 vols., Cologne, 1862–80); Heldmann, *Der Kölngau und die Civitas Köln* (Halle, 1900); Binterim and Moosen, *Die Erddiözese Köln bis zur französischen Staatsumwalzung* (2 vols., Düsseldorf, 1892–93); *Die Chroniken der niederrheinischen Städte: Cöln* (3 vols., Leipzig, 1875–77).

COLOGNE, Eau de. See Eau de Cologne.

COLOGNE, The Three Kings of. The three wise men, or magi, by name Melchior, Kaspar, and Balthazar, who followed the star from the East to where it rested above the new-born Jesus. Their bones are said to have been placed in Cologne Cathedral, and their skulls were exhibited there as late as the eighteenth century. Those who touched them were supposed to be healed of their diseases. The names of the three kings were also used as a charm.

COLOGNE YELLOW. A yellow pigment made by precipitating a mixture of lead and calcium nitrates with sodium sulphate and potassium chromate. It is essentially a chrome yellow in which the intensity of the color is lessened by the calcium salt.

COLOMB, kō-lōm′, Philip Howard (1831–99). A British admiral, born in Galloway, Scotland, the son of an army officer. He entered the navy in 1846 and saw varied service, against Chinese pirates in 1848–51, in the Burmese War in 1852, in the Arctic relief expedition of 1854, in the English attack on Sveaborg in 1855, and in suppressing the slave trade in 1868–70—the subject of his interesting book *Slave-Catching in the Indian Ocean* (1873). After his superannuation (1886) he became rear admiral (1887) and vice admiral (1892). In 1858–67 he attempted to make the Real cone signals practical, and, failing, perfected the system of flash signals adopted by the British navy in the latter year. He did equally important work in revising evolutions for steam warships, and the Washington Conference of 1889 adopted a code of marine regulations based upon his study of maritime collisions and contradictory "rules of the road." His great book on *Naval Warfare* (1891; 3d ed., 1900) developed independently the same thesis as Captain Mahan's works on sea power—the prime importance of the command of the sea. He wrote *Memoirs of Sir Astley Cooper Key* (1898).

COLOMBA. See Calumba.

COLOM′BA. A story of Corsica, by Prosper Mérimée (1840). It is considered his masterpiece.

COLOMBAT DE L'ISÈRE, kô′lôN′bȧ′ de lē′zâr′ (1798–1851). A French physician, born at Vienne, Department of Isère. He devoted himself to the study of defects of speech and established in Paris an institute for the correction of stuttering, on the principle of rhythmic pronunciation. His best-known work, entitled *Traité de tous les vices de la parole et en particulier du bégaiement* (1830), passed through several editions. He wrote also *Traité des maladies des femmes et de l'hygiène spéciale de leur*

sexe (1839–43); and *Memoire sur l'histoire physiologique da la ventriloquie* (1840). In recognition of his fruitful services the Academy of Sciences awarded him a prize of 50,000 francs.

COLOMBES, kô'lôNb'. A town in the Department of Seine, France, suburban to Paris, 3 miles northwest of the city walls. It has manufactures of starch, gelatin, oil, vinegar, measuring instruments, and woolens; there are also petroleum refineries, etc. Pop., 1901, 23,061; 1911, 22,862.

COLOM'BIA (so called in honor of Christopher Columbus). A republic in South America, occupying the northwest corner of the continent and bounded by the Caribbean Sea and Venezuela on the north, Venezuela and Brazil on the east, Ecuador on the south, and the Pacific and the Republic of Panama on the west. It lies between lat. 3° S. and 12° 30′ N. and between long. 67° 30′ and 83° W. The area was estimated in the census of 1912 at 461,606 square miles.

Topography. Colombia may be divided into two natural regions—the Andean Cordilleras and the great plains or llanos of the east. Entering Colombia from Ecuador, the Cordilleras are continued in a general northerly direction by three diverging ranges, which spread out over the entire western section of the country. The Western Cordillera constitutes a long mountain ridge, with summits 10,000 to 11,000 feet in altitude, which is defined on the east by the valley of the Cauca River. In the northern part the chain is flanked on the west by the Cordillera del Chocó. The Central Cordillera, the continuation of the Eastern Cordillera of Ecuador, contains the highest peaks in Colombia, including the volcanoes Huila, Puracé, and Tolima, the last reaching an altitude of 18,432 feet. The Eastern Cordillera, separated from the central range by the Magdalena River, attains an extreme elevation of 16,700 feet and has great table-lands that are the most thickly populated regions in the republic. This chain divides at the north, the eastern range extending into Venezuela, and the western, known as the Sierra de Perijá, running northward and merging into the Sierra Nevada de Santa Marta, near the coast. The llanos east of the Cordilleras have a surface tilted towards the Atlantic. They cover the northeastern portion of Colombia, comprising the entire basin of the Meta River and extending as far south as the Guaviare River. Their grazing land is rich and well watered. The forest belt lies south of these plains.

Colombia has a coast line of over 3600 miles, of which more than 1600 miles are on the Pacific. Omitting minor sinuosities the Pacific coast line is about 500 miles and that of the Caribbean about 700. The shores are very irregular and form better harbors on the west than on the north. The region abounds in long rivers. The Magdalena traverses the country through almost its entire north-south length and receives numerous tributaries. Navigation is occasionally impeded by rapids. La Dorada is its head for steamers, although the river is navigable for 900 miles from its mouth. The Atrato flows north not far from the west coast and enters the Gulf of Darien. The eastern plain, belonging to the basins of the Orinoco (which forms part of the eastern boundary) and the Amazon, is crossed by many long rivers. The chief affluents of the Orinoco are the Guaviare and the Meta; of the Amazon, the Uaupés and the Yapurá (or Caquetá).

In the Cordilleras the climate is moderate in the upper regions, but very hot in the valleys.

The belt of greatest heat lies south of the llanos. On the table-lands of the Cordilleras the mercury occasionally falls as low as 44° F. In the mountainous parts there are two rainy seasons; on the coast rains occur at any time of the year. Generally speaking, the country is healthful.

Flora. In the low regions plant life is purely tropical. Palms are very numerous and include the lofty wax palm (*Ceroxylon andicola*). Of the more useful forest trees of this region is the rubber (*Castilloa elastica*). The mountain slopes are mostly clothed with thick forests, the timber line being above 10,000 feet. Dye and cedar woods, as well as copaiba trees, grow naturally in Colombia. Cinchona trees of several species are found between 7000 and 9000 feet above the sea, and the aloe, the sarsaparilla, and other medicinal plants grow in abundance. Cacao is cultivated mainly in the provinces of Cauca and Tohina. Other Colombian products are coffee, sugar, and indigo. Cotton and tobacco are also grown.

Fauna. The fauna is also of great variety and includes the larger South American mammalian types, such as the jaguar, puma, tapir, anteater, sloth, several species of monkey, and one or more species of red deer (on the plateaus). The condor, vulture, numerous toucans and parrots, and a variety of humming birds are a part of the rich avifauna. Serpents of several kinds are found in the torrid regions. Fishing is carried on along the banks of the Magdalena and Orinoco.

Geology. The mountain regions here have long been the seat of great volcanic activity. The chief formations in the central range are granite, gneiss, basalt, and eruptive rocks, while in the eastern range Cretaceous formations predominate. The entire portion east of the Cordilleras is occupied by the llanos—vast treeless plains having an altitude of from 1000 to 1500 feet and well adapted for pasturing.

Mineral Resources. Colombia is very rich in minerals, especially in precious metals. Gold is found mostly in alluvial deposits and in the streams. During the Spanish régime the proceeds from the gold mines constituted the chief revenue, but the extracting was carried on by most primitive means. Modern methods were introduced only during the last quarter of the nineteenth century, though the principal mines have long been operated by English companies. The chief centre of gold mining is Antioquia. The leading silver mines are in Tolima and Cauca. The annual gold output of the country amounts to over $3,000,000. The other mineral resources—iron, copper, platinum, lead, and salt—are little developed. Emeralds are mined in the Department of Boyacá, the mines of Muzo and Cosquez being the most noteworthy. Salt mining, a government monopoly, is carried on chiefly around Zipaquirá and Nemocón, in Cundinamarca, where salt is found both in rock form and in springs. Coal exists in the Eastern Cordillera and in many other parts, but is as yet scarcely touched.

Agriculture. The principal industry of Colombia is agriculture, which is greatly favored by the soil and climate, but is carried on by primitive methods. Cultivation is confined mainly to the elevated plateau of the western part, which is best adapted to settlement by

European immigrants on account of the salubrious climate. In the hot districts the important crops include coffee, tobacco, sugar, and cacao. Tobacco, and especially coffee, are largely exported. In the less torrid regions the agriculture is more European in character, wheat, corn, and barley being leading crops. The banana tree is found throughout the republic, and the fruit is exported in large quantities, mostly to the United States. The import records of the United States show an annual average of about a half million dollars worth of this fruit from Colombia. The absence of adequate transportation facilities and the sparseness of population are such hindrances to agriculture that the total yield of the food crops is not sufficient, and it is cheaper for the coast towns to bring wheat from New York than from the interior plateau to satisfy the home demand. The rubber tree and the copaiba tree grow wild and are tapped. The uplands are the home of the tolu, well known for its balsam. Cattle raising is conducted on a considerable scale. Cattle hides are an important export, the export to the United States being about one million dollars annually.

Manufactures. The manufacturing industries are insignificant. There are iron works near Bogotá, and pottery is made at Espinal, in Tolima. There are woolen mills at Popayán and Pasto. The Indians make pottery, cotton fabrics, and straw mats and hats. The manufacture of "Panama" hats from the jipijapa fibre is carried on as a domestic industry in many localities. The sugar mills are of the most primitive kind. The industry of wood carving and horn carving, once well developed among the aboriginal population, is gradually dying out. The distilling of liquor from sugar is a government monopoly.

Transportation and Communication. Owing to its mountainous surface, Colombia is very deficient in roads. Communication is mostly maintained by means of narrow paths accessible only to pack mules, and even the principal roads are often in an almost impassable condition. The lack of good roads is partly remedied by the navigable waterways. The Magdalena chiefly and the Atrato, Cauca, and a number of minor streams are utilized for transportation, while through the river Meta communication is had with the Orinoco. The construction of railways in the republic has been very slow and irregular. There were in 1911 about 620 miles in operation. Some lines are operated by American companies, and others are managed by the states with the assistance of the central government. These short lines—ranging from 25 to 100 miles in length and forming no connected system—have little influence on the general economic conditions of the republic. Telegraph lines in 1912 aggregated upward of 11,800 miles chiefly owned by the government. The republic is in regular steamer communication with Europe and the United States. There are over 600 post offices. The postal service is poor.

Commerce. The commerce of Colombia, like its industries, has been hindered by lack of transportation facilities, the frequency of political disturbances, and the heavy export and import duties. Chief exports are coffee, gold bars and dust, cattle hides, bananas, "Panama" hats, rubber, and ivory nuts. Leading imports are petroleum, flour, cottons, wine, iron and steel wares, drugs and chemicals. Imports increased in value from about $12,000,000 in 1909 to nearly $24,000,000 in 1912, and exports from about $16,000,000 to over $32,000,000. Over half of the latter figure represented coffee. In 1912 the United Kingdom sent imports and received exports valued at $7,839,000 and $4,376,000 respectively; United States, $7,612,000 and $15,833,000; Germany, $4,201,000 and $1,854.000. Exports of the United States to Colombia have grown from $3,084,718 in 1907 to $7,397,696 in 1913 and imports therefrom from $6,308,680 to $15,992,321. About 30 per cent of the imports are from the United States and 45 per cent of the exports are sent to that country. The commerce between Colombia and the other South American countries, excepting Venezuela, is insignificant. The inland trade, owing to the great variety in the products of the different portions of the republic, is active and carried on chiefly by means of weekly markets.

Government. Colombia has practically had a republican form of government since 1819. The constitution of 1886 (the seventh since 1821) underwent radical changes in 1905 and 1909. In contrast with the preceding instruments, which recognized the sovereignty of the constituent states, it provides for a strong centralization of power, and under it the name of the country was changed from the "United States of Colombia" to the "Republic of Colombia." Under the constitution the legislative power is vested in a congress consisting of the Senate (35 members, elected indirectly for four years) and the House of Representatives (92 members, elected for four years by direct vote). The president is elected by the congress for four years, and is assisted by a cabinet of seven ministers. The president for the term ending in August, 1914, was Carlos E. Restrepo. The departments have councils elected by the people at the rate of one member for every 25,000 inhabitants, and are divided into provinces presided over by prefects appointed by the governor. For the administration of justice there are a supreme court of seven judges, appointed by the president, district supreme courts, and provincial courts. Military service is nominally compulsory, but is not generally enforced. The peace effective is about 6000 officers and men; the war strength is estimated at about 50,000. A military school, with a course of four years, is maintained at Bogotá.

Finance. The finances of the republic have always been in a deplorable condition. The public debt has constantly increased. The internal debt in 1904 was the paper currency, 746,801,420 pesos, and 7,398,817 pesos additional. The external debt, held chiefly in Great Britain, amounted in 1896, with arrears, to $17,080,188. By an arrangement with the bondholders in 1897 the government was able to cut the external debt down to £2,700,000 ($13,122,000), and new bonds were issued to that amount at 1½ per cent interest, the rate to be gradually increased to 3 per cent. This programme was satisfactorily carried out until the civil troubles of 1899. On Jan. 1, 1912, the foreign consolidated debt stood at £2,486,000 (in addition, guarantee railway debts amounting to £1,469,400). On July 1, 1912, the internal debt was 5,476,888 pesos silver; floating debt, $2,756,545; in addition is the enormous outstanding paper currency. The revenue is derived from import and export duties and monopolies (salt, liquors, cigars, etc.). For 1912, estimated revenue and expenditure were $12,043,145 and $12,500,000; 1913, $14,070,654

and $14,060,294. The departments are independent in their internal financial affairs and derive their revenues chiefly from monopolies. The currency of the country consists of the depreciated paper pesos. The gold peso is equivalent to the United States gold dollar, the silver peso fluctuates with the price of silver, and the paper peso is legally current at one cent.

Population. The census of 1870 returned a population of 2,951,323. From that time no census was taken until March 5, 1912, for which date the population is returned at 5,472,604. The latter figure includes an estimated 400,000 for Panama, sovereignty over which Colombia still claimed. On the other hand, it does not include a considerable number of uncivilized Indians; the number is quite unknown, but has been surmised to be about 30,000. Total population (1918), 5,847,491. Population by departments, etc. (1912), was as follows:

	Sq. miles	Pop.	Capitals
Departments:			
Antioquia	22,752	740,937	Medellín
Atlántico	1,008	114,887	Barranquilla
Bolívar	22,320	420,730	Cartagena
Boyacá	16,460	586,499	Tunja

The larger municipal populations in 1912 were: Bogotá (the capital), 121,257; Medellín, 71,004; Barranquilla, 48,907; Cartagena, 36,632; Manizales, 34,720; Sonsón, 29,346; Pasto, 27,760; Cali, 27,747; Aguadas, 26,423; Ibagué, 24,693; Palmira, 24,312; Neiva, 21,852. The language and civilization are Spanish; persons of pure Indian blood number perhaps 15 per cent of the total population, and of pure white blood 10 per cent.

Education and Religion. Education is free, but not compulsory, and is to a large extent maintained by the state. Besides the university at Bogotá, there are a national institute for working people, a school of arts and trades, and a national school of music. Secondary education is directed largely by the religious orders. There are over 4000 primary schools, with nearly 300,000 pupils. Religious toleration and free speech are guaranteed by the constitution; but the state religion is Roman Catholicism.

History. The north coasts of Colombia were visited by Ojeda and Vespucci in 1499. Three years later Columbus explored a section of the country and attempted to found the first Spanish colony on the American mainland. Between 1511 and 1517 Balboa and Pedrarias explored and settled both coasts of the Isthmus. As early as 1515 Pizarro and Gaspar de Morales had explored the Pacific coast as far south as "Biru," a term from which the present territory of Peru gets its name, although lying considerably beyond Pizarro's "Biru." Between 1536 and 1540 Ximenes de Quesada conquered the Chibchas, or Muyscas, the principal nation, and the country became a dependency of Spain. It was known as the Province of New Granada till 1718, when it was made a viceroyalty. With the other Spanish possessions, it revolted in 1810 and in 1819 became independent, joining with Venezuela (1819), under the leadership of Bolívar, and Ecuador (1822) to form the Republic of Colombia. This union was dissolved in 1829–30, and New Granada was founded as a separate republic in 1831. A new constitution was adopted in 1858, by which the separate "provinces" were changed into "states," associated under a federal government, known as "Confederación Granadina." The states were made self-governing in all internal affairs. In 1860 another revolution broke out, and for more than two years the country was devastated by civil war. Finally, in 1863, the nine states again agreed upon a constitution, organizing themselves under the name of "United States of Colombia." Another revolution, begun in 1884, was terminated in 1886 by the promulgation of a new constitution, which transformed the loose federal union into a strongly centralized state. In 1889 the insurrectionary elements reappeared, but were suppressed before they had gathered headway. A year later there was a more formidable outbreak, with severe fighting at Panama. The insurrection was due in great measure to a general feeling of discontent aroused by the corrupt conduct of the Conservative party, which was then in power. In August, 1900, the Vice President, Marroquin, made himself master of the government, and carried on an energetic campaign against the Liberals. Late in 1901 Colón was taken by the Liberals, who, however, were compelled to evacuate it within a few days. Peace was concluded through the intercession of the United States in the fall of 1902. In September, 1903, the Colombian Congress rejected the Hay-Herran Treaty with the United States for the construction of the Panama Canal. This was followed by a proclamation of independence on the part of Panama on November 3. (See PANAMA.) The rôle played by the United States in the Isthmian revolution aroused bitter resentment in Colombia. President Marroquin in vain pledged himself to conclude a new treaty on terms satisfactory to the United States government. A conciliatory mission to Washington headed by Dr. Reyes was likewise without result. In 1904 Dr. Reyes became President and forthwith attempted to install himself as a dictator. Congress was dismissed, a new constituent assembly summoned, and the presidential term lengthened to 10 years. Reyes proved a success in developing Colombia's economic resources, but became unpopular by attempting to reopen negotiations with the United States, and fled, in 1909, to England. His successor, Restrepo, began his administration as a violent anti-American, but has changed his policy, and in 1913 Colombia renewed her efforts to obtain indemnity for the loss of Panama. A new treaty was negotiated with the United States authorities, which was unofficially stated to include an indemnity payment by the United States of $25,000,000 and certain privileges to Colombian vessels passing through the canal, but has not yet been sub-

mitted to the Congress of the United States and its exact provisions cannot therefore be stated. With the opening of 1914, the Colombians, despairing of their hopes, are hinting that they will build a canal of their own with British capital.

Consult: Nuñez and Jalhay, *La république de Colombie: Géographie, histoire, organisation, etc.* (Brussels, 1893); Regel, *Kolumbien* (Berlin, 1899); Scruggs, *The Colombian and Venezuelan Republics* (Boston, 1905); Wheeler, *The Agricultural Condition of Colombia* (London, 1889); Röthlisberger, *El Dorado: Reise- und Kulturbilder aus dem südamerikanischen Columbien* (Bern, 1897); Dawson, *South American Republics* (New York, 1904); Pedraza, *Republica de Colombia* (Norwood, Mass., 1909); Serret, *Voyage en Colombia* (Paris, 1912).

The standard work on the history of Colombia is Pereira, *Les Etats-Unis de Colombia* (Paris, 1883). There are numerous narratives of events of the war against Spain, written by English officers serving with the Revolutionists, of which the best are, perhaps, Hall, *Present State of Colombia* (London, 1825), and the anonymous *Recollections of a Service in Venezuela and Colombia* (ib., 1828).

COLOMBO, kō-lōm'bō. The capital and chief seaport of Ceylon, situated on the western coast of the island, on a rocky headland, in lat. 6° 54′ N. and long. 79° 51′ E. (Map: India, C 7). The European part of the city is magnificently laid out, with broad avenues shaded by tropical trees and lined by modern buildings of fine architecture. The business part of the European city occupies the site of a fort founded by the Portuguese and rebuilt by the Dutch, and is still known as the "Fort." Its chief thoroughfare is Queen Street, in which are situated the governor's residence, the chief mercantile houses and banks, and the post office, the finest public building on the island. The residential section of the European city covers an area of about 20 square miles. The part nearest to the water is occupied by numerous clubs. Farther inland this section is crossed by beautiful roads bordered with bungalows amid luxuriant gardens. The native part of the city, or *Pettah,* is dirty and crowded, with crooked and narrow streets, always thronged with motley crowds of different types and nationalities. The houses are without doors or windows, and the passer-by can freely observe the private life of the natives. Colombo owes its commercial importance largely to its breakwaters. The southwest breakwater, one of the largest in existence, was begun in 1875 and completed in 1885; it is 4212 feet long and is built of concrete blocks weighing from 18 to 30 tons. The northeast and northwest breakwaters are rubble embankments, begun in 1894 and finished in 1906; the former is 1100 feet and the latter 2657 feet long. The three breakwaters inclose an area of about 640 acres, with a depth of from 30 to 36 feet at low water. In addition there is a graving dock 700 feet long. The shipping of the port of Colombo is very extensive, nearly the whole of the imports and exports of Ceylon passing through it. Colombo is one of the most important coaling stations for British and foreign steamers on the Australian and East Asiatic routes. It is connected by rail with Kandy, Galle, and the north of the island. It is the seat of a United States consulate.

The population of Colombo in 1901 was 158,228 (127,836 in 1891), including about 5000 Europeans, chiefly Englishmen and descendants of the Dutch, and a number of Parsis, Jews, Arabs, Tamils, descendants of Portuguese, and mixed breeds, many of whom live in houses made of mud. The 1911 census showed a population of 213,396. The natives are mostly artisans and laborers, while the Europeans are either owners of large plantations or merchants.

The early name of Colombo, Kalan-totta, the "Kalany ferry," derived from its proximity to the river, the Arabs corrupted into Kalambu. At the arrival of the Portuguese, in 1517, Kalambu had merged into Kolamba, or Columbu, which they henceforth wrote Colombo, in honor of Christopher Columbus. It was taken by the Dutch in 1656 and by the British in 1796. Consult Caye, *Golden Tips* (London, 1900).

CO'LON (Lat., from Gk. κόλον, *kolon*). The portion of the large intestine that extends from the cæcum (q.v.) to the rectum, which is the terminal portion of the intestinal canal. It is divided into the ascending, the transverse, and descending colon, and the sigmoid flexure. See ALIMENTARY SYSTEM; and, for illustration, ABDOMEN.

The whole length of the colon, from its commencement in the cæcum to its termination in the rectum, is rather more than 4 feet. It is retained in its position by the serous membrane, which envelops, partly or completely, all the intestinal viscera and is termed the peritoneum (q.v.). Its structure is essentially the same as that of the rest of the intestinal canal, which is described in the article DIGESTION, ORGANS AND PROCESS OF; but in consequence of a peculiar arrangement of the longitudinal muscular fibres, the interior of the colon is divided into sacculi, which serve to retain its contents for a longer period than if it were a uniform tube, and thus, by extracting water from them, to reduce them to a more solid consistence, such as is possessed by normal excrement. It is also devoid of villi, and it is of much greater diameter than the small intestine. In some animals, as in the horse and sheep, the shape of the fæces is completely molded in these cells.

COLÓN, kō-lōn'. A seaport city of Panama, on the Caribbean shore, about 48 miles by rail northwest of the city of Panama (Map: Central America, H 6). Colón, geographically within the Canal Zone, is situated on Manzanillo Island, between Manzanillo Bay and Limón Bay. It is the northern terminus of the Panama Railway and the Panama Canal. Practically all of the land in the city is owned by the Panama Railroad, under its original franchise from the United States of Colombia, and as the United States now owns the Panama Railroad it has thus become the owner of the land, but cannot sell it. Adjacent to Colón, on Limón Bay and practically forming a part of the city, is the American town of Cristobal, where are located the great cold-storage plant of the Isthmian Canal Commission and the shops of the Panama Railroad. The deep but exposed harbor of Colón, in Limón Bay, is naturally much inferior to that of Porto Bello, 20 miles to the east, but has been improved by a long breakwater from Toro Point erected by the Canal Commission. Steamships can come alongside the piers, and the docking equipments are modern, including cranes and other apparatus. In 1914 Colón was either the terminus or a port of call for about a dozen lines of steamships, and, on

account of the approaching completion of the canal, other lines were in project. The city has served as an entrepôt for much of the commerce between Atlantic and Pacific ports. During 1912 there entered at Colón and Cristobal 877 steamships, of 3,330,600 tons, and 32 sail, of 5200 tons. Colón consists largely of unattractive frame houses and small shops, but many of the newer houses, including the modern municipal building and the principal public school, are of concrete. Under the Treaty of 1903 the cities of Colón and Panama, while remaining Panaman territory, came under the jurisdiction of the United States in all matters relating to sanitation and quarantine. Formerly Colón was a notoriously unhealthful place, but the unsanitary conditions were removed by the Canal Commission in 1906–07; sewers and a system of water works were constructed and stringent sanitary regulations established. Unlike Panama, Colón is not an old city, having been founded in 1850 by the builders of the Panama Railroad (which was completed in 1855). For a time it was called "Aspinwall," in honor of William H. Aspinwall, one of the builders of the railroad, but subsequently the name was changed by statute to "Colón," in honor of Christopher Columbus, who sailed into Limón Bay in 1502. A fine statue of Columbus, the gift of Empress Eugénie in 1870, stands near the mouth of the old (French) canal. The town has suffered frequently from fires, notably during the revolution of 1885. When the Canal Commission undertook its work, the population of Colón was probably not much over 3000, consisting largely of Jamaica negroes and of natives of mixed Spanish, Indian, and negro blood. The census of 1911 returned a population of 17,748; estimated by Isthmian Business Directory at 20,000 in 1913. According to the Canal Zone census of 1912, Cristobal had 3584 inhabitants.

COLON (Sp., Columbus). A town in the Province of Matanzas, Cuba, about 52 miles southeast of Matanzas, connected by rail with Havana, Matanzas, Cardenas, and other important cities (Map: Cuba, E 4). It is the centre of extensive sugar refineries. Pop., 1899, 7175; 1907, 7124.

COLON BACIL'LUS, or BACILLUS COLI COMMUNIS. A microörganism discovered by Escherich in 1885, and since demonstrated to be a normal inhabitant of the intestinal tract in man and some of the domestic animals. It is a short bacillus with rounded ends, is somewhat motile, has a few flagellæ, and does not form spores. The main interest which attaches to this organism at present is due to its close resemblance to the typhoid bacillus, with which it is morphologically identical, but from which it may be distinguished by its biological peculiarities. Some investigations made within the last few years tend to show that this bacillus, while of normal occurrence in the healthy intestine, may under certain conditions migrate to other organs of the body and there be associated with pathological processes.

COLONEL, kûr'nel (originally *coronel, coronell,* from Sp. *coronel,* colonel, It. *colonello,* Fr. *colonel, colonnel,* from Sp. *colonello,* column at the head of a regiment, dim. of *colonna,* column, from Lat. *columna,* column; the first *l* is changed to *r* either through dissimilation, or through popular confusion with Lat. *corona,* crown). A military title, ranking in the United States army between lieutenant colonel and brigadier general. The command appropriate to the grade is a regiment. In the United States service the army grade of colonel corresponds to that of captain in the navy. In addition to the colonels commanding regiments of the three arms, infantry, cavalry, and artillery, there are also *staff* colonels, without command, assigned to the several staff corps and departments. In the English service a colonel actively commands artillery and engineers. The infantry battalion and cavalry regiment are actually commanded by the lieutenant colonels of the regiments, the office of colonel being an honorary sinecure, carrying certain emoluments, and often bestowed upon royal and other distinguished personages. The same custom prevails in some of the continental armies. In England the custom prior to 1888 was to give the appointment of colonel to retired general officers as a reward for long service. Since that date no officer can obtain the rank except as a brevet, and then only for distinguished service or on such appointments as the colonel commanding a territorial district depôt. See RANK AND COMMAND.

COLONEL CHABERT, LE, le kô'lô'nĕl' shà'bâr'. A story by Balzac (1832), the tale of a soldier of the Grand Army, who comes back from the wars to find his wife married to another.

COLONEL JACK, HISTORY OF. A novel by Defoe (1722). Beginning life as a thief, the hero goes to Virginia, and finally becomes a respectable planter and slave owner.

COLONIA. See COLONY.

COLONIA, kô-lō'nê-â (Sp., colony). The capital of the department of the same name, Uruguay, on the Río de la Plata, nearly opposite Buenos Aires. It has a good harbor, docks, and a dry dock, and is a place of some commerce, particularly with Buenos Aires (Map: Uruguay, F 10). Pop., about 1500. Colonia was founded by the Portuguese about 1680 under the name "Colonia del Sacramento." Owing to its nearness to Buenos Aires, it gave rise to many conflicts for its possession between the Spanish and the Portuguese. In the course of one of these struggles it was almost totally destroyed in 1777. In 1806 the English, in a desperate attempt to secure the La Plata region, captured Colonia and held it for some months.

COLO'NIA AG'RIPPI'NA. The Roman name of Cologne (q.v.).

COLO'NIAL ARCHITECTURE. See ARCHITECTURE, *Colonial Architecture.*

COLONIAL CORPS. A term formerly applied specifically to colonial troops of the British Empire, but now in general use as referring to similar troops of other nations. They are usually raised for service in the colony to which they belong and not for foreign operations. An exception is the use made of the West Indian regiments of Great Britain, in the frequent punitive expeditions on the west coast of Africa. Colonial corps are officered by the regular army officers of the nation to which the colony is subject. English colonial corps are the King's African Rifles, the West African regiments (negroes), and the Hongkong Regiment. The Philippine Scouts, the Philippine Constabulary, and the Porto Rico Regiment of Infantry serve a similar purpose in the United States army. The most important attempt in recent years to build up a body of colonial troops is that made by the French Republic, which has 16 regiments of colonial infantry, three regiments of colonial artillery, and a corps of colonial cavalry. They

include the Senegal, Tonkin, and Annamite tirailleurs; the Senegal spahis; the Nalagasy tirailleurs, and the native battalions of Gaboon. Twelve of these regiments are stationed in France.

COLONIAL DAMES OF AMERICA, National Society of the. A women's patriotic society, organized in Wilmington, Del., in 1892. It is composed of State societies, of which there is one in each of the 13 original States and in the District of Columbia, together with associated societies in the non-Colonial States of California, Illinois, Michigan, Minnesota, Iowa, Ohio, Colorado, Maine, Missouri, Wisconsin, Tennessee, Louisiana, Kansas, Indiana, Alabama, Texas, Arkansas, West Virginia, Mississippi, Oregon, and Vermont. The objects of the society are the collection and preservation of manuscripts and relics of Colonial days, the restoration of historic buildings, the more general diffusion of information concerning the Colonies, and the stimulation of a spirit of true patriotism. Membership in the society is limited to women who are especially invited, and who are descended from some ancestor of worthy life who came to reside in an American colony prior to 1750. The national committee on historic research in the several States has erected memorials, pursued investigations, and issued publications such as *The Letters of William Pitt, Lord Chatham*. The membership in 1914 was over 9000.

COLONIAL DAMES OF AMERICA, Society of. A patriotic society of women in the United States, organized in New York City in 1890, incorporated in 1891, and having for its purposes the collection of manuscripts, traditions, relics, etc., of Colonial and Revolutionary times, and the commemoration of the success of the Revolution. Membership in the society is restricted to women who are directly descended from some ancestor of distinction who came to reside in an American colony before 1776. In 1914 it had chapters in New York, Baltimore, Philadelphia, Washington, Paris, San Francisco, and Shreveport, La. Consult Browning, *Some Colonial Dames of Royal Descent* (Ardmore, Pa., 1900).

COLONIAL EDUCATION. See Education, Colonial.

COLONIAL WARS, Society of. A patriotic society, organized in New York City in 1892. It consists of a general society made up of general officers and of delegates from the various State societies as follows, in the order of their institution: New York, Pennsylvania, Maryland, Massachusetts, Connecticut, District of Columbia, New Jersey, Virginia, New Hampshire, Vermont, Illinois, Missouri, Ohio, Nebraska, Minnesota, Kentucky, California, Colorado, Iowa, Georgia, Michigan, Wisconsin, Delaware, Rhode Island, Washington, Maine, and Indiana. The various State societies have, for their general object, to perpetuate the memory of Colonial events and of the men who, in military, naval, and civil positions of high trust and responsibility, by their acts of counsel assisted in the establishment, defense, and preservation of the American Colonies. With this end in view they seek to collect and preserve records relating to the Colonial period of American history and to inspire in their members the fraternal and patriotic spirit of those who made American freedom and unity possible. They admit to membership male descendants of those who assisted in the establishment, defense, and preservation of the American Colonies. The publications of the general society include general registers and historical papers and registers by the various local societies. The general society has erected a monument at Louisburg, on Cape Breton Island, and memorial tablets have been placed by the New York society on the sites of Fort Oswego and Fort Ticonderoga, and an imposing monument has been erected at Lake George. The membership in 1914 was about 4500. The New York society has placed tablets at Fort Amherst at Crown Point and also at the corner of Wall and William streets, New York, where once stood a bastion of the wall raised by the colonists for protection.

COLONIES, The Thirteen American. See United States, *History*.

COL'ONIES of Plants or Animals. See Cœnobia; Polyp.

COL'ONIZA'TION SOCIETY, The National, of America. An association organized in 1816, by Robert Finley (q.v.), "to promote a plan for colonizing (with their consent) the free people of color residing in our country, in Africa, or such other place as Congress may deem most expedient." Branches were established throughout the country, and an active propaganda was conducted in almost every State, the official agents of the society speaking frequently in public and soliciting the coöperation of the various State legislatures. The first colonists were sent out to Sherbro Island, Africa, in 1820; and two years later Liberia was founded. Bushrod Washington, Charles Carroll, James Madison, Henry Clay, and J. H. B. Latrobe served successively as presidents of the society, while such men as Bishop Hopkins, Rufus King, Dr. Channing, Benjamin Lundy, Gerrit Smith, and James G. Birney were at one time zealous members. After about 1831, however, when the movement for the abolition of slavery may be said to have first attracted general attention, the inadequacy and impracticability of the society's aims became increasingly apparent, and many of its more influential members withdrew their support. Its persistent refusal to interfere in any way with slavery, moreover, and its apparent encouragement of the racial prejudices of the whites against the blacks alienated many others who, though strongly opposing the radicalism of Garrison, believed in a policy of gradual abolition and had faith in the negro's capacity for improvement. The general idea of colonization seems to have originated with the Rev. Samuel Hopkins, of Newport, in 1770. Consult Wilson, *History of the Rise and Fall of the Slave Power in America*, vol. i (Boston, 1875), and Alexander, *A History of Colonization on the Western Coast of Africa* (Philadelphia, 1846).

The shortcomings of the society's aims, judged from an abolitionist standpoint, are admirably set forth in Garrison, *Thoughts on Colonization* (Boston, 1832); Birney, *Letter on Colonization* (New York, 1834); and Jay, *An Inquiry into the Character and Tendency of the American Colonization and Antislavery Societies* (ib., 1834).

COLON'NA. A celebrated Italian family, prominent in the history of Rome from the twelfth century to the sixteenth. They were hereditary enemies of the Orsini (q.v.), and their numerous strongholds around Rome made them at all times formidable enemies to the papacy, and on occasion its masters. To Rome the Colonnas gave a pope, 30 cardinals, and a

great number of senators and military commanders. The name of the family was probably derived from Colonna, a small settlement near the fortress of Palestrina; and Pietro of the Column, Lord of Palestrina in 1100, is commonly regarded as the ancestor of all the princely branches of Colonna, comprising at present the houses of Colonna-Paliano, Colonna di Sciarra, and Colonna-Stigliano.—EGIDIO COLONNA was born at Rome about 1247. He entered the Augustine Order and pursued the study of theology at Paris, where he was preceptor to Philip the Fair. He became general of the order in 1292 and in 1296 was made Archbishop of Bourges. He was the author of a political treatise entitled *De Regimine Principum*, dedicated to Philip the Fair and noteworthy for its systematic treatment of the art of war. He died in Avignon in 1316 and was buried at Paris. Of his works, which are marked by a good deal of dull erudition, part have remained unpublished.—LANDOLFO COLONNA was a canon of Chartres in the first half of the fourteenth century. There are attributed to him a manual of history from the creation to the pontificate of John XXII, a history of the popes, and a Latin work, *De Statu et Mutatione Romani Imperii*.—SCIARRA COLONNA was a bitter enemy of Pope Boniface VIII. War broke out between the two in 1297 over the possession of Palestrina. Sciarra was excommunicated and deprived of all his honors, and after the destruction of Palestrina by the papal forces in 1298 was compelled to flee to France. He gained the favor of Philip the Fair and, returning in the company of the French Chancellor Nogaret in 1303, resumed hostilities with the Pope, and on September 7 took the aged pontiff prisoner at Anagni. (See BONIFACE VIII.) He became Senator of Rome in 1313. He embraced the cause of Louis the Bavarian, whom he crowned Emperor in St. Peter's in 1328, but on the latter's departure was forced to flee from Rome. He died in exile in 1329.—STEFANO COLONNA, brother of Sciarra, was made Governor of Bologna in 1289. Involved in the struggle against Boniface VIII, he fled to France at about the same time as his brother. He returned after the death of Boniface and assumed a leading part in Roman politics, acting in opposition to Rienzi (q.v.), who drove him from the city in 1347. Stefano was a friend of Petrarch, who speaks of him in the *Trionfo della fama* and in his sonnets.—GIOVANNI COLONNA led an insurrection against Boniface IX in 1404 and after the election of Innocent VII joined forces with Ladislaus of Naples, driving Pope John XXIII from the city in 1413. He was killed in 1417.—OTTONE, or ODDONE, COLONNA was Pope from 1417 to 1431. (See MARTIN V.)—FABRIZIO COLONNA joined Charles VIII of France in the invasion of Naples in 1494, but soon went over to the enemy and was made Grand Constable of Naples. He defended Capua against the forces of Louis XII and took part in the battle of the Garigliano (1503). In the Holy League against France he was commander of the papal forces and, with his Spanish allies, was defeated by Gaston de Foix at Ravenna in 1512. He died in 1520. His military talents are lauded by Machiavelli in his *Arte della guerra* and by Ariosto in the *Orlando*. His daughter was Vittoria Colonna. (See COLONNA, VITTORIA.)—POMPEO COLONNA, one of the ablest generals of his time, fought under Gonsalvo de Cordova against the French. In 1513 he defeated the Venetian General Alviano in the neighborhood of Vicenza. He took Milan from the French in 1521, and in the following year gained the victory of La Bicocca over Marshal Lautrec and captured Genoa. In 1523 he held Milan against the French, but was struck down by disease and died of fast living towards the end of the year.—Another POMPEO fought in the wars of the great Cordova, distinguishing himself at Cerignola (1502) and the Garigliano (1503). He entered the Church after the death of Alexander VI and in 1517 was made Cardinal. He took an especially active part in political affairs during the pontificate of Clement VII, whose enemy he was. He was made Viceroy of Naples in 1530 and died suddenly June 23, 1532.—ASCANIO COLONNA, the son of Fabrizio, shared the family hatred for Clement VII. With the support of the Spaniards he stormed Rome, Sept. 20, 1526, and sacked St. Peter's and the Vatican. Entering the service of Charles V he was made Grand Constable of Naples, but towards the end of his life fell into disgrace. He died in prison in 1557.—MARC ANTONIO COLONNA was exiled from Rome by Pius IV and entered the military service of Spain, whose forces he successfully commanded against the Papal States in 1556. He was thereupon recalled and commanded the papal galleys in the battle of Lepanto, Oct. 7, 1571. He was made Viceroy of Sicily and died in 1584.—FABIO COLONNA, born at Naples in 1567, was a botanist of some eminence. He was the author of *Storia naturale del Messico*, a work based on that of Hernandez. He died in 1651. Consult: Cirocco, *Vite de alcuni cardinali de casa Colonna* (Foligno, 1635); Agostino, *Storia de casa Colonna* (ib., 1608); Gregorovius, *The History of the City of Rome in the Middle Ages* (London, 1895–1900); Mattioli, *Studio critico sopra Egidio Romano Colonna* (Roma, 1896).

COLONNA, ALEXANDRE, F. J. See WALEWSKI.

COLONNA, CAPE. See CAPE COLONNA.

COLONNA, GIOVANNI PAOLO (1637–95). An eminent Italian composer. He was a pupil, in Rome, of Carissimi, Benevoli, and Abbatini, became chapelmaster of San Petronio in Bologna, and was repeatedly president of the Accademia Filarmonica there. One of the most distinguished Church composers of the seventeenth century, he is remembered as the head of the Bolognese school, which produced many famous musicians. His best works for the Church, including masses, psalms, litanies, motets, etc., for from 3 to 8 voices, were published in 12 collections (1681–94). He also produced 11 oratorios and 3 operas. Many other works are preserved in manuscript.

COLONNA, VITTORIA (1492–1547). An Italian poet. She was the daughter of Fabrizio Colonna, the Grand Constable of Naples, and was born in Castello di Marino near Rome. Her youth was passed among the greatest literary spirits of Italy, and from them she gathered a love of learning and in that atmosphere composed her first poems. At 17 she married Francesco Ferrante d'Avalos, Marquis of Pescara, to whom she had been betrothed since childhood. This marriage had no issue, to the bitter disappointment of them both, and for Vittoria Colonna the sorrow was deepened by the gradual estrangement of her husband. Living apart from him at Naples and Ischia, she wrote her earlier poems in an exquisite vein of tender melancholy

at his absence, clinging later, as Ferrante rose to fame in the service of Charles V, to his glory as her principal consolation. After his death in 1525 with the laurels of Pavia on his brow, her sonnets assume a high flight of religious exaltation, expressed as were the earlier ones in Petrarchistic form. Of her many distinguished friendships that with Michelangelo is the most celebrated. Their "Platonic" relationship was at its height about this time, and left the sonnets of Michelangelo as its enduring monument. Vittoria Colonna at Naples was in close touch with the group of reformers about Valdés, and she undoubtedly shared the religious views of Reginald Pole, Contarini, and Bernardino Ochino. Her personality, one of the most beautiful of her age, is developed in the biography of Reumont (Turin, 1893), and in her *Carteggio*, ed. by Ferrero-Müller-Tordi (Turin, 1889 and 1892). Of her poems, translated by Roscoe (London, 1868) and Lawley (London, 1889), the best editions are by Mazzone (Marsala, 1897, and Giarre, 1900), and by Tordi (Pistoia, 1900). Consult also Jerrold, *Vittoria Colonna* (New York, 1906).

COLONNADE'. A row of columns supporting an entablature. When a row of columns supports arches, it is properly termed "a columnar arcade." A colonnade may be either internal or external to a building, or may, like the great curved quadruple colonnades of the plaza in front of St. Peter's at Rome, be a quite independent structure. The Greeks were the first to develop the artistic use of colonnades as exterior features; they surrounded the courts of palæstræ and market squares with them and built columnar porticoes called *stoæ* to connect important buildings or afford sheltered places for meeting and conversation. The Romans erected colonnades of colossal dimensions and great splendor, not only in Italy, but at Palmyra, Baalbec, Gerasa in north Africa, and elsewhere. A colonnade surrounding a temple is called a *peristyle;* the temple is called in that case *peripteral*, or *dipteral* if the peristyle be double. The names "tetrastyle," "hexastyle," "octastyle," "enneastyle," "decastyle," and "dodecastyle" specify colonnades of 4, 6, 8, 9, 10, and 12 columns respectively. The spacing of columns is treated of under ORDERS OF ARCHITECTURE (q.v.). See COLUMN.

COLON'NA PALACE. The palace of the Colonna family at Rome. It contains an important gallery of pictures and has a beautiful garden.

COLONNE, kô'lôn', JULES JUDE, called EDOUARD (1838–1910). A French orchestra leader and violinist, born at Bordeaux. He was a pupil, while at the Conservatory in Paris, of Sauzay, Elwart, and Ambroise Thomas. After taking the prize in harmony and the first *prix de violon* at the Conservatory, M. Colonne became first violin at the opera house, but gave that up in order to establish a series of Sunday concerts at the Odéon, known later as the Association Artistique. He gave Paris its first hearing of works by Tschaikowsky, Grieg, Wagner, and Raff, and did much for the cause of Berlioz. He was in great demand as a "guest conductor." In 1904 he visited the United States.

COLONNE DE LA GRANDE ARMÉE, de lȧ grän dȧr'mȧ'. A Doric column near Boulogne, France, commemorating Napoleon's project of invading England and founding a republic there. It is 172 feet in height and surmounted by a bronze statue of Napoleon. It was begun in 1804, but was not finished until 1841.

COL'ONNETTE' (Fr., dim. of *colonne*, column). In architecture, a small column used more for decorative than constructive purposes. It is seldom found in ancient monuments, but is a characteristic feature of the Middle Ages. The façades and apses of Tuscan churches (Pisa, Lucca), and the interior galleries of French Gothic cathedrals, show how rich an effect can be obtained by long lines of such colonettes, connected by arches and either free standing or placed against a wall. Colonnettes also occur in early Renaissance architecture, especially in minor works (pulpits, tombs, etc.) and in the Francis I style in France.

COL'ONSAY. One of the inner Hebrides, or Western Isles of Scotland, off the southwest mainland of Argyllshire, in the Firth of Lorne, between the isles of Islay and Mull, with the small isle of Oronsay, of the southern end, separated by a narrow sound, dry at low water (Map: Scotland, B 3). Colonsay and Oronsay are together 12 miles long from northeast to southwest, and 1 to 3 miles broad. The surface is irregular and composed of mica slate. Half the surface is cultivated. Next to Iona, Colonsay contains the most extensive remains of religious edifices in the Western Isles. On Oronsay stands a large stone cross and the ruins of a monastery founded in the fourteenth century. Potatoes and barley are the chief products, cattle also being raised. Pop., 1901, 301; 1911, 267.

COL'ONY (Lat. *colonia*, from *colonus*, a husbandman, colonist, from *colere*, to till). In its proper sense "colony" denotes a body of immigrants living in a foreign land under the laws and protection of the mother country; but the term has been used loosely to describe all classes of distant territories dependent in any form on a ruling power, from mere military posts like Gibraltar or Port Arthur to practically autonomous states like Canada or Australia. The Greeks were preëminently a colonizing people. They established communities in Asia Minor, in Thrace and the Crimea, on the coast of Africa, in Italy and Sicily, and in Gaul. Marseilles was a Greek town, founded by the inhabitants of Phocæa about six centuries before the Christian era. The first great colonization movement of the Greeks followed as a consequence of the so-called Dorian migration, when the conquered peoples were driven from their lands and compelled to find new homes. The second movement, which took place in the period between the eighth and the sixth centuries B.C., was due to political disturbances at home, the necessity of drawing off the surplus of population, and military and commercial interests. When it had been determined to send out a colony, the oracle was consulted, and a leader, called *oikist, οἰκιστής*, was duly appointed; fire was taken from the sacred fire that burned in the Prytaneum, and the new society, though politically independent, patterned itself after the mother city. The relation between the two communities was one of mutual affection only; but, if the new colony undertook itself to found a colony, it went, through custom, for its *oikist* to the mother city. Differing from the colony as thus described was the *cleruchy* (*κληρουχία*, allotment or apportion-

ment, from κλῆρος, lot, and ἔχειν, have), the members of which remained in close connection with the mother city and did not form an independent community. The Athenian cleruchies, the only ones of which we have any detailed knowledge, possessed a certain measure of autonomy, but only in internal affairs.

It was one of the triumphs of the organizing genius of the Romans to develop the colony to a more perfect form. It was a principle of Roman policy that not only every conquered territory, but every district where Roman citizens settled, should be an integral part of the Empire. The *colonia* was one of the municipal institutions of the Empire, having its own governing corporation dependent on Rome. There were various grades of colonies—some where there was the high privilege of Roman citizenship, and others where the citizenship was of a humbler grade. Corresponding with the consuls in Rome, there were municipal officers in the colonies (*duumviri, quatuorviri*), in whom were preserved, after the Empire was formed, the old republican institutions. The Romans appointed men of very high rank to the government of their provinces or colonies—men who had held such offices as the consulship or prætorship at home. It was a feature of the Roman system to limit their period of government, lest they should become independent of the Empire and establish separate states.

After the fall of Rome centuries passed before colonization recommenced; for the various tribes who broke into the Empire were not connected with any parent state, and the Normans who spread themselves over Europe at a later period were utterly unconnected, in the countries where they settled, with the government of the northern states whence they migrated. When Venice and Genoa were at the height of their power, they sought to advance their commercial interests by the establishment of colonies in the islands of the Mediterranean and on the shores of the Hellespont and the Black Sea. At the close of the Middle Ages the Portuguese and Spaniards became the great colonizing nations of Europe. Portugal was first in the field, establishing settlements along the western coast of Africa in the fifteenth century. After the rounding of the Cape of Good Hope by Bartholomeu Dias in 1488, which was followed 10 years later by the voyage of Vasco da Gama, she extended her settlements along the eastern coast and into India, finally penetrating to the islands of the Pacific. The Emperor Charles V, who ruled Spain when at the height of her power, aimed not only at the restoration of the Roman Empire in Europe, but at the creation of a new empire in America. Neither Spain nor Portugal followed the policy of developing the agricultural resources of the regions which they occupied, but merely used the colonies as a basis of profitable trade with the home country and as an asylum for high-salaried officials. Portugal established mere trading factories. The Spanish colonies were chiefly concerned with mining. They were governed by an official hierarchy, under the general direction of an executive department in Spain. The other governments of Europe—Great Britain, France, Holland, and the minor states—subsequently colonized in America, the East Indies, and Africa.

The earlier British colonies arose in the reverse order to those of Spain—the colonists went first, the dignitaries followed. This was especially true of the New England Colonies. Before 1630 the British race had gained a firm foothold in America. The settlers were organized as privileged companies with royal letters patent, which in practice made them virtually independent of the government at home; and as they were, for the most part, dissenters seeking a place of refuge from what they considered the grievances of the Established church and the government, they took care not to convey the grievance with them. The Northern colonists, indeed, acted as if they were a sort of private corporation. The policy of Great Britain towards her American Colonies was the result of the accepted economic philosophy of the times (see POLITICAL ECONOMY), according to which it was thought that the trade with colonies must be strictly confined to the home country. The idea was that the colonies should supply raw materials to the mother country, and in return should purchase from the latter its manufactured products. Shipping was to be in the hands of the home country. This policy was no more characteristic of England than of other European states, and the reason why it encountered such vigorous opposition in the Anglo-American Colonies was that the latter were settled by men who deliberately planned to establish homes in the New World, whereas those who made up the colonies of Spain, Portugal, or France were seeking wealth and prestige with which to reestablish their position in Europe. But no matter from what country these earlier colonists came, they did accomplish one fundamental thing: they made possible the accumulation of a sufficient supply of capital to encourage and to stimulate the invention of new machinery which, beginning in the eighteenth century, completely revolutionized society in the nineteenth. See INDUSTRIAL REVOLUTION.

During the eighteenth century Great Britain rose to a foremost position among colonial powers, and in the nineteenth century she firmly established her primacy. Rich compensation for the loss of the Thirteen Colonies—a loss which for a time seemed to threaten the dissolution of her empire—was found in the vast realm built up in India and in the flourishing colonies of Canada and Australia. In Africa, which became the principal scene of colonial activity for the European Powers in the last quarter of the nineteenth century, Great Britain holds possession of Cape Colony and the former Boer republics, and of immense tracts of territory in Central and eastern Africa. Coupled with her predominance in Egypt, this would seem to assure to England a splendid colonial development in the Dark Continent. Spain's colonial empire attained its fullest development in the seventeenth century, declined in the eighteenth, and disappeared in the nineteenth. The Treaty of Paris, in 1763, deprived France of her possessions in America and put a quietus on French colonization, Algeria excepted, for more than 100 years, until the statesmen of the Third Republic initiated a new policy of expansion in Africa and the Far East. The Dutch establishments in the East were founded in great part upon the ruins of the colonial power of Portugal. At the time of the French Revolutionary wars Holland was shorn of some of her possessions (Ceylon, Cape Colony), which went to increase the colonial domain of Britain. The annals of Dutch dominion in the East Indies have until recent times been the history of a

nation seeking to enrich itself at the expense of downtrodden peoples. With the loss of Brazil in 1822, the importance of Portugal as a world power departed. By its victory over Spain in 1898 the United States took its place among the colonial powers of the world; and through the solution of the problems presented by the necessity of reconciling the element of autocracy inherent in the administration of foreign possessions with the republican theory of American institutions, the term "colony," already loose in meaning, has attained a still broader application. See the articles on the various countries for detailed accounts of their colonies.

The problems of modern colonization are manifold. Among them are the meaning and significance of imperialism; the subjugation of alien races; the fight to capture world markets; the possibility of the tropics as a permanent home for settlers from the more temperate zones, and a dozen others. The literature upon colonization is enormous and is ever widening in scope and scientific value, from Adam Smith's *Wealth of Nations* (1776) down to the publisher's latest announcement. Consult: Brougham, *An Inquiry into the Colonial Policy of the European Powers* (Edinburgh, 1803); Wakefield, *A View of the Art of Colonization* (1849); Heeren, *A Manual of the History of the Political System of Europe* (London, 1857); Cairnes, *Colonization and Colonial Government* (ib., 1873); Roscher, *Kolonien, Kolonialpolitik und Auswanderung* (Leipzig, 1885); Norman, *The Peoples and Politics of the Far East* (London, 1895); Worsfold, *South Africa: A Study in Colonial Administration and Development* (ib., 1895); Dubois, *Systèmes coloniaux et peuples colonisateurs* (Paris, 1895); Englehardt, *Les protectorats anciens et modernes* (ib., 1896); Kidd, *The Control of the Tropics* (London, 1898); Reinsch, *World Politics* (New York, 1900), and *Colonial Government* (ib., 1902); Giddings, *Democracy and Empire* (ib., 1900); Dilke, *The British Empire* (London, 1899); Egerton, *A Short History of British Colonial Policy* (ib., 1897); Reinsch, *Colonial Administration* (New York, 1905); Zimmerman, *Colonialpolitik* (Leipzig, 1905); Schaefer, *Kolonialgeschicte* (ib., 1910); Adam, *L'Impérialisme et la morale des peuples* (Paris, 1908); Alston, *The White Man's Work in Asia and Africa* (London, 1907); Leroy-Beaulieu, *De la colonisation chez les peuples modernes* (Paris, 1908); Flammarion, *Domination et colonisation* (ib., 1910).

COL'OPHON (Lat., from Gk. Κολοφών, *Kolophōn*). An ancient Greek city of Ionia in Asia Minor. It was situated on the river Hales, about 15 miles north of Ephesus, was the native city of Mimnermus and claimed to be the birthplace of Homer. The expression, "to put the Colophon," meaning "to give the finishing stroke," is explaned by Strabo as arising from the belief that the cavalry of Colophon was so excellent that it always decided the contest. Hence comes the term *Colophon*, used of a device at the end of a book, or a note, especially one giving the name of the printer, date of publication, etc. The name of the town may, however, come rather from Gk. κολοφών, *kolophon*, 'summit'; in the expression "to put the Colophon," the word κολοφών may easily have passed from the sense of "summit" to that of "end." Several other Greek words meaning "peak," or "tip," are used in phrases of similar meaning. Cf. the history of the word *acme*.

COL'OQUIN'TIDA. See Colocynth.

COL'OR (Lat., connected with Lat. *celare*, Gk. καλύπτειν, *kalyptein*, Ger. *hehlen*, to hide, Ir. *celim*, I conceal, Skt. *śarana*, refuge). The color of an object in nature depends upon several conditions: the character of the light which illuminates it, the phenomena which take place in the body itself, the individual peculiarities of the eye which views the body. It has been shown by Sir Isaac Newton that ordinary white light may be regarded as a mixture of many colors; i.e., it may be analyzed into parts, each part producing a different color sensation. In scientific language, the sensation white, as perceived by looking at any ordinary "white" object, is due to the incidence upon the eye of trains of ether waves of different wave numbers, varying continuously between certain limits; while, if a train of waves of a definite wave number enters the eye, the sensation of color (if any) will be of a definite hue. Thus we speak of yellow light, of red light, etc., meaning those ether waves which produce these sensations of yellow or red in a normal eye. When the ether waves fall upon an object, some of the energy goes into reflected waves *at the surface*, the rest goes into the entering waves; there will in general be absorption in the interior; but if the body is transparent there will be transmitted waves, and also, in general, waves reflected and scattered by little particles in the interior of the body. The color of a green leaf is due to the fact that when viewed in ordinary daylight, out of all the waves which *enter* the leaf, only those which combine to produce the sensation green are transmitted, the others being absorbed by the coloring matter of the leaf; thus, those waves which are scattered by the minute interior parts traverse a layer of this coloring matter, and only green light emerges from all sides. The light which in this case is reflected at the surface is simply diffuse white light. An object whose color is due, as here, to what is called "body absorption," appears of the same color when viewed by reflected light or by transmitted; i.e., if we look *through* it at the source of light, or look at it from the same side as is the source. The colors of almost all natural objects are due to this body absorption.

The colors of metals, however, and some aniline dyes, are due to what is called "surface absorption." When white light is incident upon a piece of gold, yellow light is reflected *by the surface*, thus giving the yellow color. If, however, the gold is hammered out exceedingly thin, it will be found to transmit greenish-blue light, so that in the case of surface color the colors by reflection and transmission are different.

The energy of the waves which are absorbed in bodies generally goes to producing heat effects; but in some cases it is spent in producing other ether waves, thus giving rise to other colors. These bodies are called "fluorescent." (See Fluorescence.) In these cases, then, the color as seen by transmission and by looking at the bodies sidewise will be different.

The color of the blue sky, of fine smoke, and of water in many lakes is due to the scattering of light by extremely small particles—generally minute solid particles; for the short waves—i.e., blue light—are reflected by minute particles, while the other waves simply pass

around them. In all these cases it is evident that if the incident light is altered, so will be the color perceived. A green leaf in a yellow light would appear black. For an excellent treatise on color, consult Rood, *Modern Chromatics* (New York, 1879); also, Bradley, *Elementary Color* (Springfield, Mass., 1895); Jorgensen, *The Mastery of Color*, 2 vols., with 22 colored plates, showing about 1000 colors (Milwaukee, Wis., 1906); and Ridgway, *Color Standards and Color Nomenclature*, with 53 colored plates and 1115 named colors (Washington, D. C., 1912). See LIGHT; VISUAL SENSATION.

COLOR. In art, either the pigment employed to produce a certain effect to the eye, or the effect thus produced, i.e., the tint of a picture. In the former sense it is treated of in this work under PIGMENTS and the names of the principal colors. In the latter sense it may be defined as the general effect of all hues entering into the composition of the picture. It is the most important technical requisite of painting, and quite essential to a production of the first rank. The sensation of color is produced by waves of light setting into vibration fibres of the optic nerve, and the length of these light waves is the cause of the different hues. For example, when the light wave is $\frac{1}{39000}$ of an inch long, red is the color produced, and as the waves decrease in force, we see yellow, green, blue, and so on through the spectrum. According to the theory of Chevreul, now generally accepted, white light is the union of all colors, and its decomposition by an object reveals the color separated from the rest. Thus, a rose absorbs all colors but red, which it reflects; while a white substance, rejecting all colors, is therefore colorless. Correctly speaking, there are but six colors—three primary (red, blue, and yellow), and three secondary (orange, violet, and green). Orange is composed of purple and yellow, violet of red and blue, green of yellow and blue. All other colors are compounds of these.

Complementary Colors are those which, combined with another color or colors, make up the three primary colors constituting white light. If the given color be primitive, its complement is composed of the other two primitive colors. For example, the complementary color of blue is orange, i.e., red and yellow. If the given color be a secondary, its complementary is the remaining primitive color—as, e.g., the complementary color of green (blue and yellow) is red. In painting brilliancy of coloring may be obtained by placing complementary colors side by side, because each lends to the other a favorable halo, while the juxtaposition of noncomplementary colors has the opposite effect of dullness. This method of heightening and softening colors was used with great effect by Delacroix and is to-day much practiced by French and Spanish painters.

It is also usual in the studios to divide colors into warm tones and cool, according as they approach or depart from the colors of sunlight. Reds, oranges, and yellows are regarded as warm; blues, greens, and violets as cool. In painting it has long been customary to relieve warm colors by placing them near cool. This is especially marked in Correggio's pictures, which have a central point of warm color with the surroundings cool. The Florentines reversed this process, while the Venetians intermixed warm and cool tones, and Rubens placed them side by side.

Contrast of Color is either simple or compound. Each of the primary colors forms a contrast to the other two. Thus, blue forms a simple contrast to red and yellow. But if red and yellow were mixed together, the complementary color to blue would be produced, viz., orange, which is the most powerful contrast to blue. Contrast was the earliest and simplest way of obtaining color effects. It was almost universal among the Italians of the Renaissance, as witness the reds and blues in the garments of the Madonna and the saints. In modern times it has been much used, but not with the same success, by the Pre-Raphaelites in England and the followers of Ingrès in France.

Harmony of Color is usually attained by giving to the painting a prevailing color or tone, to which all the others are subordinated. It is based rather upon accord than upon contrast. For in nature there are few sudden contrasts of color, but rather gradual transitions and delicate gradations. Harmony endeavors to preserve the same tones in a painting as exist in nature. It discriminates between the same color seen in sunlight and in shadow, near or at a distance; or, in other words, between the values of colors. No matter how different the colors of the pictures, they must all accord with the dominant color tone.

The mastery of color is the most difficult achievement of painting, and it has been truly said that the colorist, like the poet, is born and not made. Concerning the Greeks, it is impossible to make statements with surety, since all their great paintings have perished. The Oriental peoples have always excelled in color, especially in their textile fabrics and ceramics. In painting, also, the Chinese and Japanese have attained remarkable and subtle harmonies. All the great schools of painting have attained excellence in color. Among the Italians the painters of Venice excelled, and in the works of Giorgione, Titian, and others attained an unsurpassed excellence. Of the great schools of the seventeenth century, which likewise excelled in color, the Flemish (Rubens) excelled in bright but harmonious effects, the Dutch (Rembrandt) in more subdued color schemes, with subtle treatment of light and shade (q.v.), and the Spanish (Velasquez), in values (q.v.) of colors. The chief excellence of the old English masters consisted in their color, and the French painters of the rococo (Watteau, Fragonard) were excellent colorists. The beginning of the modern development of painting consisted in the romantic reaction against classic line in favor of color. (See PAINTING, *History*.) The Impressionists have discovered many new tints and raised the entire scale of color. Among the many colorists of note belonging to the American school are Whistler, Abbey, and Childe Hassam.

Bibliography. The technical qualities of painting are briefly treated in a number of manuals on the appreciation of art, enumerated under the bibliography of ART, among which see especially Van Dyck, *Art for Art's Sake* (New York, 1901). Other good manuals are Blanc, *Grammaire des arts du dessin* (Paris, 1870); Bracquemond, *Du dessin et de la couleur* (ib., 1885); Grant Allen, *The Color Sense* (London, 1892); Rood, *Color* (ib., 1904); Kiesling, *Wesen und Technik der Malerei* (Leipzig, 1908 et seq.); Berger, *Beiträge zur Entwickelungs-Geschichte*

der Maltechnik (Munich, 1909), very exhaustive; Bouvier, *Handbuch der Olmalerei* (Leipzig, 1910); Sandford, *Manual of Color* (New York, 1910); Vanderpoel, *Color Problems* (London, 1903); Solomon, *The Practice of Oil Painting* (ib., 1911); Moreau-Vanthier, *The Technique of Painting* (New York, 1912); Grunewald, *Das Kolorit in der venezianischen Malerei* (Berlin, 1912).

COLOR. In law, in a figurative sense, a semblance or appearance of something, implying that the thing to which the term is applied has not the quality or character claimed; as, *color of title* means an apparent but not valid title.

Formerly in common-law pleading in England, when the defendant, pleading by way of confession and avoidance, confessed that the plaintiff had a prima facie or apparent right, the "confession" was said to give "color," and the defendant then pleaded matter by way of avoidance, i.e., to show that the facts pleaded by the plaintiff did not in law give ground for recovery against the defendant. See CONFESSION AND AVOIDANCE.

Color of Office is the semblance or pretense of authority, by virtue of an official position, assumed or claimed by an officer when he does some act outside of his actual jurisdiction. The term includes acts done under an honest but mistaken belief of power, as well as where one knowingly exceeds his authority. All such acts are void, and an officer who is thus guilty of an abuse of power is liable for any damages which may result from it or may be removed from office by impeachment or other appropriate proceeding. See CONVERSION; DE FACTO; FALSE IMPRISONMENT.

Color of Title is that which on its face appears to be proof of ownership, but which, by reason of some defect not easily discoverable, does not in law constitute a valid title. The term is generally used to describe a deed or will purporting to vest in the claimant the title to an estate in land. A conveyance by one so claiming title gives the vendee only such rights as the vendor has, i.e., the possession of the property under whatever title the vendor had, and a right to "tack," or add, the period of possession to make up the time necessary to gain absolute title by adverse possession. In the United States one claiming title under an invalid instrument purporting to convey a definite parcel of land may in some cases make good his claim by adverse possession to the entire parcel described, even though his actual physical possession (called *pedis possessio*) covers only a part or parcel thereof. See ADVERSE POSSESSION; TITLE (to property).

COLOR, IN PLANTS. The great majority of plants show distinct coloration, especially in aërial or aquatic organs. The absence of color is an index of parasitic or saprophytic life, but it must be borne in mind that many parasites and saprophytes are highly colored. The most common coloring matter in plants is chlorophyll, which manifests itself in various shades of green. Light of some strength has been shown to be necessary for the development of chlorophyll, though recent experiments show that it may develop in various seedlings germinated in perfect darkness, and that the synthesis of carbohydrates may take place vigorously under a dense layer of cork. The presence of plastids and favorable conditions of nutrition are necessary for the proper development of chlorophyll. Yellow coloration in plants is also commonly associated with plastids, and is due to the relative abundance of xanthophyll or carotin present as compared with the true chlorophyll. The phenomenon of yellowness is most common in dying leaves and is especially well shown in autumn. However, in many young leaves, especially where the nutrition conditions are unfavorable, yellow leaves also appear. Unfavorable nutrition is probably the cause of yellowness in most cases. In dying leaves the part near the veins usually remains green longest. In young leaves the green parts are longer and much better developed internally than are the yellow or white parts.

Red or blue coloration in plants is not directly associated with plastids, but is due to pigments that are scattered through the cell sap. The coloring substances are called anthocyans—erythrophyll if red, cyanophyll if blue. Blue colors occur most commonly in flowers, while the reds occur abundantly in leaves as well as in flowers. The red coloration of leaves has been much discussed in literature and deserves further mention. While in some plants, as coleus, red colors are more or less permanent, in most cases redness is periodic. Perhaps the three most common examples of color display are: (1) in the young actively growing leaves of seedlings or perennial shoots; (2) in wintering leaves, especially of rosette plants; and (3) in dying leaves, especially in autumn leaves. All kinds of causes have been assigned to account for periodic coloration, but by far the most satisfactory is one proposed by Overton in 1899. He has shown experimentally that an excess of sugar in nutrient solutions causes an early and rich development of color, while an absence of sugar retards this development. In the summer the products of a day's photosynthesis are commonly carried off before another day begins; but in the cool autumn nights this transfer is checked, and sugars accumulated in the leaf unite with tannin substances and cause the production of the pigments. A similar explanation, plus the great flow of sap, would account for red leaves in spring. Mechanical injury, which prevents the carbohydrate transfer, also causes an excess of sugar and gives rise to red colors. Light seems to favor color development, perhaps because it favors the increased production of carbohydrates.

Much has been said as to the ecological significance of red colors. Stahl and Kny, as a result of experiments, hold that red colors increase the available supply of heat and thus prolong the leaf activities in fall and enlarge them in spring. Kerner has also held the "protective" theory of color. If red colors do have any such function—and this is by no means proved—it must probably be regarded as quite incidental. In no case can the need for protection be regarded as a cause of the development of pigment, as one might suppose from reading various treatises on the subject of color. Consult Sorby, *On Comparative Vegetable Chromatology* (London, 1873). See CHLOROPHYLL; PHOTOSYNTHESIS; LEAF.

COLORADO, kŏl'ō-rä'do (Sp., colored red), "The Centennial State." A State of the American Union, admitted in 1876, the twenty-fifth in order of admission. It lies between lat. 37° and 41° N., and approximately long. 102° and 109°

W., and is bounded on the north by Wyoming and Nebraska, on the east by Nebraska and Kansas, on the south by Oklahoma and New Mexico, on the west by Utah. Longitudinal extent, about 375 miles; latitudinal extent, about 276 miles. Land area, about 103,600 square miles; water area, about 300 square miles.

Topography. Colorado lies upon the great watershed of the continent, and is, except Wyoming, the most elevated State of the Union. Several of the most prominent ranges of the Rocky Mountain system traverse it in a northerly and southerly direction. The eastern two-fifths is a portion of the region known as the Great Plains. It varies in elevation from about 3000 feet at the eastern boundary to over 5000 feet at the western edge, where it meets the foothills. It is drained by the South Platte, Arkansas, and Republican rivers, with their tributaries. Approximately in long. 105° the plains give way to chains of foothills, quite regular and in places very abrupt in the northern part of the State, more broken to the south. Back of the foothills rise abruptly the lofty ranges of the Rockies. The easternmost mountains, entering the State from the north, are called the Medicine Bow Range, and continue south as the Front Range to Pike's Peak. The crest of the Front Range is in part a portion of the Continental Divide—the waters from the east side flowing to the Mississippi and thence to the Gulf of Mexico, and those from the west side flowing westward to the Gulf of California. Pike's Peak, at the southern end of this range, is the most famous mountain in the State, but not the highest, being twenty-third in the list of 36 named peaks which reach an altitude of over 14,000 feet. Probably a dozen or more unnamed peaks could be added to the list. Over 100 other named peaks are known to rise above 13,000 feet, and at least 200 undetermined and in many cases unnamed peaks doubtless reach that altitude.

West of Medicine Bow and Front ranges are three valleys called, respectively, North Park, Middle Park, and South Park. North Park is bounded on the west by Park Range, and is separated from Middle Park by an east-west ridge which connects Park Range with Front Range and forms part of the Continental Divide. The headwaters of the North Platte River rise on the north slope of this ridge, while the waters of the south slope flow into the Grand River, thence southwestward to the Pacific. Between Middle and South parks the Front Range meets the Saguache (or Sawatch) Range, the loftiest of them all. For miles its crest towers above the 13,000-foot level, surmounted by the well-known Holy Cross Mountain (see Plate with article Holy Cross Mountain), as well as by Princeton, Harvard, Yale, and over half a dozen others whose heights exceed 14,000 feet. To the southeast the mountains are continued in the Sangre de Cristo and Culebra ranges, which extend southward into New Mexico. West of the latter ranges lies the great San Luis valley, while west of this rise the San Juan Mountains. The remainder of the west portion of the State is an area of broken mountains, plateaus, and valleys, with a general slope to the west. Many of the mountain passes are over 11,000 feet in altitude, and some of them over 13,000 feet. The great intermountain valleys or parks above mentioned are a distinguishing feature of the scenery. There are a number of smaller mountain parks, the one best known and most frequented being Estes Park, northwest of Denver, a favorite summer resort. San Luis valley extends into New Mexico, but contains in Colorado 8000 square miles, including the most level land in the State, at an altitude of about 7500 feet. Other important valleys are the Arkansas (q.v.), Rio Grande (q.v.), White, Grand, Gunnison, and Yampa (or Bear). The North Platte and South Platte rivers unite to form the Platte of Nebraska. The source of the South Platte is about 11,000 feet above sea level, and the fall in the distance to Denver is 6000 feet. The Arkansas rises over 10,000 feet above sea level, rapidly falling to 7800 feet, passing through the Royal Gorge 3000 feet deep, and flowing southeast and east into Kansas. The Rio Grande del Norte rises on the east slopes of the San Juan Range and flows through San Luis valley into New Mexico. The largest streams on the west slope are the Green, crossing the northwest corner of the State, and its tributaries, the Yampa and White; the Grand, one of the main affluents of the Colorado, and its tributaries, the Gunnison, Dolores and San Miguel. None of these streams are navigable. No other State contains the headwaters of so large a number of rivers. In the high mountains are many hundreds of small lakes, chiefly of glacial origin. Their area in many cases has been increased by artificial additions, for the storage of water for irrigation. Large reservoirs have also been constructed for the same purpose in the lower valleys and on the plains. The lofty peaks and mountain parks are equaled in grandeur by the river cañons; those of the Arkansas, Grand, Gunnison, South Platte, Boulder, Uncompahgre, Big Thompson, and others varying in depth from 1000 to 3000 feet.

Climate and Soil. The topographic features—great differences in elevation, extensive plains, high mountain ranges, and broad valleys—result in a varied, though in general mild and salubrious, climate. The high altitude of the State premises a cool temperature. In the lower portions the days are sometimes hot, but the nights are cool and free from humidity. Mean annual temperature at Fort Collins, 46.7°, July 68.2°, December 29.7°; at Pueblo, 51.1°, July 74°, December 33.7°; at Denver, 49.4°, July 71.7°, December 32°; Long's Peak Inn, 37.7°, July 55°, December 25.1°. The mean annual precipitation varies from 7 to 40 inches, according to location. In several small areas it falls below 10 inches; in about one-third of the State it is from 10 to 15 inches; in about one-third from 15 to 20 inches; in the higher mountain ranges it is from 20 to 25 inches; and in a few of the highest mountains from 25 to 40 inches. The dry climate and pure, bracing atmosphere of Colorado are considered beneficial to asthmatic and pulmonary sufferers, and the charming parks are becoming great natural sanitariums. Thousands of persons flock to the State annually to regain their health, and other thousands for recreation and the enjoyment of the scenery, hunting, and fishing. The various mineral springs are also adjuncts to the remedial nature of the climate. The hot sulphur, iron, and soda springs of Middle Park, Steamboat Springs,

Wagon Wheel Gap, Manitou, Cañon City, Glenwood Springs, and Idaho Springs are famous.

The soil along the river bottoms is largely alluvial, with much light loam in the eastern part of the State. In some places siliceous and micaceous substances abound, while here and there clay formations crop out. The forests cover about 10,500,000 acres of land, restricted mainly to the mountains.

For the flora and fauna, see the paragraphs under ROCKY MOUNTAINS.

Geology. The geological structure of Colorado is extremely varied. On the eastern plains Cretaceous and Tertiary strata are exposed in nearly horizontal position and in great thickness. On the eastern flank of the mountains these formations give way to Cambrian, Ordovician, Carboniferous, Jurassic, and probably some Permian and Triassic. The lowest foothills are in most cases Cretaceous. These formations are upturned and in some places much folded. The axis of the mountain system is formed by granites and other igneous rocks, more or less metamorphosed, of Archæan age, with a great variety of later volcanic rocks. On the western edge of the system Paleozoic strata again appear, including Devonian, and are overlaid farther west by Cretaceous, Jura-Trias, and Tertiary beds. In North and Middle parks the formations are mostly Cretaceous and Tertiary, surrounded by Archæan rocks and volcanic intrusions. The Carboniferous rocks of the State, unlike those along the Appalachian Mountains, inclose no coal seams. Coal occurs, however, in great abundance in later formations—mostly Cretaceous, that in North Park, Tertiary. The great upheavals, accompanied by volcanic activity, along the Rocky Mountains have favored the formation of ore deposits, some of which are of great economic importance. Cripple Creek, Leadville, Boulder, Ouray, Aspen, Rosita, Silverton, Gilpin, Lake City, and Gunnison are important centres of gold, silver, and lead mining. Copper, zinc, manganese, and iron ores also occur in extensive deposits. During Pleistocene time the mountain valleys in all the higher ranges were occupied by glaciers for a distance averaging about 10 miles on each side of the crests. Several small glaciers are still active, the one most visited and best known to geologists being the Arapahoe, west of Boulder.

Mining. Colorado is best known as a mining State. Although it does not lead in any important mineral product, it closely approaches California in the production of gold, and in former years its yield was larger. In 1912 it ranked eleventh among the mineral-producing States in the total value of its output. The total value of mineral products in that year was $58,167,399. The chief mineral is gold, which in 1912 was valued at $18,588,562 and in 1913 at $18,395,000. Gold production has fallen off somewhat because of the exhaustion of certain rich deposits. In 1906 the production exceeded $30,000,000, and in 1908–09 the State stood first in the production of gold. California regained first place in 1910. The most important gold-producing district is Cripple Creek in Telluride County. In this district in 1912 gold was produced to the value of $11,008,362, or over 60 per cent of the production from all the deep gold mines of the State. There was an increased production of about $175,000 in 1913. Other important gold-producing counties are San Miguel, Ouray, San Juan, Gilpin, and Clear Creek. Of the gold mined 95 per cent is from siliceous ores. Many famous camps which have been large producers have become practically exhausted. These include Silverton and Ouray. At the latter place is the Camp Bird Mine, which was for a long time one of the richest and most steadily producing mines in the United States.

Coal is the mineral product of second importance. There were produced, in 1912, 10,977,824 short tons, valued at $16,345,336, compared with 10,157,373 short tons, valued at $14,747,764, in 1911. The production in 1913 was a decrease of about 1,500,000 tons over 1912. The coal fields of the State are divided by the major ranges of the Rocky Mountains into three general groups, designated as the Eastern, the Park, and the Western. The Eastern group, the most highly developed of the three, comprises the Denver region and the Cañon City and Trinidad fields. The Park group includes the little-known and almost undeveloped fields of the South, Middle, and North Park. The Western group is the largest in area and it contains the greatest amount of coal. All the fields of this group, with the exception of the Yampa field in the extreme north and the Durango field in the south, belong to the great Uinta basin, which extends from Gunnison Co., Colo., on the east, to Carbon and Emery counties, in the central part of Utah, on the west. The coal ranges from subbituminous in the Denver regions, through various grades of bituminous, including the high-grade coking coal of the Trinidad and Glenwood Springs fields, to true anthracite, in the Crested Butte and Yampa fields. Some of the coal beds are of enormous thickness. The total area underlain by coal was estimated at 17,130 square miles, and about 60 per cent of that entire region is believed to contain coal workable under present conditions. There is an extent of territory which embraces over 4000 square miles about which little is known, but which may contain workable coal, and nearly 3000 square miles of territory in which the coal lies under heavy cover and is not workable on that account at the present time. Colorado is the most important coal-producing State west of the Mississippi River and ranks seventh among all the States in production. In 1912 there were about 13,000 men employed in the coal mines.

Zinc is also mined extensively, and its production has increased considerably. In 1912 the recoverable zinc content of the ores mined in Colorado amounted to 66,111 tons, valued at $9,123,374. The product for 1913 decreased in value by $1,732,000 over 1912. Zinc mining ranks third in importance among the mining industries.

Colorado leads all the Western States in the manufacture of pig iron. The ore from which the iron is made, however, is obtained chiefly from New Mexico and Wyoming, and the value of the product is not included in the total mineral production of the State.

Silver ranks fourth in the value of the output, amounting in 1913 to $9,159,367, compared with $5,050,423 in 1912 and $3,884,989 in 1911. Silver production is largely from dry and siliceous gold and silver ores and from silver-lead ores, the principal producing coun-

ties being Lake, in which is the famous Leadville district, San Miguel, Mineral, Ouray, Pitkin, Clear Creek, San Juan, and Gilpin. The same counties furnish the larger part of the lead production, which in 1913 was over 40,000 tons, an increase in value of $377,000 over 1912. In 1912, 37,621 short tons were produced, valued at $3,385,902, compared with 34,884 short tons, of $3,135,568 value, in 1911. This quantity is that of recoverable lead content of the ore mined, not the quantity and value of the lead smelted. Other mineral industries which yield products exceeding $1,000,000 in value are stone quarrying and clay and copper mining. The value of the stone production, most of which was marble, was $1,420,607 in 1912. The clay products, exclusive of the raw clay sold, were valued at $1,437,394. Copper is produced in considerable quantities. The main output of the mineral is derived from the treatment of mixed ores, of which copper is of minor importance. These include lead-silver ores and pyritic ores rich in gold and silver. The quantity of copper thus derived in 1913 was 7,634,000 pounds. In 1912 it was 7,007,303 pounds, valued at $1,172,705, compared with 8,024,488 pounds, valued at $1,003,061, in 1911.

As a result of the interest taken in the manufacture of radium, popular attention has been directed to the production of uranium-bearing ores, from which the radium is obtained. There are two distinct varieties of these ores in Colorado—the carnotite impregnations in sandstone of the southwestern part of the State, in the Paradox valley, and elsewhere, and the pitchblende of Gilpin County. From these mines are obtained practically all the radium-bearing minerals in the United States. The State ranks first in the production of tungsten ores. These in 1912 were valued at $297,533. Other minerals produced are cement, feldspar, fuller's earth, gem materials, gypsum, iron ore, lime, natural gas, petroleum, sand and gravel, and sulphuric acid. The production of petroleum in 1912 was 206,052 barrels.

The figures of the thirteenth census, which are for the calendar year 1909, show that in that year there were in Colorado 672 mine operators with 1575 mines and quarries. The capital invested in the mining industry was $144,639,558. There were 26,743 persons engaged in these industries, of whom 24,769 were wage earners. The value of the products of the mines in that year was $45,680,135. The results of the census show that Colorado and Indiana, of the important mining States, show a decrease in mining activity. This decline in Colorado is shown not only in the value of products, but also in the amount expended for salaries and wages, which decreased 7.2 per cent since 1904.

Agriculture. The agricultural development of Colorado has had a comparatively recent beginning. Although a larger part of its area is of a character which makes the growing of crops impossible, large portions are admirably adapted for cultivation. The eastern two-fifths, which lies within the Great Plains section of the United States, is largely utilized for grazing purposes, but dry farming has been successful and irrigated portions yield large crops. Within the central mountain mass there are numerous parks and smaller valleys, the floors of which are formed from alluvial or lacustrine deposits. Wherever water is available and the altitude is not too great, these are irrigated for the production of vegetables, grain, grass, and fruit. There is little agricultural activity in the high mountainous regions except in the San Luis valley in the south-central part of the State. To the west of the divide the streams supply large volumes of water for irrigation in the valleys. The rainfall is at times considerable. To the east of the divide on the plains the rainfall is heavier, and here some crops are grown without irrigation. Wherever water is available irrigation has been introduced. The largest irrigated areas in the State are in the valleys of the South Platte and Arkansas rivers, extending from the mountains to the eastern boundary of the State.

The growth of agriculture is indicated by the following figures. The number of all farms in 1910 was 46,170, compared with 24,700 in 1900, or an increase of 86.9 per cent in the decade. Out of an approximate land area of 66,341,120 acres, the land in farms in 1910 amounted to 13,532,113 acres, compared with 9,474,588 acres in 1900, or an increase of 42.8 per cent. The improved land in farms in 1910 was 4,302,101 acres, while in 1900 it was 2,273,968 acres, or an increase of 89.2 per cent in the decade. The average number of acres per farm decreased from 383.6 in 1900 to 293.1 in 1910. The value of farm property from 1900 to 1910 shows a remarkable increase. In the latter year it was $491,471,806, while in 1900 it was $161,045,141—an increase of 205.2 per cent. The average value of all property per farm in 1910 was $10,645, and in 1900 $6520. The average value of land per acre increased from $9.54 in 1900 to $26.81 in 1910. If an earlier period is taken, the increase in the development of agriculture is even more striking. During the period from 1870 to 1910 the number of farms increased on an average over 1100 a year, and there were 26½ times as many farms in 1910 as in 1870.

In 1910 the total number of all farms was 46,170, of which 37,780 were operated by owners and managers, and 8390 by tenants. The farms operated by owners and managers in 1900 numbered 19,119, and those operated by tenants, 5581. It is significant that while there was an increase of 21,470 in the total number of farms during the decade, the number of farms operated by owners and managers increased by 18,661, while those operated by tenants increased only 2809. The great majority of the farms have been acquired by their owners or operators from the government or from private corporations, in the form of homesteads, Carey Act entries, desert-land entries, or irrigated farms. Most of these have been acquired at a small price or on long time and other favorable terms, making ownership possible to the man of small means. This fact doubtless accounts in the main for a smaller proportion of farms operated by tenants than is found in most of the older States. In 1910 the total number of farms owned or operated by tenants was 36,993, of which 26,822 were reported free from mortgage and 9636 were reported as mortgaged. The average amount of the mortgage debt per farm was $2508. The average equity per farm above the mortgage was $7706.

Over one-third of all the farms in the State in 1910 were between 100 and 174 acres in size. About one-fifth were from 260 to 499 acres. Of the total farm acreage of the State

in 1910, 36.1 per cent was in farms of 1000 acres and over, and 29 per cent was in farms of 175 to 499 acres, these being the most important size groups. Four-fifths of the farmers of the State in 1910 were native whites, and almost one-fifth were foreign-born whites. There were only 574 non-whites; of these 405 were Indians, 87 Japanese, 81 negroes, and 1 Chinese. Of the 8398 foreign-born white farmers in 1910, 1926 were born in Germany, 1128 in Sweden, 882 in England, 734 in Russia, and 643 in Canada.

The total value of crops in 1909, according to the thirteenth census, was $50,275,000. Of the total value, less than one-third (29 per cent) was contributed by cereal crops. About one-third was contributed by hay and forage, about one-eighth by sugar crops, and about one-eighth by potatoes and other vegetables. The remainder, representing 13.2 per cent of the total, consisted chiefly of fruits and nuts. The total value of crops in 1909 was 200.4 per cent greater than in 1899. This increase was due partly to higher prices. The table given below gives the acreage, production, and value of the chief crops in 1909 and in 1913. The figures for 1909 are from the thirteenth census, and those for 1913 are estimates from the United States Department of Agriculture.

		Acreage	Prod. bu.	Value
Corn	1913	420,000	6,300,000	$4,368,000
	1909	326,559	4,903,304	2,673,584
Wheat.....	1913	460,000	9,680,000	7,551,000
	1909	340,729	7,224,057	6,463,926
Barley.....	1913	100,000	3,250,000	1,820,000
	1909	71,411	1,889,342	1,100,753
Oats	1913	305,000	10,675,000	4,697,000
	1909	275,948	7,642,855	4,177,260
Rye	1913	20,000	340,000	204,007
	1909	15,715	198,025	123,530
Potatoes	1913	80,000	9,200,000	5,980,000
	1909	85,839	11,780,674	3,704,768
Hay.....	1913	890,000	*824,000	18,240,000
	1909	1,285,064	2,241,566	17,282,276

* Tons.

It will be noted from this table that by far the most important crops are hay and forage, which have more than three times the acreage and three times the value of wheat, the next crop in order. The production of sugar beets is one of the most important agricultural industries, and Colorado ranks first in the country. The acreage in sugar beets in 1909 was 108,082. The production was 1,231,712 tons, with a value of $6,061,162. In 1913 the acreage was 157,000 and the production 1,800,000 tons, from which 215,000 short tons of sugar were made. Certain portions of the State are particularly adapted to the growing of vegetables and fruits of various sorts. Of these the best known are the cantaloupes, or melons, which are shipped annually in hundreds of carloads from the Arkansas River region. These include the famous Rocky Ford cantaloupes. The most important vegetable produced is the potato. The statistics of its production will be found in the table above. Orchard fruits grown include apples, peaches, nectarines, pears, plums, prunes, cherries, and apricots. The total number of trees or vines bearing orchard fruits in 1910 was 2,947,920. The total value of the product was $4,651,792. The most important fruit produced is apples. Of small fruits there was an acreage in 1909 of 2829, and the crop was valued at $398,836. The most important small fruit is the strawberry. There were, in 1910, 101,332 grapevines of bearing age, and the value of the grape crop was $28,026. A small quantity of nuts was produced.

Stock Raising. The total value of the live stock on the farms of Colorado in 1910 was $68,840,485. Cattle numbered 1,127,737, with a value of $31,017,302; horses, 294,035, with a value of $27,382,926; mules, 14,739, valued at $1,798,535; swine, 129,294, valued at $1,568,158; and sheep, 1,426,214, valued at $6,856,187. The number of domestic animals in 1913 was, according to the statistics of the United States Department of Agriculture, 3,076,863. The number of fowls of all kinds in 1910 was 1,721,445, valued at $1,012,254. The wool produced on the farms in 1909 was valued at $1,172,666.

Stock raising was the original agricultural industry of the State, and for a time it had almost the whole field to itself. The introduction of mixed farming has, to a certain extent, modified the conditions under which cattle were raised in former years. There are still large areas of semiarid land which can be utilized only for grazing purposes. Upon this land are many large farms or ranches.

That cattle raising on a large scale is decreasing is shown by the fact that in 1906 there were 1,362,303 cattle being raised for market purposes, while on Jan. 1, 1914, the number was estimated at 921,000. There were also fewer sheep grown in 1914 than in 1906, the figures for the latter year being 1,677,561 and for the former (est.) 1,668,000. Sheep raising is confined chiefly to the southern counties.

Irrigation. Of the 46,170 farms in Colorado, 25,926, or 56.2 per cent, were irrigated in 1910. The acreage of these irrigated farms was 2,792,032, or 64.9 per cent of the improved land in farms. Enterprises existing in 1910 were capable of supplying 3,990,166 acres with water, and the total acreage included in irrigation projects which were completed or under way was 5,917,457. (See IRRIGATION; RECLAMATION.) On Sept. 28, 1909, the Gunnison irrigating tunnel was formally opened by President Taft. This tunnel is a part of the largest single irrigation project undertaken by the United States government up to that time. The tunnel was driven from two points, 6 miles apart—one on the Gunnison River, whence the water supply came, and the other at Montrose in the Uncompahgre valley, on the other side of the range. Through this tunnel water to irrigate from 150,000 to 175,000 acres of land is carried. The tunnel was completed for use in June, 1910, and the complete project was nearly three-fourths completed at the beginning of 1914. The government is also carrying on preliminary work on another irrigation project in the Grand valley. It is designed to irrigate about 50,000 acres by means of tunnels from the Grand River.

Forest Products. These include firewood, fencing material, logs, railroad ties, telegraph and telephone poles, material for barrels, naval stores, etc. There were, in 1902, 2181 farms in the State reporting forest products, the total value being $305,719, compared with $113,055 in 1899—an increase of 170.4 per cent. Of the value in 1909, $137,701 was reported as

that of products used or to be used on farms themselves, $153,978 as that of products sold or for sale, and $14,040 as the amount received for standing.

Manufactures. Colorado is preëminently a mining State, but the proportion which the value of its manufactures formed of the total value of the manufactures of the United States increased steadily at each census from 1869 to 1899. From 1899 to 1909, however, this proportion decreased. In the former year it was eight-tenths of 1 per cent, seven-tenths of 1 per cent in 1904, and in 1909 six-tenths of 1 per cent. During this period of 40 years the gross value of products per capita of the entire population of the State increased from $72 to $163 in 1909. Much of the manufacturing activity such as smelting, iron and steel operations, cement manufacture, and marble and stone work, is dependent upon the development of its extensive mineral resources. Furthermore, many manufacturing establishments owe their existence to the needs of the mining industry. Irrigation of the fertile valleys of the Platte and Arkansas rivers and other streams has made the beet-sugar production of Colorado greater than that of any other State. (See *Agriculture.*) The canning industry is also the outgrowth of the development of irrigation. Coal and timber as fuel for industrial consumption and timber as manufacturing material are abundant and generally accessible. The fact that Colorado is a natural grazing country is responsible for the development of such industries as slaughtering and meat packing, the manufacture of butter, cheese, and condensed milk, the rendering of grease and tallow, and wool scouring.

The table below gives the most important data in regard to manufactures in 1909 in comparison with 1904:

COMPARATIVE SUMMARY FOR 1909 AND 1904

ALL INDUSTRIES COMBINED AND SELECTED INDUSTRIES

INDUSTRY	Census	Number of establishments	PERSONS ENGAGED IN INDUSTRY		Capital	Wages	Value of products	Value added by manufacture
			Total	Wage earners (average number)	Expressed in thousands			
STATE — ALL INDUSTRIES....	1909	2,034	34,115	28,067	$162,668	$19,912	$130,044	$49,553

* Excluding statistics for one establishment, to avoid disclosure of individual operations.
† Excluding statistics for six establishments, to avoid disclosure of individual operations.
‡ Excluding statistics for two establishments, to avoid disclosure of individual operations.

From this table it will be noted that the industries with the largest value of products are those connected with slaughtering and meat packing. The value in 1909 was $9,657,000.

The wage earners employed in this industry numbered 659. The second in value of production were flour-mill and gristmill products, followed by the industries relating to printing and publishing. From 1904 to 1909, the number of manufacturing establishments increased 26.7 per cent, and the average number of wage earners 28.6 per cent, while the value of products increased 29 per cent, and the value added by manufacture 33.8 per cent.

The wage earners in the State in 1909 numbered 28,067, of whom 25,957 were male and 2110 were female. The wage earners under 16 years of age numbered 165, of whom 16 were females. The prevailing hours of labor for more than one-half of the wage earners employed ranged from 54 to 60 a week. Of the total number of wage earners, 22.7 per cent were employed in establishments where the prevailing hours of labor were less than 54 hours per week, and 22.9 per cent in establishments where the prevailing hours were more than 60 a week. There are only four cities in the State in which manufactures are important—Denver, with 12,058 wage earners and a product valued in 1909 at $51,538,547; Pueblo, with 1320 wage earners; Colorado Springs, 516; and Trinidad, 220.

Population. Colorado is the most populous of the Rocky Mountain States. The steady increase in population is shown by the figures by decades—1860, 34,277; 1870, 39,864; 1880, 194,327; 1890, 412,198; 1900, 539,700; 1910, 700,024. The increase in the decade 1900 to 1910 was 259,324, or 48 per cent. The State ranked thirty-second in population, the same relative rank which it held in 1900. The population per square mile in 1910 was 7.7, compared with 5.2 in 1900, and 4 in 1890. The urban population in 1910 was 404,840, and the rural population 394,184. Urban population showed an increase of 50.1 per cent in the decade 1900–10, and rural population an increase of 46 per cent. The estimated population on July 1, 1914, was 909,537; 1920, 939,629.

Of the total population in 1910, 475,136, or 59.5 per cent, were native whites of native parentage; 181,428, or 22.7 per cent, were native whites of foreign or mixed parentage; 126,851, or 50.9 per cent, were foreign-born whites; and 11,453, or 1.4 per cent, were negroes. The percentage of the foreign-born population is as follows: Germans, 13.5; Italians, 11.3; Russians, 10.7; Austrians, 10.3; English, 10.2; Swedes, 9.8; Canadians, 7.5; Irish, 6.9; Scottish, 3.4; Danes, 2.2; Mexicans, 2, and all others, 12.4. The Indian population in 1910 was 1482, compared with 1437 in 1900. The Chinese numbered 373 in 1910, compared with 559 in 1900, and the Japanese, 2300 in 1910, compared with 48 in 1900. The total number of males of voting age in 1910 was 271,648, representing 34 per cent of the population. The principal cities of the State with their populations are as follows: Denver, 1910, 213,381, 1900, 133,859; Colorado Springs, 1910, 29,078, 1900, 21,085; Leadville, 1910, 7508; 1900, 12,455; Cripple Creek, 1910, 6206, 1900, 10,147. The decrease in the population of Leadville and Cripple Creek is due to the exhaustion of mines which were chiefly responsible for the settlement and growth of those cities. There were, in 1910, 27 cities having a population of more than 2500.

Transportation. Colorado has a greater railway mileage than any other of the Rocky Mountain States. On Jan. 1, 1913, there were 5871 miles of track. Of this, 4380 was standard gauge, and 1491 narrow gauge. The railroads in the State having the longest mileage are as follows: Atchison, Topeka, and Santa Fe, 512; Chicago, Burlington, and Quincy, 394; Chicago, Rock Island, and Pacific, 165; Colorado Midland, 261; Colorado and Southern, 397; Denver and Rio Grande, 970; Rio Grande Southern, 179; and the Union Pacific, 590. The electric roads include the Denver and Intermountain Railroad Company, 34 miles; the Denver and Interurban, 54 miles; the Grand Junction and Grand River Valley, 21 miles; and the Trinidad Electric Transmission Railway and Gas Company, 19 miles. The Legislature of 1909 created a State Railroad Commission, which has general charge of the regulation of railway rates. It is composed of three commissioners appointed by the Governor. There are no navigable rivers in the State.

Education. Colorado has an excellent educational system, and it is efficiently administered by the State board with the State Superintendent of Public Instruction in charge. The number of illiterates is small. The thirteenth census showed 23,780 persons, or 3.7 per cent of the population, unable to read and write. The number in 1900 was 17,779; the percentage, 4.2. The percentage of illiteracy in urban population in 1910 was 2.4 and in rural population 5.2. Among the native whites the percentage in 1910 was only 1.6. According to the census figures the total school population in 1910, ages 6 to 20 inclusive, was 215,940. Of these 147,626 were in attendance in schools. Of the number attending schools, 97,182 were of native white parentage, 42,895 were of foreign or mixed parentage, 12,070 were foreign-born whites, and 1548 were negroes. According to the school census taken in 1913 the total school population in that year between the ages of 6 and 21 was 177,428. The enrollment in the public schools in the same year was 130,948. The average daily attendance was 120,326. There were enrolled in high schools 16,377, and in graded schools below high schools 112,582. The enrollment in rural schools was 48,469. The total number of teachers in graded schools was 3683, of whom 3079 were females and 604 males. In the rural schools were 2042 teachers, of whom 1744 were female and 298 male. The average monthly salary of male teachers in graded schools was $102.45, and of female teachers $69.01. The average monthly salary of teachers in rural schools was $61.09, and for female teachers $56.19. The disbursements for educational purposes in 1912 included $3,836,166 for teachers' salaries, $1,232,254 for current expenses, $1,262,794 for building, sites, and improvements, and $13,252 for library purposes. The assessed valuation of school property in 1912 was $425,911,427. Increased attention has been given in recent years to the development of rural schools. Courses in agriculture have been introduced in several counties, and a department of rural schools has been established in the State Agricultural College. In addition to the common schools, the State supports a School for the Deaf and Blind at Colorado Springs, a State Industrial School for Boys at Golden, a State Home and Training School for Mental Defectives in Jefferson County. Provision is also made for the teaching of the adult blind outside of schools. The Legislature has made provision for the appoint-

ment of a State teacher of the adult blind, and such a teacher was appointed in 1911. The institutions for higher education include the State Normal School at Gunnison, the State Teachers' College of Colorado at Greeley, the University of Colorado at Boulder, Colorado College at Colorado Springs, College of the Sacred Heart and Colorado Women's College at Denver, Colorado Agricultural College at Fort Collins, State School of Mines at Golden, University of Denver at University Park, and Westminster College at Westminster. The University of Colorado, Colorado College, State Teachers' College, University of Denver, and Westminster College are coeducational.

Finances. The report of the State Treasurer for the biennial period, 1911–12, shows a balance in the treasury at the beginning of the period Dec. 31, 1910, of $3,309,320. The receipts for the period were $8,237,909, and the disbursements $7,383,035, leaving a balance on Dec. 1, 1912, of $4,164,195. The net floating and bonded indebtedness of the State on Nov. 30, 1912, was $2,890,544. The Legislature of 1911 created a State Auditing Board and a Tax Commission. It also provided for the revision of the revenue laws of 1902 and 1908.

Banks. There were in the State, on June 14, 1912, 127 national banks, with deposits subject to check amounting to $56,310,371, and savings deposits amounting to $4,051,179. There were 136 State banks with deposits subject to check amounting to $7,516,205, and savings deposits of $1,171,509. The savings banks numbered 8, with 14,955 depositors and deposits aggregating $2,816,070. In addition to these there were 25 private banks with deposits subject to check amounting to $1,852,660, and savings deposits amounting to $147,870.

Charities and Corrections. The charitable and correctional institutions under State control include the Home for Children, Soldiers' and Sailors' Home, Workshop for the Blind, State Hospital, State Home and Training School for Mental Defectives, Boys' Industrial School, Girls' Industrial School, State Penitentiary, and State Reformatory. For the maintenance of the above institutions for the biennial period ending Nov. 30, 1914, there was appropriated the sum of $882,000, and for improvements, $95,500. Largely through the efforts of Judge Ben B. Lindsey, the Legislature in 1909 passed a bill providing that delinquent children shall come under the chancery powers of the courts of record. The bill provided for a referee to be called the Master of Discipline to hear cases of delinquency and dependency when it is practicable to try the same before the chancery side of the court. The same Legislature also passed bills to supplement and strengthen existing acts punishing those charged with juvenile delinquency. Another bill, actively supported by Judge Lindsey, passed at this session created a probation court, wherein it is lawful for the judge of the court to hear evidence in relation to all matters properly put before it, to fix the amount of damage committed by the person charged with the offense, and, with the consent of the person in whose interest the proceedings were begun, to order reparation to be made by him to the person suffering such damage by the return of the property taken or payment of the damage done. The Legislature of 1911 passed a measure permitting the State Soldiers' and Sailors' Home to admit Confederate veterans. This Legislature also provided for the parole of prisoners in county jails for good conduct and work, and for the employment of prisoners in jails. Half of any prisoner's earnings by this enactment is to go to his dependent wife and children. The same Legislature also passed the child-labor laws to forbid any child under 14 being employed in a theatre, or in places of amusement where intoxicating liquors are sold, or in any other places; a child of this age must have a permit to work on a farm or an orchard. No child under 14 may be employed during school hours or before 7 A.M. or after 8 P.M., and 8 hours is the maximum for child labor. The Legislature of 1913 also enacted several important bills relating to the work of charities and corrections. These provided for the regulation of the sale of cocaine, and the registering of tuberculous persons, and forbade the publication of trial, etc., where children are involved. At the general election of 1912, through the operation of the referendum, a mother's compensation law was carried. Other measures passed by referendum at this election were those providing for a more extended civil service, and limiting the hours of work for women. In 1913 a home for the blind was established at Denver. An international white-slave association was also organized in that city.

Militia. The militia organizations of the State include two regiments of infantry of 11 companies each, one squadron of three troops of cavalry, one battalion of two batteries of field artillery, one company of engineers, one company of signal troops, and three detachments of sanitary troops. The total strength of enlisted men in 1913 was 1309, and of officers 137. The official designation is the Colorado National Guard.

Government. The constitution was adopted by a vote of the people Aug. 1, 1876. By a two-thirds vote of each House a proposed amendment may be referred to popular vote, but amendments must be voted upon separately. A proposal for a constitutional convention may also be referred to the people by a two-thirds vote of each House, and if a majority of the people approve, the next session of the Legislature must provide for such convention. It must consist of twice as many delegates as there are members of the Senate, and the constitution drawn up must be submitted to the people for ratification.

Suffrage and Elections.—Since 1893 women have had suffrage in Colorado on equal terms with men. The constitution specifies 12 months' residence as a principal requisite to voting and authorizes the Legislature to make other time requirements. At a special session of the Legislature held in 1910 a direct-primary election law was passed. This provides for nominations by direct-primary elections except for municipal officers and delegates to national assemblies or presidential electors. According to provisions of this law political parties have separate tickets, and all candidates for nominations are placed on a direct-primary ballot by petition or certificate of designation. All party direct-primary elections are to be held at the same time and place, and all voters must register before they have the privilege of voting. All direct-primary elections are conducted under the general election laws of the State as far as the provisions of these laws are applicable. The law contains provisions regulating campaign expenses. Personal expenses for candidates for United States Senator are limited to $5000, the

candidate for House of Representatives or a State office to $2500, and for any other office to $1000. Candidates are obliged to file sworn statements of expenses. Candidates for United States Senator are nominated at direct-primary elections. Candidates for State Senator or member of the State House of Representatives are given the privilege of making a declaration of their purpose to vote for candidate for United States Senator who has received the highest number of the people's vote of that office at the general election next preceding the election of the Senator of Congress, without regard to individual preference. Severe penalties are prescribed for the bribery of voters and for other election offenses. The election commission in cities having special charter providing for such commission are given all the powers of jurisdiction and perform all the duties provided by this act in respect to county clerks, city or municipal clerks, and members of county commissions or any other election officials or members subject to the general laws of the State except as otherwise specifically provided by their charters. The Legislature of 1913 passed an elaborate act regulating the registration of voters previous to election. Voters, except for school election, must register 10 days or more before the election. The Legislature of 1913 ratified the seventeenth amendment to the constitution providing for the direct election of Senators, and passed a measure permitting the Governor to make temporary appointments in case of vacancy, and prescribing the method by which elections for Senators are to be held. An amendment to the constitution carried in 1912 provided for the recall of all elective officials.

Legislative.—State elections are held on the first Tuesday in October of even years, and the Legislature meets on the first Wednesday of the following January. Senators and Representatives are elected for terms of four and two years respectively. The aggregate number of Senators and Representatives can never exceed 100. No bill can be so altered or amended on its passage through either House as to change its original purpose. Revenue bills must originate in the House of Representatives. Ordinary expenses only can be included in general appropriation bills. A member cannot vote on a bill in which he has a personal or private interest. In 1910 constitutional amendments providing for the initiative and referendum were adopted by the people. This law in its essentials is similar to that of Oregon (q.v.). It was declared invalid by the district court on Aug. 23, 1912, but was held constitutional by the State Supreme Court on September 23 of the same year.

Executive.—The executive officers are a Governor, Lieutenant Governor, Secretary, Auditor, Treasurer, Attorney-General, and Superintendent of Public Instruction, the term of each being two years. Their salaries are determined by law, and neither Treasurer nor Auditor can be his own immediate successor. A two-thirds vote of both houses overrules the veto of the Governor. The Governor may veto any item of a money appropriation bill. He may grant reprieves, commutations, and pardons, and convene the General Assembly in special session. The Lieutenant Governor, who is President of the Senate, succeeds to the governorship in case of vacancy.

Judicial.—The judicial power of the State as to matters of law and equity, except as in the constitution otherwise provided, is vested in a supreme court, district courts, county courts, justices of the peace, and such other courts as may be provided by law. There are three supreme court judges, elected for nine years; the district judges—one or more for each judicial district—elected for six years; and a judge for every county, elected every four years. The Legislature of 1911 created a court of appeals to consist of five judges appointed by the Governor for a term of four years. This court is to supplement the work of the Supreme Court, which may transfer cases to it. A constitutional amendment adopted in 1912 provided for the recall of judges and certain judicial decisions.

Local Government.—Three county commissioners (five permissible in counties exceeding 70,000) are elected in every county, the term of office being four years. Other county officers, elected on the first Tuesday in October of the even years, are: clerk, sheriff, coroner, treasurer, superintendent of schools, surveyor, and assessor. Towns and cities may be classified into not more than four classes, and the powers of each class are defined by general laws. Cities and towns have been granted the power to adopt a commission form of government. At the end of 1913 the following towns and cities were under this form of government: Colorado City, Colorado Springs, Denver, Durango, and Pueblo. Most of the charters of these cities include provisions for preferential voting on ballots for commissioners. Voters may mark candidates as first, second, or third choice. Charters for the most part contain also provisions for the initiative, referendum, and recall. A constitutional amendment adopted in 1912 gave cities and towns home rule in municipal affairs.

History. Prehistoric remains, similar in character to those discovered in New Mexico and Arizona, have been found in southern Colorado. In the second half of the eighteenth century several expeditions into the limits of the present State were undertaken by the Spaniards. The most important of these was the one headed by Francisco Escalante, who in 1776 traversed the southwestern corner of the State and explored the region of the Dolores and Gunnison rivers. But though Spain claimed the region, she attempted no settlement. The country, a portion of which was included in the Louisiana Purchase (1803), was partially explored in 1806–07 by Captain Pike and in 1820 by Colonel Long. Further exploration was carried on by Frémont in 1842 and 1844, and before the Mexican War fur-trading stations had been built on the Arkansas and Platte rivers. In the Treaty of Guadalupe-Hidalgo (1848) Mexico relinquished her territorial rights to the United States. Prospectors and emigrants from Georgia and Kansas entered Colorado in 1858. In 1859 the discovery of gold near Boulder and Idaho Springs was followed by a large immigration and the sudden rise of the mining towns of Denver and Boulder. The region, together with lands taken from Nebraska and New Mexico, was organized into the Territory of Colorado on Feb. 28, 1861. From 1864 to 1870 wars were waged with the Cheyenne and Arapaho Indians. The Utes ceded the mountain and park regions between 1863 and 1880. In 1864 and 1868 unsuccessful attempts at organizing a State government were made. The final enabling act was passed by Congress on March 3, 1875, and on Aug. 1, 1876, Colorado was admitted into the Union. Gold digging was on the decline in 1878, and many mining towns

were being deserted, when it was discovered that from the masses of carbonates discarded by the gold seekers silver and lead might be extracted. Immigrants flocked to Leadville, and soon the value of the lead and silver output came to excel the yield of gold. Serious strikes broke out among the miners in 1894, 1896–97, and 1904, and recourse was had to military force to restore order. The greatest disturbance was that of 1904, during which the strikers blew up the railway station at Independence, killing fifteen non-union miners and injuring several others. In an endeavor to quell the disorder suspected persons were deported from the State, attempts were made by the soldiery to intimidate the courts, and the writ of habeas corpus was suspended by the Governor. These measures, which aroused much criticism throughout the United States, were largely actuated by the Citizens' Alliance, an organization formed with the avowed purpose of exterminating the Western Federation of Miners. From 1876 to 1888 Colorado was Republican in national politics, but on the free-silver issue it was carried by a fusion of Populists, Democrats, and Silver Republicans in 1892, 1896, and 1900. In 1904 the State again gave its electoral vote to the Republicans. The State election in 1904, however, was bitterly contested. The attitude of Governor Peabody, the Republican candidate, during the mining troubles, lost him the support of a large part of the labor element, and the returns showed the election of Adams, Democrat. A contest ensued, and the Republican Legislature seated Peabody, who resigned immediately afterward and was succeeded by McDonald, the Lieutenant Governor.

In 1906 Henry A. Buchtel, a Methodist Episcopal clergyman and chancellor of the University of Denver, was elected Governor on the Republican ticket. The Legislature of 1907 elected Simon Guggenheim, one of the heads of the American Smelting and Refining Company and a capitalist of national repute, United States Senator. In the presidential election of 1908 Bryan received 126,772 votes; Taft, 123,732. In this year the Democrats elected their first Governor since 1905. J. F. Shafroth, Democrat, received 128,898 votes, against 118,832 cast for McDonald, the Republican candidate. The Democratic National Convention of 1908, which nominated Mr. Bryan, was held in Denver July 9–14. An auditorium costing $650,000 and seating 10,000 persons was erected for the purposes of the convention. The Legislature of 1909 elected Charles J. Hughes, Democrat, United States Senator, to succeed H. M. Teller. On September 28 of this year the Gunnison tunnel, a part of the Uncompahgre irrigation project, was formally opened by President Taft, who was at that time making a tour of the Western States. (See paragraph *Irrigation* above.) In 1910 Governor Shafroth was reelected. Senator Hughes died on Jan. 11, 1911. The Legislature was in a deadlock over the election of his successor throughout the entire session and was obliged to adjourn without an election, and Colorado was represented in the sixty-second Congress by only one Senator. In December, 1912, Senator Guggenheim announced that he would not be a candidate for reëlection. This necessitated the election of two Democratic Senators by the Legislature of 1913. John F. Shafroth was elected for the full term, and for the short term Charles S. Thomas, who was Governor of the State from 1899 to 1901, was chosen. In the presidential election of Nov. 5, 1912, Wilson received 114,223 votes, Roosevelt 72,306, Taft 58,386, and Debs 16,418. For Governor, E. A. Ammons, Democrat, received 101,293 votes; Costigan, Progressive, 63,035; Parks, Republican, 54,724. The Democrats elected all Representatives to Congress. The Legislature of 1913 was Democratic by more than 40 on a joint ballot. By the reapportionment as a result of the census of 1910, the State has four Representatives in Congress instead of three as formerly. There were serious strikes in the mining regions in the early part of 1914. For an account of these, see STRIKES.

TERRITORIAL GOVERNORS

William Gilpin	1861–62
John Evans	1862–65
Alexander Cummings	1865–67
A. C. Hunt	1867–69
Edward McCook	1869–73
Samuel H. Elbert	1873–74
Edward McCook	1874–75
John L. Routt	1875–76

STATE GOVERNORS

John L. Routt	Republican	1876–79
Frederick W. Pitkin	"	1879–83
James B. Grant	Democrat	1883–85
Benjamin H. Eaton	Republican	1885–87
Alva Adams	Democrat	1887–89

COLORADO. A city and the county seat of Mitchell Co., Tex., 262 miles by rail west-southwest of Dallas, on the Colorado River and on the Texas and Pacific Railroad (Map: Texas, B 3). It is the commercial centre of a cotton-growing and stock-raising region, carries on a trade in sand and gravel, and has extensive salt works and cotton gins. The water works are owned by the city. Pop., 1910, 1840.

COLORADO, *Sp. pron.* kō'lō-rä'dō. A name given by the Spaniards to various unrelated tribes in different parts of Spanish America, including Texas, owing to their custom of painting the body with red pigment. Of the tribes thus known, one of the most noted was that of the Sacchas, "men," as they call themselves, of whom a few still survive in the upper valleys of the Daule and Chones rivers, in northwestern Ecuador. They go naked and are naturally light-skinned, almost blond, but paint their whole bodies with a red paint. They belong to the Barbacoan stock.

COLORADO, Río, rō'ō. A river of central

Argentina, rising in the Andes and flowing southeast. It empties into the Atlantic in about lat. 39° 50′ S. (Map: Argentina, E 11). Its entire length is about 700 miles, but it is navigable for light vessels for only 200 miles. The upper course is through a desert.

COLORADO, UNIVERSITY OF. An institution of higher learning situated at Boulder, Colo. It was incorporated by the Territorial Legislature in 1861, and in 1876 the constitution of Colorado provided for it as the State University. At the formal opening of the institution in 1877 it consisted of a College of Liberal Arts and a preparatory department (the preparatory department was discontinued in 1907). The university in 1914 comprised the following schools and colleges (with date of establishment): the College of Liberal Arts, 1877; School of Medicine, 1883; Graduate School, 1892; School of Law, 1892; College of Engineering, 1893; Summer Session, 1904; College of Commerce, 1906; College of Education, 1908; School of Pharmacy, 1911; University Extension, 1912; and School of Social and Home Service, 1912. The following degrees are offered: B.A., M.A., Ph.D., M.S., C.E., E.E., M.E., D.Oph., M.S. in Public Health, Doctor of Public Health, M.S. in Sanitary Engineering, B.S. (C.E.), B.S. (E.E.), B.S. (M.E.), B.S. (Ch.E.), M.D., Ph.C., B.Phar., B.S. in Phar., LL.B. The university is coeducational. The library contains 75,000 bound volumes besides maps and pamphlets. The total registration in 1913–14, not including the Extension Division and the Summer Session, was 1250. The university is supported by a two-fifths mill tax and special appropriations. Its government is vested in a board of six regents elected by the people. The president in 1914 was Livingston Ferrand, A.B., M.D.

COLORADO CITY. A city in El Paso Co., Colo., 75 miles south of Denver, on the Colorado Midland and the Denver and Rio Grande railroads (Map: Colorado, E 3). It contains gold-reduction works, railway shops, and an iron foundry, and has a Carnegie library. The commission form of government was adopted in 1913. Pop., 1900, 2914; 1910, 4333.

COLORADO COLLEGE. An institution of higher education, founded at Colorado Springs, Colo., in 1874. The college offers courses leading to the bachelor's degree in arts, science, and philosophy. The college has departments of engineering, forestry, and of business administration and banking. It has 14 large stone buildings, costing $1,000,000 with their equipment. The library contains 110,000 volumes, and the endowment is $1,040,000. In 1913–14 it had 679 students, with standards the same as the best Eastern institutions. It has a system of exchange instructors with Harvard University. The president in 1914 was W. F. Slocum, LL.D., D.D.

COLORADO DESERT. A portion of the great arid region of southeastern California and the contiguous part of Nevada, generally known as "the Desert." The more important subdivisions of this region are called the "Colorado Desert," the "Mohave Desert" (q.v.), and "Death Valley" (q.v.). The Colorado Desert extends southward from San Gorgonio Pass (between the San Bernardino and the San Jacinto mountain ranges). Its general northern boundary is roughly outlined by the San Bernardino, Cottonwood, Chuckwalla, and Chocolate mountain ranges, north of which lies the Mohave Desert. It comprises about 2000 square miles and includes chiefly the western portion of Riverside County, the eastern portion of San Diego County, and the western half of Imperial County. Much of this region lies below sea level; the lowest area is the Salton Sink, within which lies the Salton Sea (q.v.). The Salton Sink, in a comparatively recent geological period, was a part of the Gulf of California, from which it is now separated by the delta of the Colorado River. Topographically this entire desert area is characterized by a series of approximately parallel mountain ranges, between which lie desert valleys. The trend of these mountains in the northern part of the desert is north and south, or nearly so, while the ranges in the southern part swing to the southeast.

The desert is due chiefly to the effect of the Sierra Nevada Mountains, which condense upon their westward slopes practically all of the moisture in the winds from the Pacific. During the five summer months the heat in the desert valleys is intense, frequently reaching 125° F. in the shade and rarely falling below 70°, the average being about 90°. Men subjected to these conditions without water (of which very little is to be had) generally perish quickly. Rain falls frequently upon the mountains, and sometimes in the valleys, but the air generally is in active movement, and the winds quickly dry the surface of the ground. Sudden cloudbursts, accompanied by startling electrical displays, are not uncommon in the mountains, where the resulting flood waves develop enormous erosive and transporting energy. Railroads traversing this country are often damaged by these storms. The normal rainfall for the desert is between three and four inches annually. For a description (with a good map) of this region, consult Mendenhall, "Some Desert Watering Places in Southeastern California and Southwestern Nevada," *Water-Supply Paper 224, United States Geological Survey* (Washington, 1909); also the authorities cited under CALIFORNIA.

COLORADO RIVER OF THE WEST. A large river flowing through the plateau region of the southwestern United States. It is formed in the southeastern part of Utah by the junction of the Green River from the north (the upper continuation of the Colorado) and the Grand from the northeast, the former rising in southwestern Wyoming in the Wind River Mountains, and the latter in the north-central part of Colorado (Map: United States, C 3). These head streams receive numerous tributaries from the well-watered heights of the Rocky Mountains and the Wasatch. These streams are extraordinary, but below their junction the Colorado passes through what is in some respects the most remarkable region on the earth, not only for its natural scenery, but also for the great interest which it possesses for geologists, as it gives on a mighty scale the clearest exemplifications of the action of erosive forces in shaping the contour of the land and presents vertical structural sections of vast extent unmasked by vegetation. In the Eocene epoch the whole region of Arizona, Utah, and Nevada was subjected to a vast upheaval, and what was formerly the bottom of the ocean was raised to a height of more than 10,000 feet above sea level. This region, consisting chiefly of horizontal strata of the Paleozoic and Meso-

zoic systems, was subjected to extensive denudation by wind and water, and again to successive upheavals accompanied by volcanic action. In the northwestern part the strata were faulted into huge blocks, running north and south, giving the present shape to the mountains of Nevada. The result of the uplifting and erosion was the washing away of the weaker and softer strata, especially to the west of the present course of the Colorado, while those rocks that were protected by harder layers were left standing as extensive plateaus with precipitous escarpments. In some places lavas have been thrust up through the strata by volcanic action, and volcanic cinder cones and craters are numerous, one small lava flow in the Uinkaret locality being so recent that no vegetation has found root on it. For a time the Colorado itself was dammed up by a lava overflow from above at this place. The precipitation is heaviest on the high mountains, diminishing according to altitude; and, in a general way, also according to latitude, towards the southwest, where in the valleys it is very light, in places less than 5 inches. Denudation therefore proceeds much more rapidly along stream beds, even where these, as is frequently the case, are dry for a great part of the time, with the result that the stream beds are depressed to great depths below the surrounding levels, giving rise to a multitude of profound gorges or cañons. These begin with Flaming Gorge on Green River, near the south boundary of Wyoming where the river cuts into the Uinta Mountains, and they encompass the river and its tributaries, with few breaks, for 1000 miles, to the foot of Black Cañon. Grand River flows through similar cañons and joins the Green in a gorge 1300 feet below the general surface of the plateau. The largest, longest, and deepest of these remarkable chasms is the famous Grand Cañon of Arizona, in the northern part of that State, where the Colorado passes through an enormous uplift called, south of the cañon, the Colorado Plateau, and north of it, the Kaibab, Kanab, Uinkaret, and Shiwits plateaus, differentiated by variations of altitude from about 6000 to 8500 feet above the sea. The Grand Cañon, 217½ miles long, 4000 to 6000 feet deep, and from 1 or 2 to 15 miles wide at the top, is immediately preceded in the series by Marble Cañon, 65½ miles long, 3500 feet in its maximum depth, and ½ mile to 2 miles wide at the top, with only a nominal separation from the Grand Cañon, thus making a continuous chasm 283 miles long as the river runs. In two of its sections the Grand Cañon is made up of two distinct chasms: an inner, cut in archean rock, and an outer in sedimentary rock, the latter being very wide and the former very narrow. This is mainly caused by the disparity in hardness of the rocks, as is evident from the fact that where the trend of the river eliminates the archean formation there is no defined inner gorge, although in other parts the main chasm is flanked above by a line of cliffs marking the summit of the plateau, and set some distance back, the level interval being called the esplanade. Everywhere the configuration is due to structural conditions acted on by weather and water.

The Grand Cañon ends at the Grand Wash, where the cliffs retreat north and south, terminating the great plateau. Several minor cañons follow, and at about 113° 45′ the river swings sharply to a straight south course, passes through the last important gorge, Black Cañon, and flows thenceforth with less declivity in comparatively open country all the way to the Gulf of California. It forms here the boundary between Arizona and Nevada and California. The river is navigable for properly built steamboats of light draft as far as the foot of Black Cañon, but the enormous quantity of shifting silt makes progress uncertain. The first white man on the river was Hernando Alarcon, commander of the marine division of the Coronado expedition, who discovered its mouth in 1540 and ascended in small boats to about the thirty-fourth parallel. The same year Cardenas, in command of one of Coronado's land divisions, came to the south rim of the Grand Cañon. In 1776 Padre Escalante, coming from the northwest, crossed about where latitude 37° intersects the river, and this place ever since has gone by the name of "Crossing of the Fathers." In 1825 General Ashley took his band of trappers in boats down the Green as far as Brown's Park, and in 1849 William L. Manly, with several others, went in a boat from the emigrant crossing near the present Union Pacific bridge down to the Uinta valley. One or two other parties attempted to descend about this time. The name "D. Julien, 1836" is carved into the rock in three places in the cañon near the junction of the Green and Grand, but that is all that is known about Julien. Early in 1858 George A. Johnson, who for several years had navigated between Fort Yuma and the Gulf with steamboats, took one, named the *General Jesup*, as far up the river as the head of Black Cañon, about lat. 36° 05′. On his return he met the government expedition under Lieutenant Ives, with the steamer *Explorer* on the way up. Ives got to the foot of Black Cañon with his steamer. In 1866 Captain Rodgers took the steamer *Esmeralda* as far up as Callville (about to Johnson's limit), and the next year, 1867, a man named James White was picked up at Callville in a famished, exhausted condition, whose story led to the belief that he had come down through the Grand Cañon. The fact is that he entered on the river below the end of the great gorge, and his story shows that he knew nothing about it, but at that time neither did any one else; he actually knew very little about any of the country.

The first human beings of any color or condition known to have made the passage of the Grand Cañon were Major John Wesley Powell and the remnant of his party which had started from Green River, Wyoming, May 24th, 1869, reaching the mouth of the Virgin August 30th. In 1871–72 Powell made a second descent, this time for the government. In 1871 Lieutenant Wheeler, U. S. A. Topographical Engineers, proceeded up the river with boats, from Fort Mohave, going as far as the mouth of Diamond Creek, by means of much pulling, towing, and dragging over portages. Twenty years later (1889) F. M. Brown started a railway survey along the river from Blake, Utah. He and two of his men were drowned in Marble Cañon, and the expedition failed, but R. B. Stanton reorganized it with better boats and completed the descent the next year. Others have in recent years been the entire length of the river; but it is always a hazardous undertaking.

The total length of the stream from the head of the Green is about 2000 miles; from the junction of the Grand, about 1100. The area drained is approximately 300,000 square miles. The declivity is very great, the total river fall from the Union Pacific crossing to the end of the Grand Cañon being 5235 feet. The river fall in Marble-Grand Cañon is 2330 feet. Rapids are counted by hundreds. The sharpest single descent is the Sockdologer Rapid, with a fall of about 35 feet in one-third of a mile, in the Grand Cañon. The river varies in width from hardly 75 feet in places among the rocks to a quarter of a mile in open places and more in the lower reaches. The depth changes with the seasons and with locality. In the narrowest parts of the Grand Cañon it is at times more than 100 feet. The great rise occurs in May and June, but rains in July frequently cause sudden and great increase in volume. The velocity of the current is sometimes more than 25 miles an hour. Consult: Report of Lieut. J. C. Ives on the *Exploration of the Colorado River* (1861); J. W. Powell, *Exploration of the Colorado River of the West and its Tributaries* (1875); F. S. Dellenbaugh, *A Canyon Voyage* (1908), giving the only story of Powell's second descent; id., *The Romance of the Colorado River* (history); C. E. Dutton, "Tertiary History of the Grand Canyon of the Colorado," in *Monograph II, United States Geological Survey* (1882); the various writings of William Morris Davis; G. W. James, *In and Around the Grand Canyon* (1902); id., *The Grand Canyon of Arizona, How to See It* (1910).

COLORADO RIVER. A river rising in the western part of Texas, near the southeastern boundary of New Mexico (Map: Texas, C 4). It flows in a generally southeast direction across the State and empties into the Gulf of Mexico through Matagorda Bay. Its chief tributaries (all received from the west) are, from north to south, the Concho, San Saba, and Llano, which enter the main stream in the counties of the same name. The Concho supplies a steady volume of water greater in amount than that of the Colorado at their confluence, furnishes much water power, and serves efficient irrigation systems in Irion and Tom Green counties. The drainage of the Colorado embraces about 37,000 square miles above Austin, and about 40,000 square miles above Columbus. At Austin the river emerges from a cañon, and has a discharge of about 70,300 second feet. Below this point it flows through a generally level country, where it supplies water power and is used for rice irrigation, especially in Colorado, Wharton, and Matagorda counties. The river is about 900 miles long and is navigable for steamboats to Austin. The other chief towns on its banks are Bay City, Wharton, Columbus, Lagrange, and Bastrop. It is frequently called the "Eastern Colorado," to distinguish it from the larger and better-known river—the Colorado River of the West—which empties into the Gulf of California.

COLORADOS. An important tribe of Indians belonging to the Barbacoan stock (q.v.) and living on the upper courses of the rivers Esmeraldas, Daule, and Vinces, in northern Ecuador. They have been studied by Selee, Gonzalez Suarez, Beuchat, and Rivet. See BARBACOAN.

COLORADO SPRINGS. A city and the county seat of El Paso Co., Colo., 74 miles south by east of Denver, on the Atchison, Topeka, and Santa Fe, the Denver and Rio Grande, the Chicago, Rock Island, and Pacific, the Colorado and Southern, the Colorado and Midland, and the Colorado Springs and Cripple Creek District railroads (Map: Colorado, E 3). Its location, 6000 feet above sea level, near the base of Pike's Peak and the celebrated mineral springs at Manitou, have made the place one of the most popular health resorts in the United States. It is the seat of Colorado College, founded in 1874, and contains the Colorado School for the Deaf and Blind, the Union Printers' Home (international), national sanitarium of the Modern Woodmen of America, and the Myron Stratton Home for the Poor. There are many places of historic and scenic interest in the vicinity, notably Pike's Peak (q.v.), Ute Pass Highway, Garden of the Gods (q.v.), an old Indian trail, Cripple Creek, North and South Cheyenne Cañons, Glen Eyrie, Cave of the Winds, and Phantom Cliff Cañon. The city has also a beautiful system of parks, comprising 3000 acres. The chief industries are the refining and reduction of ores, coal mining, and the manufacture of tile and pottery. Settled in 1871, Colorado Springs was incorporated in 1872 and is governed under a special charter, adopted in 1909, which provides for the commission form of government. The city owns its water system, valued at $3,000,000, which brings from the streams and reservoirs on the slopes of Pike's Peak water noted for its purity. Pop., 1890, 11,140; 1900, 21,085; 1910, 29,078; 1920, 30,105.

COLORADO STATE AGRICULTURAL COLLEGE. A scientific school of agriculture and the mechanic arts, situated at Fort Collins, Colo., organized in 1876. The college received 90,000 acres of the lands granted to the State in 1862, and since its inception has been supported chiefly by a State tax and acts of Congress. Its gross income is about $170,000. It offers courses leading to the B.S. and M.S. degrees in engineering, agriculture, and home economics. It also includes a School of Veterinary Medicine, requiring four years to gain the degree of D.V.S. Women are admitted on equal terms with men. The library contains about 50,000 volumes. The attendance in 1913 was about 500 in collegiate grade. It also conducts a School of Agriculture of secondary grade with an attendance of over 400, and a Conservatory of Music with an attendance of over 100. The activities of the college are divided into education, research, and extension. The president in 1914 was Charles A. Lory, LL.D.

COLORATION IN ANIMALS. See BIRD; INSECT; PROTECTIVE COLORATION; MIMICRY.

COLOR BLINDNESS, ACHROMATOPSIA, or DALTONISM. An incurable defect of vision, owing to which some persons are unable to distinguish certain colors. The name "Daltonism" is derived from Dalton, the English chemist who, in 1794, discovered the condition and himself suffered from the defect. Acquired color blindness is a symptom of diseases of the optic nerve and retina. Congenital color blindness usually affects both eyes and is often hereditary, and may be partial or complete. It is found in from 3 to 4 per cent of men and less than 1 per cent of women. It occurs in eyes whose power of vision may be otherwise (as to form and distance) perfect, but errors of refraction usually coexist. It is usually partial, being a

failure to distinguish one or two of the fundamental colors—red, green, and blue. The eyes of persons having this defect of vision have been carefully examined after death without the discovery of any peculiarity. Color blindness therefore has its seat in the sensorium, not in the visual apparatus. The Hering theory is that the retina contains three pairs of visual materials—white-black, red-green, and blue-yellow. Color blindness is accounted for by the supposed absence of one or two of these substances. According to the Young-Helmholtz theory there are three primary color perceptions—for red, green, and violet. In the absence of one of these a color appears composed of the others. The most common forms of color blindness are red blindness, green blindness, and red-green blindness. To detect the defect, the method of having the patient name colors is not satisfactory, because colors may be differentiated by apparent differences of brightness. Professor Holmgren of Upsala, Sweden, devised a series of test wools which furnish the best means of recognizing defects. These are skeins of wool of certain colors ("test colors"), various tints and shades of the same colors, and so-called "confusion colors." When the patient attempts to match the colors with the other skeins, the confusion colors are often added also, and it may be noticed that there is some hesitancy in making the selections. See VISUAL SENSATION — THE COLOR TRIANGLE.

Acquired color blindness may result from disease or accident. It is a symptom of toxic amblyopia brought on by the excessive use of tobacco and alcohol. An important fact in regard to tobacco amblyopia is that the subject may show no signs of color blindness when looking at the objects near at hand, but is unable to distinguish colors at a distance. The Holmgren test would be insufficient in such a case.

The question has received serious legislative attention, and in most of the States of the Union stringent laws have been passed regarding the examination of the vision of all who depend on colors for their guidance. It is a crime in color-blind persons to pursue any calling when their defect, known to them, is liable to injure others, and it might be added that it is foolish for a color-blind painter, tailor, or milliner to attempt to compete with those who have perfect vision.

The safety of the traveling public depends in large measure upon the accuracy with which green or red signals are observed by employees of railways and ships. The colors selected for signals by transportation companies are unfortunately those which are most usually confused by the color blind—red and green. In Sweden, since 1877, only men with normal color vision have been employed in the railway service. In Holland the government controls the matter efficiently. In Italy, while there is no special law, the employees are tested. In France, in the absence of law about examination, Holmgren's test is usually employed. In Germany examination of color sense is prescribed by law. In Austria, on the state railroads, examination is made. In England there is no government regulation, the tests employed by certain companies being considered sufficient. In the United States examination for color blindness among the employees of transportation companies is general, in connection with tests for visual acuity, hearing, and other physical examinations. In some states the tests are required by law, in others, as in New York, the railroad commissioners formulate regulations. Visual tests were first begun in 1880 by Dr. William Thomson, among the employees of the Pennsylvania Railroad. In 1887 the same tests were adopted by the Philadelphia and Reading Railroad. The New York Central instituted color tests about 1890; and by 1902 the majority of the 128 railroads included in the American Railroad Association had adopted some form of color tests. Since that time the practice has become practically universal.

Chromatopsia is a condition in which objects appear tinted with certain colors. The phenomenon is common after cataract operation and may be caused temporarily by certain drugs. Large doses of santonin, e.g., often cause objects to assume a yellow tinge.

COLORED FIRE. See PYROTECHNY.

COLORED HEARING, or CHROMÆSTHESIA. The anomalous association of colors with sounds. It is the commonest type of synæsthesia, or the formation of unusual connections between sensations of different sense departments. While colored hearing is relatively frequent (statistics record one person in eight), it is exhibited in very varied forms. These may, however, be grouped, in the first place, with regard to the nature and intensity of the photism (the color which is induced), and, secondly, with regard to the nature of the inducing sound. The induced color may in rare cases be of hallucinatory intensity, so as to be seen objectively when the eyes are open. Usually the intensity is less—the photism is localized (Flournoy), though not projected. In the third grade the photism is "imagined"—the color is really present as a visual sensation, but has no definite place; e.g., all soprano voices may be white, all tenor voices green. Fourthly, photisms may be simply "thought," no visual sensation being present. Finally, certain persons possess "negative photisms"—they cannot say what color a sound has, but can say what colors it "ought not" to have. Any auditory impression may serve as the inducing agency. The sources may, therefore, be grouped, for convenience, as (1) musical tones and noises (subdivided into single notes, chords and discords, musical selections, etc., each with further arrangement according to pitch, intensity, clang tint of instrument), and (2) articulate speech (vowels, consonants, words, sentences).

Can we find any uniform relation between these two series of variables, the inducing sound and the induced color? Certain investigators, using the questionary method, have answered in the affirmative. Thus, Bleuler and Lehmann say that "sharply demarcated, small, bright, or pointed photisms are aroused by high-pitched sounds. Red, yellow, and brown are frequent colors; violet and green are rare; blue stands midway in frequency. The tendency to secondary sensations (synæsthesia) is inheritable." Other investigators, who have made detailed experimental studies of a few individuals, contend that the questionary method is inadequate

and that there is a considerable degree of variation, not only between individuals, but also for the same individual at different times, so that "generalization is at present to be avoided."

Numerous theories in explanation of colored hearing have been proposed, though no one of them is entirely satisfactory. The evidence seems, however, to favor a theory which regards the colored "image" as belonging to the domain of sensation rather than to that of the image proper. An adequate explanation, therefore, must be sought in some unusual condition of the brain, and not, as has frequently been suggested, in the association of ideas. The absence of abnormality is attested by the facts that colored hearing is no more frequent among neurotic than among normal individuals and that the associations do not interfere with mental operations. They may, indeed, furnish positive sources of pleasure to their possessor. See SYNÆSTHESIA.

Whipple, *American Journal of Psychology*, vol. vi (Worcester, 1900); Gruber, *L'Audition colorée et les phénomènes similaires* (Paris, 1892); Titchener, *Text-Book of Psychology* (New York, 1910).

COLORED METHODIST EPISCOPAL CHURCH OF AMERICA. See METHODISM.

COLOR GUARD. A military escort for national and regimental colors. (See COLORS.) Formerly a position of great honor and considerable danger when on active service; now used only on regimental parades, reviews, and inspections. The United States Infantry Drill Regulations define the composition of a color guard as "two color sergeants, who are the color bearers, and two experienced soldiers, selected by the colonel."

The colors (national and regimental) are kept at the office or quarters of the colonel, unless required on parade, in which case they are escorted by the color guard, marching in one rank, the color bearers in the centre.

COLOR PHOTOGRAPHY. The reproduction by photography of natural objects in their own colors. There is no means known at present by which, using ordinary photographic processes, this is possible. When a photograph is taken with a camera and a sensitive plate, the developed negative shows an image of the object in various shades of gray, which depend upon the sensitiveness of the photographic plate to the ether waves characteristic of the colors of the natural object. It is possible so to stain a photographic plate that it is more or less sensitive to all colors; but the developed negative is always gray, except possibly for certain accidental colors which have not the faintest connection with those of the object photographed. To reproduce the colors, therefore, other methods are essential, and there are at the present time two quite distinct processes.

One of these is based upon the work and a suggestion of Prof. J. Clerk Maxwell (1831–79), of the University of Cambridge. He showed that if there were produced simultaneously in the normal eye three sensations—viz., definite shades of blue, green, and red—the eye could be made to perceive any desired color of the spectrum by properly adjusting the intensities of these three component sensations. Thus, if by any means—e.g., by sets of mirrors—the eye can be made to see at one time three ordinary photographs of any natural object, looking at one through a piece of red glass, another through a piece of green glass, and a third through a piece of blue glass, the eye will see the object in its natural colors, *provided the intensity of the deposit of silver on the original three negatives is so adjusted for each negative that the intensities of these red, green, and blue sensations are exactly such as to produce the proper color sensations.* To secure this intensity on the photographic plates, three photographs of the object must be taken, each through such a colored screen as will transmit enough light of all wave lengths to produce the desired result on the plate. Thus, one plate is exposed in a camera in front of which is a screen which allows to pass a great deal of red and small amounts of yellow and green; the second is exposed with a screen which is transparent to the green and slightly to yellow and blue; the third is exposed with a screen which is transparent to blue and slightly to green and violet. It is a question of the most careful experimenting to find what photographic plates should be used, and what colored screens give the proper intensity with them.

There are several processes of color photography based upon this general idea. In the process due to F. E. Ives, the three photographs of identical sizes are taken simultaneously on three plates, each through its proper "taking" screen. From these three negatives three positives are made by contact; and these positives, each with its proper "viewing" screen of pure red, green, or blue, placed in a so-called "kromskop" in such a manner that sunlight is reflected through them and their screens, and all three pictures are seen superimposed apparently on each other. In another process invented independently by Professor Joly, of Dublin, and Mr. McDonough, of Chicago, the three colored screens through which the photographs are taken are combined by having a series of lines of these three compound colors ruled very closely together on a piece of glass, every fourth line having the same color. A single photograph is taken through this composite screen; a positive is taken of this, and a viewing screen, consisting of a series of lines—one a pure red, the next pure green, the next pure blue—with the same spacing as in the taking screen, is superimposed on the positive, so that the colored lines come in exactly the proper positions; and this compound plate is used as a transparency by holding it up to the light, or by looking through it at a piece of white paper which is brightly illuminated.

Quite a different process, although of the same general principle, has been invented by Professor Wood, of Johns Hopkins University. It depends for the production of the pure colors, red, green, and blue, upon the phenomena of diffraction gratings (q.v.), by means of which white light may be dispersed into pure colors. (For details concerning this process, consult the references given at the end of this article.)

The most prominent modern system of color photography is that based upon the use of the autochrome plate, which has been perfected by Lumière Frères. The principle underlying the production of this plate is briefly as follows: upon a piece of clear glass numberless starch granules are caused to lie side by side, some of the granules having been dyed red, others green,

and the remainder blue. By filling in the interstices between the granules with opaque material the light transmitted by the plate comes through a single layer of dyed starch granules which have been so thoroughly mixed that the plate has a grayish appearance. Upon this minute mosaic there is flowed a photographic emulsion sensitive to the entire visible spectrum. The plate is exposed in an ordinary camera, the glass side of the plate being towards the lens. To make clear the behavior of the plate, let it be assumed that a red blossom is being photographed. The red light in the image of this blossom will have to pass through the starch granules before reaching the sensitive emulsion and, as only the red granules will transmit this light, the emulsion is acted upon only at the spots underlying red granules. The plate is next developed and then "reversed," i.e., portions which had developed out black are made transparent and vice versa. Since, now, the spots under the red granules alone have become transparent and since only those lying within the extent of the image have been affected, a beautiful colored image of the blossom is seen as the plate is viewed in transmitted light.

In contrast to Ives's process, the above suffers from the defect that the "taking" and the "viewing" screens, i.e., the starch granules, must necessarily be the same. While this circumstance brings about a loss of fidelity in the reproduction of certain spectral colors, the method is nevertheless capable of yielding very beautiful results, even in the hands of amateurs.

An entirely different physical principle is made use of in the Lippmann method of color photography; it depends upon the fact that the colors seen by the eye are caused by ether waves of different wave number; and so, under proper precautions, it is possible to have "stationary vibrations," so called, produced. If one vibrates rapidly the end of a long rope, the other end of which is fastened to a wall, waves are sent along the rope; reflected waves are produced; and, as the direct and reflected waves are thus superimposed, there are certain points, regularly spaced, where the two waves neutralize each other's action, while in between these "nodal" points the string vibrates exactly as if it were an ordinary string stretched between two fixed pegs. This is called a stationary vibration; and the distance between two nodal points equals half the wave length of the train of waves which is the original cause of the vibration. The same phenomenon may be produced by ether waves if allowed to fall upon a mirror. In Lippmann's process a photographic plate of particularly fine grain is placed so as to form one side of a bath containing mercury, the film side being in contact with the mercury. If light of a definite color falls upon the photographic plate, the waves enter the film, reach the mercury, are reflected, and form stationary vibrations. In between the nodes there will be chemical action, which is thus confined to plane surfaces, parallel to each other and very close together, their distance apart depending upon the wave number of the light. If this photographic plate is now suitably developed, the nodal planes will be dissolved out largely, thus forming of the film a pile of parallel plates at minute intervals. If such a pile of plates is viewed with white light, it will appear to be of the same color as that of the light which produces the chemical action, owing to the phenomena of interference (q.v.). Similarly, if the colored light from any natural object falls upon the film in its original condition, each color will produce its own stationary vibration and its own set of parallel planes, where there is chemical action; and so, when developed and viewed in white light, the image will have the proper colors of the object itself. (The above explanation of the Lippmann process is not complete; it offers but a rough idea as to what takes place. In fact, a satisfactory explanation of all the phenomena is not known.) Recent work of H. E. Ives has shown that if a slow, clean working developer be used, and if the developed plate be bleached with mercuric oxide, films containing hundreds of laminæ may be produced. These laminæ impart to the film so high a resolving power that spectral colors of great purity are reflected back when white light is incident upon the plate.

To print in the natural colors the photograph of any colored object is perfectly possible by a simple modification of the method of Ives or of Joly-McDonough, which will be found discussed under THREE-COLOR PROCESS. For additional information, see: Wood, *Philosophical Magazine*, vol. xlvii (London, 1899); Joly, *Nature*, vol. liii (ib., 1895–96); Lippmann, *Proc. Royal Society of London*, vol. lx (ib., 1896); Wiener, *Smithsonian Report* (Washington, 1896); Bolas, Tallent, and Senior, *A Handbook of Photography in Colors* (New York, 1900); Donath, *Die Grundlagen der Farbenphotographie* (Brunswick, 1906); R. Child Bayley, "The Autochrome Plate," in *Scientific American*, vol. xcvii, pp. 42–43 (1907); J. H. Powrie, *Photographic Journal*, vol. xlviii, pp. 3–9 (1908).

COLOR PRINTING. See THREE-COLOR PROCESS; LITHOGRAPHY.

COLORS, MILITARY AND NAVAL. The term applied to the national flag or ensign wherever it is displayed and also to other flags, banners, or guidons carried by military bodies and usually indicating their designation. Emblems, banners, or similar devices have been in use among soldiers and sailors from remotest antiquity. They have been conspicuous in the past for their great moral as well as practical value to the troops carrying them. The older and more historic the colors, the greater their moral value; for the soldiers of succeeding generations would vie with each other in maintaining their traditions and adding to their glory, with the result that many of the greatest exploits of military valor have been born of this desire. In practice they were the rallying point of the organization, the embodiment of its history, and the material symbol of headquarters. They have been in use in battle in every army and in every age. In modern armies the colors are still carried in campaign, but not on the firing line as formerly. An exception to this rule is found in British regiments, which, ever since the battle of Isandhlwana (1879), never imperil the colors when engaged in savage warfare. They still retain their historic and moral value. With the British infantry, colors were originally known as *ensigns* (q.v.), each company carrying its own color. This soon gave way to the system at present in use, whereby each regiment or battalion is supplied with a royal or King's color and a regimental color. The former is a *Union Jack* and the latter a flag of the same color as the facings (q.v.) of the regiment, with the blue union in the corner and the title,

number, and honors of the regiment embroidered upon its folds. Both colors are made of silk, measure about 3 feet 9 inches by 3 feet, and are each mounted on a pole of about 8½ feet in length. Cavalry regiments of the Guard carry oblong *standards*, and dragoon regiments, *guidons*. Both types are made of crimson silk. The Royal Artillery, Royal Engineers, Lancers, Hussars, and Rifle regiments do not carry colors. Since the Zulu War of 1880 British troops no longer take their colors with them when on active service.

In the British military service at the public mounting of garrison guards an elaborate ceremony of considerable antiquity, known as *Trooping the Colors*, is often observed. The origin of this custom goes far back and is said to be uncertain, but it is one of the most impressive ceremonies in the formal routine of the British army. The colors, after being received by an officer, are carried under the escort of the color guard from the left to their position at the right of line between ranks of troops. In the military service of other countries various formalities attach to receiving the colors and having the color guard take their appointed positions in ranks while the assembled regiment presents arms, but in no service is the ceremony as elaborate as in the British army. See ENSIGN.

The colors carried in the United States army by the various regiments and battalions are two in number, the national flag (see FLAG) and the regimental color, both of which are of prescribed size and form for the various arms of the service. The flags of mounted regiments are called *standards;* those of dismounted or foot troops, *colors*. The battalions of engineers carry the national flag, with the title of the battalion embroidered in silver on the centre stripe; and the battalion color, of scarlet silk having in the centre a castle, with the number of the battalion placed above the castle, and the words "U. S. Engineers" below. The coast artillery corps have similar colors, on which the corps device of two crossed cannon are emblazoned. Infantry regiments have the same national color as artillery and engineers; the regimental color being of blue silk, the coat of arms of the United States embroidered in silk on the centre, beneath the eagle, a red scroll with number and name of regiment embroidered in white; cavalry standards in size are somewhat smaller than those carried by the infantry and consist of a national flag made of silk. The regimental standard is of yellow silk, with the coat of arms of the United States embroidered in silk on the centre, beneath the eagle a red scroll, with number and name of regiment embroidered in yellow, fringe yellow. The national standard for field artillery regiments is as prescribed for cavalry. The regimental standard, of the same size, is of scarlet silk embroidered as for cavalry except that the number and name of the regiment is in scarlet on a yellow scroll.

According to the *United States Army Regulations* (1913, par. 232) the national and regimental colors and standards will be carried in battle (usually with the main body or reserve), campaign, and on all occasions of ceremony in which two or more companies participate. At other ceremonies it is carried only when specially ordered. The names of battles in which one or more companies of a regiment, or of the battalions of engineers, or of the artillery corps, have borne a meritorious part are engraved upon silver rings fastened on the pikes or lances of the colors. Each troop of cavalry, battery of field artillery, mounted section of engineers, and mounted company of the signal corps, has a guidon (q.v.) on which the numbers or letters designating the command are inscribed. Camp colors are small flags used to mark the location of some particular headquarters or organization.

In naval usage colors play an equally important part. On board old-fashioned ships they are flown at the peak of the spanker gaff, but on recent ships a special flagstaff fitting in sockets at the stern is used for the colors. In port they are hoisted at 8 A.M. and kept hoisted until sunset. On board ships of the United States navy, when the colors are hoisted, they are saluted by a call on the bugle, or the band, if there is one on board, plays the "Star-Spangled Banner." While the colors are going up and the bugle or band is playing, all officers and men on the upper deck face aft and salute as the colors reach the head of the staff. Dipping the colors (i.e., lowering them a short distance and then hoisting them again) is a species of compliment or salute, but United States naval vessels are forbidden to dip their colors except in returning such a salute. Colors are half-masted to express mourning and hauled down to indicate surrender or submission. When colors are carried in a funeral procession, they are draped with black crape. See BUGLE AND TRUMPET CALLS.

COLOR SERGEANT, sär'jent *or* sĕr'-. In the United States army, a noncommissioned officer of the rank of sergeant detailed for the color guard (q.v.). Two sergeants are detailed for each color guard. The senior carries the national, the junior the regimental color. In the British army he is the equivalent, in rank, of the United States army first sergeant, but formerly was one of the noncommissioned officers constituting the color guard, from which fact the present title is derived.

COLORS OF ANIMALS. See EVOLUTION.

COLORS OF THIN PLATES. See LIGHT, *Interference and Diffraction.*

COLOR SYMBOLISM OF THE AMERICAN INDIANS. The Navaho, Osage, Winnebago, Hopi, Arapaho, Sioux, Zuñi, and no doubt many other tribes employed colors to symbolize various religious and mystic concepts. The Sioux and several other Plains tribes used colors to symbolize deeds in a system of heraldry. Each tribe, however, had its own way of associating the colors, so that no general statement of details can be made. Consult *Handbook of American Indians* (Washington, 1907).

COLOS'SÆ (Lat., from Gk. Κολοσσαί, *Kolossai*, also spelled Κολασσαί, *Kolassai*). An ancient city of Phrygia in Asia Minor, situated on the south bank of the Lycus River, where it enters a deep gorge through the ridge that divides the upper from the lower Lycus valley, some distance below which it joins the Mænander. Colossæ was at one time the most important city of southwestern Phrygia, lying on the trade route from Sardis to the south and east. Like its near neighbors, Laodicea and Hierapolis, it probably carried on an extensive trade in the dyed woolen goods for which the region was famed. Unlike Hierapolis, however, it was without natural advantages and was finally outrivaled by the trade of Laodicea. In Roman times the town had lost a considerable share of its former importance. In Byzantine times it

largely retrieved its fortunes and was protected by a fortress built at Chonæ, the modern *Khonas*, on a spur of Mount Cadmus, 3 miles southeast of the city. In the later centuries the population of the city gathered around the fortress, leaving the city finally to disappear. Christianity made its way to Colossæ in the days of Paul, not through his personal visitation (cf. Col. ii. 1), but through evangelistic work directed during his long sojourn at Ephesus (cf. Acts xix. 10), and carried on probably by Epaphras in the general region of the Lycus valley (cf. Col. iv. 12, 13). During his first imprisonment at Rome Paul sent to the city two letters—one addressed to the church and the other to Philemon, an individual belonging to the church. Through the Phrygian element in the membership the church was more or less infested with a mysticism derived from the native religious (cf. Col. ii. 1–19). Consult Ramsay, *Cities and Bishropics of Phrygia*, vol. i (1895). See COLOSSIANS; PHILEMON.

COL'OSSE'UM. See AMPHITHEATRE.

COLOSSIANS, kŏ-lŏsh'ĭ-anz *or* kŏ-losh'anz, EPISTLE TO THE. In the oldest Greek manuscripts the title is simply *πρὸς Κολοσσαεῖς*, 'to the Colossians.' One of Paul's Epistles, addressed to the Christians at Colossæ (q.v.).

This letter, and those sent to the Ephesians and Philemon, make a closely connected group of three writings of the Apostle, addressed to the same general region and written about the same time, probably at Rome during Paul's imprisonment mentioned in Acts xxviii. With Philemon it is connected by an identity of personal references, cf. iv. 9 and Philem. verse 10; iv. 12 and Philem. verse 23; iv. 17 and Philem. verse 2; to Ephesians it is bound by a significant community of contents.

The general outline of the Epistle is as follows: After an *introductory* section (i. 1–13) the Apostle passes almost imperceptibly to an extended statement of the *nature* and *work of Christ* (i. 14–ii. 3). Then he discusses and warns against the *false teachings* by which the church at Colossæ was threatened (ii. 4–23). This is followed by a *hortatory* section, in which the church is urged to live up to the doctrine of the faith (iii. 1–iv. 6), after which *personal* matters, salutations, etc., close the letter (iv. 7–18).

The Pauline authorship of Colossians has been vigorously assailed by such individual critics as Mayerhoff (1838) and Holtzmann (1872), and by such schools as that of Tübingen (1845)—the critics holding that it gives proof of a literary imitation of other writings (Ephesians) which prevents it from being considered genuinely Paul's; the school claiming that it betrays such a presence of second-century Gnostic ideas as to make it necessary to assign it to that post-Pauline age. Neither of these contentions is accepted as valid by the best scholars of the present time. As a matter of fact, assuming, as a working hypothesis, the claim involved in the Epistle's greeting that it was written by Paul, the document shows itself throughout so consistent with the claim as to make it critically impossible to deny its validity.

Within the circle of those who accept its Paulinity, however, the chief question among critics to-day concerns the nature of the errors opposed by the Apostle. From a careful study of the Epistle the following facts are apparent: 1. The errors had not developed to such an extent as to cause separation from the Church (the phrase in ii. 19 "not holding fast to the Head" could hardly be said of full separatists). 2. The teachers were Jews, and Jews of a Judaistic type (the references to circumcision in ii. 11 and to the ordinances of the law in ii. 14 show that Paul was opposing propagandists of a Jewish legalistic character). 3. At the same time they went beyond this type (see the mention of "drink" in the warning of ii. 16, an element which did not enter into the restrictions of the Judaizers; see also the designation of their position as being "according to the traditions of men" (ii. 8), and "according to the precepts and teachings of men" (ii. 22), which would not have been a natural way for Paul to designate the Judaistic position that rested on the authority of the Old Testament law; notice also the absence of all antithesis between faith and works and of any insistence on legalism as necessary to salvation, which were characteristics of the Judaistic propaganda). 4. Further, there are passages which might seem to indicate that these teachers were under the influence of Essenism, though they do not show them to have been Essenes (e.g., ii. 20–23, which describes their regulations as an ascetic severity towards the body—*ἀφειδία*—though asceticism is evidently not represented as practiced as an end in itself, as it was with the Essenes; ii. 18, which shows them to have been given to angel worship, a cult which was perhaps more consonant with Essenism than with the practice of Judaizers, though this worship was also apparently accompanied by visions which were foreign to Essenism). 5. There are passages which seem to indicate the presence of Gnostic elements in these errors (e.g., ii. 2–9, which give us characteristic Gnostic terms such as "the *mystery* of God," "all the *fullness* of the Godhead," also ii. 10, which discloses the distinctive Gnostic idea of a graded series of supernatural beings, conceived of as emanations from God—"who is the head of all principalities and powers." This idea is repeated in verse 15—"having despoiled the principalities and powers"—and appears in various forms in the long passage i. 15–20, e.g., "the first-born of all creation"—"in Him were all things created, in the heavens and upon the earth, things visible and things invisible, whether thrones or dominions or principalities or powers"—"He is the head of the body, the Church, who is the beginning, the first-born from the dead," which latter passage, together with ii. 9–11, 15, 19, shows the significant emphasis placed by the Apostle upon the supremacy of Christ in both the physical and the spiritual worlds, and the absolute essentiality of union with Him in order to foster spiritual life and well-being. Such a full recognition of the supreme and sole mediatorship of Christ would serve to combat the Gnostic tendency to subordinate Him to the category of these angelic emanations, which seems to have been one of the most serious of the false teachings). 6. These errors, moreover, while vague and indeterminate, appear to have been set forth as mutually related, and to have been promulgated in a very dogmatic way (cf. ii. 4, 8, 18), being held forth as a mystery known only to the initiated (cf. Paul's counterassertion in ii. 2–3; iii. 3).

It would thus seem that these errors constituted a teaching of a more or less systematic kind, in which the underlying speculative principles were brought to bear upon the rule and

habit of life; that it was something more than mere Judaism, even Judaistic Judaism; that, in its main features, it was due to an attitude of mind somewhat similar to that which produced Essenism, and that it also possessed elements which appear in a more fully developed form in the Gnosticism of the second century. The great difficulty is in historically locating such a combination as is here presented to us.

In the effort to solve this problem it is to be remembered: (1) that, while these errors constituted a system of teaching, the system was not a fully developed one—at least Paul does not so treat it; (2) that Gnosticism was, in reality, an attempt to assimilate Christianity and philosophy, and that its philosophic element was a mystical rather than a logical one, so that we should be prepared to find the place of its beginnings in the East rather than the West; (3) that this attempt at assimilation was made on the principle of eclecticism, Gnosticism being, in fact, a combination of Jewish, Pagan, and Christian elements, the Jewish element being furnished by such types of thought as are seen in the Apocalyptic literature (e.g., in the Book of Enoch with its extensive angelology), and in certain of the doctrines of the Essenes, the Pagan by Hellenic philosophy and Oriental theosophy, the Christian by the evangelistic preaching; (4) that, as these Jewish speculative tendencies came in contact with Eastern speculation, they fermented, and this fermentation, going on within the Christian Church and in contact with Christianity, gave rise to Gnosticism.

Inasmuch, therefore, as this Epistle was sent to a church of the East, in the region where and at the time when the thoughtful Jew and the philosophic Greek and the theosophic Oriental were coming together—especially to this region of Phrygia, the home of one of the most mystical of the Pagan cults, that of Attis and Cybele, and whose Jewish population had been originally imported out of Babylon, from which place they may have brought with them an Oriental habit of Jewish thought—it would seem as though we had in these Colossian errors a specimen of just that process of fermentation which produced the beginnings of Gnosticism.

The attempt of Harnack and others to consider the Apostle as referring to parish difficulties of a purely practical nature, devoid of all speculative elements, results from a superficial exegesis which does not take the Epistle seriously.

COLOSSOCHELYS, kō-lŏs'sō-kĕ'lĭs (Neo-Lat., from Gk. κολοσσός, *kolossos*, colossus + χέλυς, *chelys*, tortoise). A gigantic fossil turtle found in the Pliocene deposits of India. See TURTLE.

COLOS'SUS (Lat., from Gk. Κολοσσός, *Kolossos*). A rare Greek word of unknown origin, used to denote a statue very greatly above the size of life. The English adjective colossal has a wider sense, denoting all statues which exceed the size of life. Innumerable colossi were raised in Egypt, mostly of the hardest stone, many of them 50 to 60 feet in height. Among the most celebrated are the two statues of Amenophis III. (See MEMNON.) It was in Greece that the most famous colossi appeared; e.g., three by Phidias—the bronze statue of Pallas Athene, on the Acropolis of Athens, the plume of whose helmet and the point of whose spear were landmarks to sailors between Sunium and Athens; another statue of the same goddess, of gold and ivory, in the Parthenon at Athens; and the Olympian Zeus, of the same material. Among the seven wonders of the Old World was reckoned the Colossus of Rhodes, representing Helios, the sun god, the national deity of the Rhodians, the work of Chares, of Lindus. It was erected by the Rhodians, at a cost of 300 talents, apparently as a thank offering after the successful defense of the city against Demetrius Poliorcetes. It is said to have been of bronze, cast in separate pieces, and to have occupied the artist 12 years. It was set up about 280 B.C., but 56 years later was overthrown by an earthquake, and lay in ruins until in 653 A.D. the Arabs captured the city and sold the metal to a Jewish merchant. The height was probably about 90 feet. The Hellenistic age seems to have taken delight in colossal statues and groups, and the Romans followed the Greeks. We hear of a statue of Jupiter on the Capitol made from the spoils of the Samnites, of such a size as to be visible from the Alban Hills. More celebrated was a Colossus of Nero, executed in marble, 110 or 120 feet high, from which the neighboring amphitheatre is believed to have derived the name of "Colosseum." At the death of Nero the head was changed to that of the sun god. The colossus was subsequently moved by Hadrian to make room for his temple of Venus and finally disappeared during the Middle Ages. Its later pedestal, discovered in 1828, may be seen between the Colosseum and the temple built by Hadrian. In modern times many colossal statues have

been set up. Especially celebrated are the "Bavaria," at Munich, the "Germania," at the Niederwald on the Rhine, the equestrian statue of Peter the Great in St. Petersburg, and the Bartholdi statue of "Liberty Enlightening the World" in New York harbor.

COLOS'TRUM (Lat.). A term applied to the first milk yielded after the birth of the young. It differs materially from ordinary milk in appearance and composition and is ordinarily considered unfit for consumption or manufacture. When examined under the microscope, it is found to contain, in addition to the ordinary fat globules of milk, peculiar aggregations of very minute fat granules, which are known as colostrum corpuscles or colostrum bodies, and which are probably the débris of the cells of the mammary gland. The chief chemical differences between colostrum and milk are a larger percentage of total solids and ash, a much greater proportion of albumin to casein, and less milk sugar. The fat differs somewhat in character from that of normal milk, containing considerable colesterine. Colostrum exerts a purgative effect upon the new-born infant and thus removes the meconium which has accumulated in the fetal intestine. Colostrum disappears as such within a few days after parturition, gradually assuming the characteristics of normal milk.

COL'PEO. A fox dog (*Canis magellanicus*) of Patagonia and Tierra del Fuego, larger, redder, and more wolflike than the other South American species. See FOX DOG.

COLPEPER, THOMAS. See CULPEPER, THOMAS.

COL'PORTAGE (from Fr. *colporter*, to carry on one's neck, from *col*, Lat. *collum*, neck + *porter*, Lat. *portare*, to carry). The distribution of religious publications, books, tracts, etc., by carriers called *colporteurs*.

COLQUHOUN, kô-hōōn', ARCHIBALD ROSS (1848–1914). An English traveler. He became associated with the Indian Department of Public Works in 1871. After acting as secretary of the British Commission to Siam, he in 1881–82 and 1883–84 made extensive tours of exploration in order to find a route for a railway between India and China. He became Administrator of Mashonaland in 1890, and in 1895 visited Central America as a representative of the Panama and Nicaragua canal projects. His travels are related in the various books he wrote, which include: *Across Chrysé* (2 vols., 1883); *The Opening of China* (1884); *English Policy in the Far East* (1885); *The Key of the Pacific* (1895); *China in Transformation* (1898); *Overland to China* (1901); *Greater America* (1904); *Mastery of the Pacific* (1904); *The Africander Land* (1906); *The Whirlpool of Europe; Austria-Hungary and the Hapsburgs* (with Mrs. Colquhoun, 1907); *From Dan to Beersheba—Reminiscences of Public Service* (1908); *Germany and Sea Power* (1909); *China in Reformation* (1912).

COLQUHOUN, JOHN (1805–85). A Scottish writer on sport. He was born at Edinburgh and was educated at the university in that city. In 1840 he recorded his manifold adventures as a sportsman in the extremely interesting and popular volume entitled *The Moor and the Loch*, with an autobiographical preface (4th ed., 1878). He is also author of: *Rocks and Rivers* (1849); *Salmon Casts and Stray Shots* (1858); *Sporting Days* (1866).

COLQUHOUN, PATRICK (1745–1820). An English police magistrate and writer, known for his efforts in behalf of administrative reform and the amelioration of the condition of the poor. He was born at Dumbarton and at an early age went to Virginia, where he became a successful merchant. Returning to Glasgow in 1766, he became a leader in public affairs, and in 1782 founded the Glasgow Chamber of Commerce, the oldest institution of its kind in Great Britain. He removed to London in 1789 and published there in 1795 his famous *Treatise on the Police of the Metropolis*, in which he advocated a complete reform of the police system of that city. Several of the recommendations made by him in the work, which passed through seven editions, were subsequently adopted. In consequence of the numerous important municipal reforms introduced by him, he was appointed magistrate at Westminster, London, in 1798. He published other treatises, including: *System of Education for the Laboring People* (1806); *On Indigence* (1806); *On the Population, Wealth, Power, and Resources of the British Empire* (1814; 2d ed., 1815).

COLQUHOUN, SIR PATRICK, or MAC CHOMBAICH DE (1815–91). An English lawyer. He was a great-grandson of Patrick Colquhoun (q.v.) and was educated at Westminster, Cambridge, and Heidelberg. While at Cambridge he became an expert oarsman, and in 1837 he won the Wingfield sculls, making him the amateur champion of England. He was for many years a member of the British diplomatic service, more particularly in Saxony, where he was Councilor of Legation until 1866. He also held the position of Chief Justice of the Supreme Court of the Ionian Islands while these were under British rule (1861–64). His principal work is a *Summary of the Roman Civil Law* (4 vols., 1849–54).

COL'QUITT, ALFRED HOLT (1824–94). An American soldier and politician, the son of Walter T. Colquitt (q.v.). He was born in Walton Co., Ga., graduated at Princeton in 1844, and was admitted to the bar in the following year. He volunteered for service in the United States army at the beginning of the Mexican War; was soon afterward appointed major, and served as an aid to General Taylor at the battle of Buena Vista. From 1853 to 1855 he was a prominent Democratic member of Congress, but at the expiration of his term declined a renomination; he was a member of the Georgia Legislature in 1859. On the approach of the Civil War he became an active secessionist and was a prominent member of the Georgia secession convention in 1861. He enlisted in the Confederate army early in 1861; quickly rose from the rank of captain to that of major general; was engaged in most of the operations in Virginia; distinguished himself at Antietam and Petersburg, and was engaged at the battle of Olustee, Fla., and the defense of Fort Fisher. After the war he was Governor of Georgia from 1876 to 1882 and was a member of the United States Senate from 1882 until his death.

COLQUITT, WALTER T. (1799–1855). An American lawyer and politician, born in Halifax Co., Va. He studied at Princeton, read law at Milledgeville, Ga., was called to the bar in 1820, and practiced with great success, first at Sparta and later at Columbus. He was circuit judge from 1826 to 1832. In 1834 and 1837 he was a member of the State Senate of Georgia, and from 1839 until his resignation in 1840 occupied a seat in the Federal House of Representatives. In 1842–43 he was again in Congress

and from 1843 until his resignation in 1848 was a United States Senator. He was originally a States-rights Whig, but became a Van Buren Democrat. During the Mexican War he was strongly opposed to the Wilmot Proviso (q.v.).

COLT, kōlt, Le Baron Bradford (1846–). An American jurist and legislator, born in Dedham, Mass. In 1868 he graduated from Yale College and in 1870 from the Columbia Law School. He spent a year in European travel, practiced law in Chicago and in Providence, R. I., and was a member of the General Assembly of Rhode Island from 1879 to 1881. In the latter year he was appointed United States district judge for Rhode Island by President Garfield, and three years later, by President Arthur, United States circuit judge for the first judicial circuit. He held this office until Jan. 21, 1913, when he was elected United States Senator for the term expiring 1919.

COLT, kōlt, Samuel (1814–62). An American manufacturer, inventor of the revolver. He was born in Hartford, Conn., where he worked in his father's factory. Obtaining a knowledge of chemistry, he lectured on that subject in the United States and Canada, and in 1835 secured patents for a revolving pistol, a wooden model of which he had made while at sea when a boy. In the same year the Patent Arms Company was formed for the manufacture of his invention, but became insolvent in 1842 through insufficient demand for its product. In 1847 Colt contracted to make 1000 weapons for General Taylor, and the improvement of the revolver, together with the increased demand for it, set the business on a stable footing, while new improvements were constantly made in the weapon. In 1852 he built a large armory in Hartford, where, besides firearms, machinery was made for their manufacture in other places, notably at the English and the Russian arsenals. He invented a battery for submarine harbor defense, and in 1843 laid and successfully tested in New York harbor the first submarine telegraph cable. His line was insulated with a combination of cotton yarn, beeswax, and asphaltum, incased in a lead pipe, gutta-percha not then having been discovered.

COLTMAN, Robert, Jr. (1862–). An American physician, born in Washington. He received his professional training at Jefferson Medical College, Philadelphia, and in 1881 began the practice of medicine. In 1896 he was appointed professor of anatomy at the Tung Wen College, Peking, and in 1898 professor of surgery at the Imperial University, Peking. During the siege of Peking by the Boxers in 1900 he sent out the first message that reached the outside world, acting as correspondent for the *Chicago Record.* He became attorney for the Standard Oil Company at Tientsin, China. He is author of *The Chinese, their Present and Future: Medical, Political and Social* (1891) and *Yellow Crime, or Beleaguered in Peking* (1901).

COLTON, kōl'ton. A city in San Bernardino Co., Cal., 58 miles east of Los Angeles, on the Atchison, Topeka, and Santa Fe, the Southern Pacific, and the San Pedro, Los Angeles, and Salt Lake railroads (Map: California, H 8). It is an important shipping centre for fruit and vegetables, has railroad-car shops, large precooling plants, canneries and packing houses, cement works, flour mills, and fertilizer plants. The water works and electric-light plant are owned by the city. Pop., 1900, 1285; 1910, 3980.

COLTON, Arthur (Willis) (1868–). An American writer of stories, born at Washington, Conn. He was educated at Yale University (A.B., 1890; Ph.D., 1893) and was instructor in English there in 1893–95. In 1906 he became librarian of the University Club, New York City. Besides his contributions to *Harper's, Scribner's, Collier's,* and the *Atlantic Monthly,* he is author of *Bennie Ben Cree* (1900); *The Delectable Mountains* (1901); *The Debatable Land* (1901); *Tioba* (1903); *The Belted Seas* (1905); *The Cruise of the Violetta* (1906); *Harps Hung Up in Babylon,* poems (1907).

COLTON, Charles Henry (1848–1915). An American Roman Catholic bishop, born in New York City. He was educated at St. Francis Xavier College and at St. Joseph's Seminary, Troy, N. Y. Ordained a priest, he was assistant (1876–86) and pastor (1886–1903) at St. Stephen's Church, New York City. After 1896 he was also chancellor of the archdiocese of New York until 1903, when he was consecrated Bishop of Buffalo. He is author of *Seedlings* (1906); *My Trip to the Holy Land* (1906); *Buds and Blossoms* (1910).

COLTON, George Radcliffe (1865–1916). An American public official, born at Galesburg, Ill. He was educated at Knox College. He was a ranchman in New Mexico in 1881–86, a member of the Nebraska House of Representatives in 1889–90, and a national bank examiner for the District of Nebraska in 1897. As lieutenant colonel of the First Nebraska Volunteer Infantry he went to the Philippine Islands, where he remained, upon the American occupation, to organize the Manila customs service. In 1905 he undertook a similar task in Santo Domingo. He was insular collector of customs in the Philippines from 1907 to 1909, and then became Governor of Porto Rico. The new tariff bill for the Philippines, enacted by Congress in 1909, was drafted by him.

COLTON, kōl'ton, Walter (1797–1851). An American writer. He was born in Rutland, Vt., graduated at Yale and Andover, and for several years was professor of moral philosophy and belles-lettres in the Middletown (Connecticut) Academy. In 1831 he became chaplain in the navy. He was made alcalde of Monterey, Cal., in 1845, and founded the *Californian,* the first newspaper published in that State. He also built the first schoolhouse and made the first announcement of the discovery of gold. Colton edited newspapers in Washington, Charlestown, Mass., and Philadelphia, and published *Ship and Shore in Madeira, Lisbon, and the Mediterranean* (1835); *A Visit to Athens and Constantinople* (1836); *Three Years in California* (1850); *Deck and Port* (1850); *The Sea and Sailor* (1851).

COLTS'FOOT'. See Tussilago.

COLU'BRIDÆ (Neo-Lat. nom. pl., from Lat. *coluber,* serpent). The largest and most scattered family or group of snakes. It is variously limited by systematic authors and has served as a residuary group for all serpents not easily classified elsewhere, so that a definition is difficult. The group, however, may be said to include the "common" small, harmless serpents everywhere. The garter snakes, water snakes, hognose, etc., are North American representatives of this family, to which, indeed, all nonvenomous American snakes belong except a few species along the Mexican border.

COLUGO, kō-lōō'gō, or Kaguan. See Cobego.

COLUMBA. See Calumba.

COLUM'BA, Saint, Saint Colum-cille, or Saint Colm (521–597). An Irish missionary, one of the greatest names in the early ecclesiastical history of the British Isles. He was born at Gartan, County Donegal, northwest Ireland, Dec. 7, 521. His father was Fedhlmidh, of the powerful Clan O'Donnell, and related to several of the rulers of Ireland and west Scotland; his mother was Eithne, who also boasted royal ancestry. He studied first at Moville, County Down, 5 miles south of Bangor, on Belfast Lough, under Bishop St. Finnian, and was ordained deacon by him; next under another St. Finnian, at Clonard, who ordained him a priest. He was early distinguished by his piety, and the name Columba, i.e., 'dove,' was recognized as an appropriate one. He showed rare monastic zeal. In 545 he founded the church and monastery of Derry, and in 553 those of Durrow, not far west of Dublin. The latter became of great importance and in both places the saint is still commemorated by a well and a stone. He founded other monasteries, the chief of which was Kells. In 561 he embroiled himself in the civil strifes of his country and was charged with having incited the bloody battle of Culdreimhne (now Cooladrummon), because he appealed to his tribe to defend by force of arms the copy of the Latin Psalter which he had made from one borrowed of his old teacher, St. Finnian of Moville. Legend says that for this he was required to do penance by foreign missionary labor. In 563 he headed a little company of 12 disciples and sailed across to the west coast of Scotland, and landed upon the little island of Hy, since called I-colum-cille, but better known as Iona. There he began the great work of converting the Picts, to which he owes his fame. His missionary operations were probably very simple, consisting of persistent personal appeals. In the legends which are told about him, as in the life of him by Adamnan and in the *Book of Deer*, a Celtic manuscript of the eleventh or twelfth century, preserved at Cambridge, England, edited by John Stuart for the Spalding Club (Aberdeen, 1869), many miraculous occurrences are narrated. He promoted monasticism, overcame the opposition of the Druids, made many converts, including royal personages, and founded many churches. As in Ireland, so in Scotland, he took part in secular affairs. He died at Iona at midnight between June 8 and 9, 597. With loving care his bones were enshrined, and his relics—the stone pillow on which he slept, the books he loved so well, the staff which was the symbol of his pastoral authority, and other objects which he had used—were long preserved and exhibited. Columba was a poet, and three Latin hymns now extant are attributed to him. In one of them, the "Altus Prosator," published with an English paraphrase, by John, Marquis of Bute (Edinburgh, 1872), each strophe begins with a different letter, in alphabetical order. Besides these, some Celtic poems were attributed to him, and a Rule (printed in Celtic and English in Haddon and Stubbs, *Councils and Ecclesiastical Documents*, vol. ii, p. 119, and in English only in Skene, *Celtic Scotland*, vol. ii. p. 508).

Columba, while he was an ascetic, was an eager student and made copies with his own hand of documents which fell in his way. Two of these—the *Book of Kells* and the *Book of Durrow*—were long preserved. His energy sometimes led him to harsh actions, but that he was tender-hearted the affection of his monks evinces. He seems to have had original ideas upon church government; for Bede writes of Iona that its ruler was "an abbot, who is a priest, to whose direction all the province, and even the bishops, contrary to the usual method, are subject, according to the example of their first teacher [Columba], who was not a bishop, but a priest and a monk" (*Eccles. Hist.*, vol. iii, p. 4). Bede then criticizes the Columban monks because they did not, until 715, keep Easter after the Western manner, but upon the 14th of Nisan, or whatever day it came, as the Eastern church did. Their religious services were numerous, but the rest of their time was spent in labor, either in working upon their fields and tending cattle (for they raised what they needed for their support), or in copying books, particularly the Bible, or in studying or in teaching others. Latin was spoken as well as Celtic and was employed by them in writing. Some of the monastic communities contained famous schools. The continuance of the memory of St. Columba in Scotland is shown by the fact that his is one of the commonest names given to a church, even to-day, among the Presbyterians. The life of St. Columba was written by two of his successors in the abbacy of Iona—Cuimine Ailbhe, seventh abbot (657–669), whose *De Virtutibus Sancti Columbæ* (printed by Pinkerton, London, 1789; Paisley, 1889) was incorporated in the *Vita Sancti Columbæ* of Adamnan, the ninth abbot (679–704). But both these writers are concerned not so much with the life as with the prophecies, miracles, and other unusual phenomena which were ascribed to their subject, and so the amount of real biographical facts is very small. This life by St. Adamnan is, however, one of the best of the mediæval lives of saints. It has been edited in a very superior manner, first by W. Reeves (Dublin, 1857), and again upon Reeves's edition by J. T. Fowler (Latin text and English notes, Oxford, 1894; Eng. trans. of the text, 1895). There is a more recent English translation by Wentworth Huysche (London, 1906). Consult also Chevalier, *Repertoire des sources historiques* (q.v.) (Paris, 1905); Macgregor, *Stories of Three Saints* (New York, 1908); Leahey, *Columbanus, the Celt* (Philadelphia, 1913); Troup, *St. Columba; the Lord's Song in a Strange Land* (London, 1913).

COLUM'BÆ (Lat. nom. pl. of *columba*, dove), or **COLUM'BIFOR'MES.** An order of birds, containing the pigeons (Columbidæ and allied families) and the dodos (Didiidæ). See Dodo; Dove; Pigeon.

COLUM'BAN, or COL'UMBA'NUS, Saint (543–615). One of the most learned and eloquent of the many missionaries whom Ireland sent to the Continent during the Dark Ages. He was born in Leinster. Having studied under St. Congall, in the great monastery of Bangor, in Ulster, he passed over to France, accompanied by 12 companions (c.585), and in Austrasia and Burgundy, near the southern extremity of the Vosges Mountains, founded the monasteries of Anegray, Luxeuil, and Fontaine. His adherence to the Irish rule for calculating Easter involved him in controversy with the French bishops about 603; and a few years later the courage with which he rebuked the vices of the Burgundian court led to his expulsion from France. Passing through Switzer-

land into Lombardy, he founded, in 612, the famous monastery of Bobbio, in the Apennines, where he died on Nov. 21, 615. The writings of St. Columban, which are wholly in Latin, consist of a rule for the government of his monastery, a few poems, several letters on ecclesiastical affairs, and 16 short sermons. His monastic rule has been printed more than once; but the most complete edition of his works is in Patrick Fleming's *Collectanea Sacra*, published at Augsburg in 1621 and at Louvain in 1667. It is reprinted in Migne, *Patrol. Latina*, lxxx. Of the sermons of St. Columban, M. Guizot remarks that "the flights of imagination, the pious transports, the rigorous application of principles, the warfare declared against all vain or hypocritical compromise, give to the words of the preacher that passionate authority which may not always and surely reform the soul of his hearers, but which dominates over them, and, for some time at least, exercises paramount sway over their conduct and their life." The town of San Colombano, in Lombardy, takes its name from the Irish monk, as the town and Canton of St. Gall (q.v.), in Switzerland, perpetuate the name of the most favored of his disciples. For his life, consult: Jonas, who was almost a contemporary and one of his successors as the abbot of Bobbio, in Migne, *Patrologiæ Cursus Completus* (Paris, 1857–60); Besser (Leipzig, 1857); Zimmermann (St. Gall, 1865); Bispham (New York, 1904); and for other reference works, see Chevalier, *Repertoire des sources historiques* (Paris, 1905).

COL'UMBA'RIUM (Lat., dovecote, from *columba*, dove). From a fancied resemblance to a dovecote, the name given to the rows of niches in the walls of sepulchral chambers in Roman burial places, to receive the little urns or sarcophagi of marble or terra cotta containing the ashes of the deceased; finally, to the sepulchral chamber itself. Tombs of this description were chiefly used by the poorer classes who could not afford separate tombs, and were erected by great families for their slaves and dependents, or by funeral associations or corporations under the Empire. Several perfect examples have been found near Rome; among them, those of the Vigna Codini, at the Licinian Gardens. Others exist at Naples and elsewhere in Italy. The *ustrina*, or places for incinerating the bodies, were attached to the columbaria. In recent times the term "columbarium" has been applied to a room or hall connected with a crematory and provided with niches for the cinerary urns.

COLUM'BA'S ISLE. The poetic name for the island of Iona, on the western coast of Scotland, where St. Columba, "The Apostle of Caledonia," founded a monastery about 565 and was buried in 597.

COLUM'BIA (Neo-Lat., from *Columbus*). The name under which the United States is usually personified.

COLUMBIA. A name formerly applied to the region, west of the Rocky Mountains, embracing British Columbia and the States of Washington and Oregon.

COLUMBIA. A city and the county seat of Boone Co., Mo., 146 miles by rail west-northwest of St. Louis, on the Wabash and the Missouri, Kansas, and Texas railroads (Map: Missouri, D 3). It is the seat of the University of Missouri (State), opened in 1841; of institutions for women, Christian College (Christian), established in 1851, Bible College, and Stephens College (Baptist), founded in 1856, and two academies. The library of the State Historical Society is in one of the State university buildings. A monument to Thomas Jefferson, originally erected in Monticello, Va., is now set up here. The city contains a United States government weather station and the Parker Memorial Hospital. Columbia has flouring and planing mills, elevators, packing plant, and a shoe factory; also farming, fruit-growing, and stock-raising interests. Settled in 1820, Columbia is governed by a mayor, elected biennially, and a council. The water works and light plant are owned by the city. Pop., 1890, 4000; 1900, 5651; 1910, 9662; 1920, 10,379.

COLUMBIA. A borough in Lancaster Co., Pa., 28 miles southeast of Harrisburg; on the Susquehanna River, here more than a mile wide, and on the Pennsylvania and the Philadelphia and Reading railroads (Map: Pennsylvania, J 7). The borough is situated in one of the most fertile tobacco regions in the country. It is an important industrial centre, its manufactures including boilers and engines, iron, laundry machinery, silk, lace, shirts, wagons, brushes, flour, novelties, malt liquors, stoves, etc. Wrightsville, on the west bank of the river, is connected with the borough by one of the longest bridges in the United States. The place was founded in 1726 by English Quakers from Chester County and was for many years called Wright's Ferry. In 1789 it was proposed to locate the capital of the United States here. In June, 1863, the original bridge was burned to prevent the Confederate troops from marching on Philadelphia. Pop., 1890, 10,199; 1900, 12,316; 1910, 11,454; 1920, 10,836.

COLUMBIA. The capital of South Carolina, and the county seat of Richland County; on the east bank of the Congaree River below the junction of the Broad and Saluda rivers, 82 miles by rail northeast of Augusta, Ga., and 129 miles by rail northwest of Charleston; on the Southern, the Atlantic Coast Line, the Columbia, Newberry, and Laurens, and the Seaboard Air Line railroads (Map: South Carolina, D 3). Columbia is at the head of steam navigation on the river and is on the Columbia Canal, which furnishes abundant water power (13,000 horse power). The city is laid out attractively, with streets well shaded and crossing at right angles. Among the notable buildings are the Capitol, courthouse, city hall, post office, the State insane asylum, and the State penitentiary. The city contains also a municipal hospital, a public library, and the Baptist Church in which the secession ordinance convention was held. The educational institutions include the University of South Carolina, opened in 1805; Presbyterian Theological Seminary; Columbia Female College (Methodist Episcopal, South), opened in 1859; College for Women (Presbyterian), opened in 1890; Lutheran Seminary; Allen University (African Methodist Episcopal), opened in 1881; and Benedict College (Baptist), opened in 1871, for colored students. Columbia has extensive manufacturing interests, principally in cotton and fertilizers; and there are also sash and door factories, iron works, foundries, machine shops, etc. The commission form of government was adopted in May, 1910. Pop., 1900, 21,108; 1910, 26,319; 1914 (est., including suburbs annexed), 60,000; 1920, 37,524.

In response to a demand for a more central place of government than Charleston, the Legislature of South Carolina in 1786 ordered Columbia to be laid out, and in January, 1790, it met there for the first time. On Feb. 17, 1865, General Sherman, at the head of the Union army, entered Columbia, and that night a fire started which lasted an entire day and destroyed three-fifths of the city, including the old statehouse and its library of 25,000 volumes, a convent, several churches, the railroad depot, and much cotton. After the war Columbia rapidly recovered its prosperity.

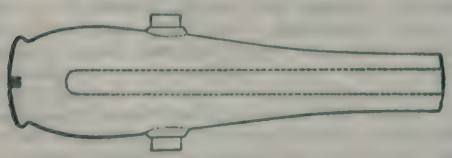
COLUMBIA. A city and the county seat of Maury Co., Tenn., 49 miles by rail south by west of Nashville, on Duck River, and on the Louisville and Nashville, the Nashville, Chattanooga, and St. Louis, and the Nashville, Florence, and Sheffield railroads (Map: Tennessee, D 3). The courthouse, a well-equipped military academy, library, hospital, and the Columbia Institute for young ladies are noteworthy features. Columbia is the centre of a fertile agricultural region and an important grain and live-stock market. It controls large phosphate interests and has cotton, corn, and flouring mills, pump factory, lumber and planing mills, marble works, machine shops, garter factory, etc. Settled in 1811, Columbia was first incorporated in 1822. It is governed under a revised charter of 1903, which provides for a mayor elected every two years and a council elected by wards. Pop., 1890, 5370; 1910, 5574.

COLUMBIA, British. See British Columbia.

COLUMBIA, District of. See District of Columbia.

COLUMBIA CITY. A city and the county seat of Whitley Co., Ind., about 100 miles (direct) north-northeast of Indianapolis; on the Vandalia and the Pittsburgh, Fort Wayne, and Chicago railroads (Map: Indiana, D 1). It has a fine courthouse and manufactures furniture, wagons, etc. There are also important live-stock interests. The water works, sewage system, and electric-light plant are owned by the city. Pop., 1890, 3027; 1900, 2975; 1910, 3448.

COLUM'BIAD. A heavy muzzle-loading cast gun, invented by Colonel Bomford and improved by Colonel Rodman, and combining some of the features of the gun, howitzer, and mortar, answering in this respect to the modern



COLUMBIAD.

breech-loading rifled mortar or howitzer. It appeared early in the nineteenth century and was in use until after the War of the Rebellion. See Artillery; also Ballistics; Guns, Naval; Ordnance.

COLUMBIAD, The. A lengthy poem, by Joel Barlow (1807), enlarged from his previous *Vision of Columbus* (1787) and incorporating also some of his other poems.

COLUMBIA INDIANS. A term sometimes applied to all the Indians of Oregon and Washington, but specifically the name of a Salishan (q.v.) tribe, the Sinkiuse.

COLUM'BIAN EXPOSITION. See World's Columbian Exposition.

COLUMBIA, or OR'EGON, RIVER. One of the largest rivers of North America. It rises in the eastern division of the Kootenai district in British Columbia, in about lat. 50° N. and long. 116° W. (Map: Washington, E 4). It flows at first northwest as far as lat. 52° and then turns sharply on itself and flows southward through a series of narrow lakes, crossing the international boundary line near the northeast corner of Washington. Just before crossing the boundary, it is joined by the Pend Oreille River (Clark's River or Fork), a large branch from the east, which by some geographers is considered a part rather than a branch of the main stream. In Washington it flows in a winding course, at first south (to a little beyond its junction with Spokane River), then west, then south, and then southeast to the Oregon line in about long. 119° W. Near the Oregon boundary it is joined by its largest branch, Snake River, which rises in Yellowstone Park. Below the point of junction the river flows in a westerly direction, forming the boundary between Oregon and Washington over the remaining distance to the Pacific, being joined on its way by the John Day, Deschutes, and Willamette rivers from the south. Its headwaters drain the Rocky Mountain region on the west from about lat. 54° N. to about lat. 42° N. Its length is 1300 to 1400 miles. Its total drainage area (including its tributaries) is about 259,000 square miles, of which about 48,000 square miles lie in Washington, 55,370 in Oregon, 81,380 in Idaho, 25,000 in Montana, and 38,700 in British Columbia, the remainder (10,550 square miles) being about equally divided between Nevada and Wyoming. Its flood discharge at The Dalles, Oregon, is estimated at 1,000,000 second feet, and the low-water flow at 40,000 second feet. The river is broken by falls and rapids into many separate portions; the first navigable reach is that from its mouth to the Cascades (160 miles) around which are built a canal and a portage railroad. About 50 miles above the Cascades are The Dalles, a series of falls and rapids extending over 12 miles to Celilo. From Celilo, 13 miles above The Dalles, it is navigable to Priest Rapids, 198 miles, and for several shorter stretches farther up, the total navigable length amounting to 756 miles. The total navigable mileage of the Columbia and its branches is 2132 miles. The important city of Vancouver, Wash., is built on its northern bank, just above the entrance of the Willamette, and Astoria, Oreg., is situated at the mouth of the river. The value of the river as a waterway is lessened by the fact that the entrance to its mouth is obstructed by a bar. Large vessels, however, ascend the Columbia to Vancouver, and also the Willamette to Portland. The tide ascends to the cascades about 150 miles from the sea, which are overcome by vessels through a lock constructed by the United States government. (See Jetty.) Its mouth forms the only fresh-water harbor on the Pacific coast, and the only deep-water harbor between Cape Flattery and San Francisco, a distance of 700 miles. The Columbia is famous for its salmon fisheries. This great river was long vaguely believed to exist. Its mouth was discovered only in 1792, by Captain Gray, of Boston, Mass., who gave it the name of his own vessel in place of the name "Oregon." It was partly explored by Lewis and Clark in 1804–05.

COLUMBIA SALMON. See QUINNAT.

COLUMBIA SERIES. In geology the accumulations of sands, gravels, and clays that are found along the Atlantic and Gulf Coastal Plain of the United States and that constitute the surface deposits, of later age than the Tertiary strata, within the area of their occurrence. They are equivalent in time with the Glacial deposits of the Northern States, but of course are of different origin, as the ice sheet did not extend farther south than northern Pennsylvania. The series is divisible into two or three phases, each represented by terraced beds along the stream valleys and coast, the higher and older terraces being more remote from the sea. There are very few fossils in the beds, and it is believed that the series in general is the work of streams and subaërial agencies rather than of marine deposition.

COLUMBIA UNIVERSITY. One of the most important educational institutions in the United States. Save for a few years during the Revolution, it has carried on its work in the city of New York since the middle of the eighteenth century and has always been identified closely with the development of the city and the State. It was the college of Alexander Hamilton, John Jay, Robert R. Livingston, De Witt Clinton, Hamilton Fish, and Abram S. Hewitt.

Since the beginning of the eighteenth century the idea of a college in the Province of New York had been discussed among the citizens, and when, in 1754, a fund of about £3500 had been obtained mainly through public lotteries, a royal charter for King's College was obtained from George II, and in the following year Trinity Church gave a plot of land on what is now Murray Street and West Broadway. The work of instruction began with the scholarly Dr. Samuel Johnson, as president and sole instructor, and eight students. The first Commencement was held on June 21, 1758. The first college building, erected on a portion of the King Farm, at what is now the corner of Park Place and Church Street, was completed in 1760. A Medical Department was founded in 1767 under Myles Cooper, the successor of President Johnson. In 1776 the buildings were seized by the Committee of Safety, and exercises were practically suspended until 1784, when the institution reopened as Columbia College, first under the regents of the State of New York, and from 1787 on under its own board of trustees (see infra). The new president was William Samuel Johnson. He was a son of the first president of King's College, one of the framers of the Constitution, and United States Senator from Connecticut.

Although the professors were many of them men of distinction, including Samuel L. Mitchill, later United States Senator, and Chancellor James Kent, the author of the famous Commentaries, the college was greatly hampered by poverty, and until past the middle of the nineteenth century its growth was slow. In 1849, however, came the appointment of the first of a series of four notable presidents —Charles King, Frederick A. P. Barnard, Seth Low, and Nicholas Murray Butler. Under President King, in 1857, came the moving of the college to Madison Avenue and Forty-ninth Street, the establishment of a Law School in 1858, and of a School of Mines in 1864. In 1860 came a formal union with the College of Physicians and Surgeons (founded in 1807).

Under President Barnard, who succeeded President King in 1864, the institution grew rapidly. The growth of the city had greatly increased the income from the two main endowments of the institution—the gift of land from Trinity Church and the gift from the State Legislature, in 1814, of the Hosack Botanical Garden, now bounded by Forty-seventh and Fifty-first streets and Fifth and Sixth avenues. In 1880 came the establishment of the School of Political Science; in 1881, of a Department of Architecture; and during the same decade the development of courses in civil engineering, applied chemistry, and electrical engineering. One of the most important results of Barnard's presidency was the movement to provide for the higher education of women, which resulted in the establishment, in 1889, of Barnard College, and the opening of postgraduate studies to women on equal terms with men. President Barnard died in 1889, and his successor was Seth Low, of the class of 1870, formerly mayor of Brooklyn and, after his resignation as president, mayor of the city of New York. During his presidency the several flourishing but loosely connected schools were consolidated into a single organism. In 1890 a representative University Council was formed, and in the same year the School of Philosophy was established. The College of Physicians and Surgeons surrendered its charter and became an integral part of Columbia in 1891, and in 1892 the School of Pure Science was established.

In 1896 the trustees authorized the use of the title "Columbia University," the term "Columbia College" being reserved for the undergraduate courses for men. In 1897 the institution moved to a new site on Morningside Heights, where the first five of a group of academic buildings had been erected, the central one being a Library building given by Mr. Low as a memorial of his father. In 1900 Teachers College, founded in 1888, and Barnard College, while retaining their separate corporate existences, became integral parts of the educational system of the university, and in the same year a Summer Session was established.

On President Low's resignation in 1901, Nicholas Murray Butler, a graduate of the class of 1882, professor of philosophy and education and dean of the Faculty of Philosophy, was elected to succeed him. In 1903 the growth of the university made necessary the purchase of eight additional acres to the south of the original site, and in the same year Joseph Pulitzer made a gift of $1,000,000 to establish a School of Journalism, which was ultimately founded in 1912. In 1904 the work in extension teaching, which had been developing under the auspices of Teachers College, was formally made a part of the work of the university, and in the same year the New York College of Pharmacy, founded in 1829, became a professional school with the same relations to the university as those of Barnard College and Teachers College. The one hundred and fiftieth anniversary of the founding of King's College was celebrated in October, 1904, and included the laying of the corner stones of four new academic buildings. In the following year two of these buildings, with accommodations for 500 men, were opened as university residence halls.

During the first years of President Butler's administration careful consideration had been given to the place of undergraduate collegiate instruction in the university and its relation to professional training, and in 1905 a new programme of studies was adopted in Columbia College and Barnard College, which is so arranged as to make it possible for a properly qualified student to complete the requirements both for the B.A. and for the professional degrees of the university in six years. In 1906 came the formal establishment of the Faculty of Fine Arts, with schools of Architecture, Music, and Design. During the same year an interchange of professorships was effected with the German government. In 1911 a similar arrangement was made with France, and in 1913 with Austria.

Columbia University in 1913 comprised the following: *Undergraduate colleges:* Columbia College, with 877 students, and Barnard College (q.v.), with 618 students, each offering courses leading to the degrees of B.A. and B.S. *Professional schools:* School of Law, with 478 students, offering courses based upon at least three years of collegiate work and leading to the degree of B.C.L.; the College of Physicians and Surgeons, with 344 students, offering a four-year course leading to the degree of M.D.; the schools of Mining, Engineering, and Chemistry, with 669 students, offering courses of four years each and leading to the degrees of E.M., Met.E., C.E., E.E., Mech.E., Chemist, and Chem.E.; the School of Journalism, with 76 students, offering a four-year course in letters, science, and practical journalism leading to the degree of Bachelor of Literature; Teachers College (q.v.), with 1684 students, offering courses open to men and women, leading to the degree of B.S. and to the several diplomas in teaching; the Faculty of Fine Arts, with 157 students, offering courses leading to degrees and certificates in architecture, music, and design; the New York College of Pharmacy, with 414 students, offering university courses leading to the degrees of Pharmaceutical Chemist, Bachelor of Science in pharmacy, and Doctor of Pharmacy. *The nonprofessional graduate schools* of Political Science, Philosophy, and Pure Science, with 1570 students, offer advanced courses and opportunities for research, leading to the degrees of A.M. and Ph.D., in philosophy and education, psychology and anthropology; ancient and modern languages and literatures; history, economics, and public law; the mathematical, physical, chemical, biological, and geological sciences; mining, metallurgy, and engineering (civil, electrical, mechanical, sanitary, and chemical). The Summer Session of six weeks' duration, with 4539 students in 1913, and the system of Extension Teaching, with 1828 students, offer additional opportunities to those who cannot attend the regular courses of instruction. The teaching staff of the university, exclusive of administrative and emeritus officers, numbers 706.

Women are admitted as undergraduates at Barnard College, as professional students at Teachers' College and at the College of Pharmacy, as graduate students by the faculties of Philosophy, Political Science, and Pure Science, and to the Summer Session and Extension courses. They are not admitted to the schools of Law, Medicine, Applied Science, or Architecture.

The title to all property in the central corporation (The Trustees of Columbia College in the City of New York) is vested in a board of 24 trustees, whose term of office is for life and who form a self-perpetuating body, appointing all officers of instruction and administration and having general oversight and control of the affairs of the university. In 1909 provision was made for the nomination by the alumni of six of the 24 trustees. The president has charge of the educational administration and is chairman of the University Council and of every faculty. The deans, under the general supervision of the president, have immediate charge of the work of the several faculties. The University Council, a representative body consisting of the president and the dean and one elected member from each faculty, has immediate charge of the regulations for the higher degrees, the appointment of university fellows and scholars, and the correlation of courses. It has also the power to make recommendations concerning the educational administration of the university and to advise the president upon matters of general policy. The professors and other officers of instruction are divided among 58 departments, grouped into 14 divisions.

The total assets of the university exceed $50,000,000 in grounds, buildings, and invested funds. The budget of 1913 amounted to $2,367,269.33, and the income for the previous year to $2,038,354.22.

The University Library numbers about 500,000 bound volumes, including the Avery Architectural Library and the Phœnix collection. A number of learned societies make it the depository of their collections. The numerous laboratories and museums of the university are all well equipped. See Plate of NEW YORK.

The buildings of the Corporation of Columbia University at Morningside Heights include, besides the central Library, the following: Havemeyer Hall, given by the family of Frederick Christian Havemeyer and used for chemistry; Fayerweather, for physics and astronomy; Schermerhorn, given by William C. Schermerhorn and used for the other natural sciences; Engineering; School of Mines, given by Adolph Lewisohn for mining and metallurgy; Hamilton, given by John Stewart Kennedy for Columbia College; Journalism, provided by the gift and bequest of Joseph Pulitzer for the purpose of the School of Journalism; Avery, the gift of Samuel B. Avery, containing the Avery Architectural Library and the School of Architecture; Earl, given by William E. Dodge as a building for the students; St. Paul's Chapel, the gift of Olivia E. P. Stokes and Caroline Phelps Stokes, one of the most beautiful ecclesiastical interiors in New York, with windows by John La Farge; and University (unfinished). The resident halls are: Hartley, a memorial to the late Marcellus Hartley, given by his daughter and grandson; Furnald, given by the family of Royal B. Furnald, a member of the class of 1901; and Livingston. On the extreme east of the group are the Crocker Research Laboratory and the residence of the president of the university; and in the neighboring West One Hundred and Seventeenth Street the Deutsches Haus, the gift of Edward D. Adams, and the Maison Française, the gift of A. Barton Hepburn, centres respectively of German and French interests.

The buildings of Barnard College are immediately to the west, and those of Teachers College

to the north, of the university site. The Medical School is on Fifty-ninth Street, between Ninth and Tenth avenues, and the College of Pharmacy in West Sixty-eighth Street. The entire university occupies more than 34 acres of ground in New York City, and has, in addition, a Summer Camp of Surveying and Geodesy, covering 500 acres, in Morris, Conn.

The university is intimately connected with the other educational enterprises of the city. The head of the Union Theological Seminary and of the General Theological Seminary are nonvoting members of the University Council, and the directors of the American Museum of Natural History, the Metropolitan Museum of Art, and the president of the National Academy of Design are members of one or another of the Columbia faculties. Columbia professors deliver lectures at these museums and at Cooper Union and conduct courses in special investigation at the Botanical and Zoölogical gardens. The university makes annual provision for more than 200 fellows and scholars, whose stipends range from $150 to $1500. In the academic year 1912–13, $120,279 was earned by self-supporting students. Under the auspices of the Columbia University Press, established in 1903, has appeared a notable series of scholarly volumes, 172 in all. The *Columbia University Quarterly*, the *Political Sciences Quarterly*, the *School of Mines Quarterly*, and, in addition, 21 departmental series and 13 journals are issued under the editorial direction of university officers, and 20 more with their coöperation. There are also 10 student publications. Consult: *A History of Columbia University, 1754–1904* (New York, 1904); Nelson, *Columbiana: A Bibliography* (ib., 1904); *An Official Guide to Columbia University* (ib., 1912).

COLUMBIAN UNIVERSITY. See GEORGE WASHINGTON UNIVERSITY.

COL'UMBINE (Fr., It. *Columbina*, from Lat. *columbinus*, dovelike, from *columba*, dove). 1. A conventional character in old Italian comedy and the pantomime, first appearing about 1560. She was the daughter of Pantaloon and the object of Harlequin's adoration and so appears in English pantomime. See PANTOMIME. 2. A wild flower, emblematic of forsaken lovers in old English verse.

> "The columbine in tawny often taken,
> Is then ascribed to such as are forsaken."
> Browne's *British Pastorals*, 1613.

COLUM'BITE. An iron and manganese niobate which passes chemically by such insensible gradations into the mineral tantalite, an iron tantalate, that it is impossible to separate the two mineral species. The iron and manganese vary widely, and tin and tungsten are also often present in small amounts. Columbite crystallizes in the orthorhombic system. It has a bluish iridescence and is of an iron-black, grayish, or brownish color. This mineral occurs in granitic and feldspathic veins in the form of crystals, crystalline granules, and cleavable masses. It is found at various localities in Bavaria, Italy, Finland, Greenland, and in the Ural region; in the United States it is found in greater or less abundance in nearly all of the States bordering along the Appalachian Mountain system, in the Black Hills of South Dakota, and in California and Colorado. It has some slight economic value for the preparation of salts of niobium and tantalum, but as only small quantities of these salts are used, the mineral is in but little demand. It is interesting to mention that the first occurrence of columbite in America was made known from a specimen sent by Governor Winthrop of Connecticut to Sir Hans Sloane, then president of the Royal Society of Great Britain.

COLUM'BIUM (Neo-Lat., from *Columbia*, United States of America), or NIOBIUM. A metallic element discovered by Rose in 1846. It is found in the minerals columbite, from Haddam and Middletown, Conn., and tantalite, from near Falun and elsewhere in Sweden; also in small quantities in other minerals. In order to obtain the element the mineral is fused with acid potassium sulphate; the resulting mass, which is washed and boiled with concentrated hydrochloric acid, yields the hydroxide, which is then reduced. However, the purest metallic columbium that has yet been obtained still contained nearly 0.3 per cent of hydrogen. A metallic columbium containing about 3 per cent of carbon was obtained in 1901 by Moissan, by heating in the electric furnace a mixture of 82 parts of columbic acid and 18 parts of pure carbon. The product did not melt in the oxy-hydrogen flame and was hard enough to scratch quartz readily. Columbium (symbol Cb or Nb, atomic weight 93.5) is a steel-gray powder with a specific gravity of 7.06 at 15° C. It forms three oxides with oxygen, of which the pentoxide, Cb_2O_5, forms salts called *columbates* or *niobates*.

COLUM'BUS. A city and the county seat of Muscogee Co., Ga., 95 miles (direct) south-southwest of Atlanta, at the head of navigation on the Chattahoochee River and on the Central of Georgia, the Southern, and the Seaboard Air Line railroads (Map: Georgia, B 3). Steamboats ply between Columbus and Apalachicola, Fla. The city, from its important manufactures called the "Lowell of the South," is also the centre of a fertile agricultural region, and has vast water power, the river having at that place a fall of 120 feet in three miles, developing 67,000 horse power. The trade with adjoining States is extensive. Columbus receives annually 350,000 bales of cotton, 100,000 bales of which are used in its manufactures of cotton goods. It has foundries and machine shops, cottonseed-oil mills, refineries, barrel factories, and manufactories of caskets, bank and show-case fixtures, ginning machinery, agricultural implements, fertilizers, and ice. Columbus contains an industrial school, a conservatory of music, and a public library. The water works are under municipal control. Pop., 1890, 17,303; 1900, 17,614; 1910, 20,554; 1920, 31,125.

Columbus was laid out in 1828 and incorporated in 1829. During the Civil War it was an important Confederate depot of supplies and was only surpassed by Richmond in the quantity of manufactured articles furnished to the Confederate army. It was captured by Federal forces April 16, 1865.

COLUMBUS. A city and the county seat of Bartholomew Co., Ind., 41 miles south by east of Indianapolis, on the Pittsburgh, Cincinnati, Chicago, and St. Louis, and the Cleveland, Cincinnati, Chicago, and St. Louis railroads, and on the east fork of the White River (Map: Indiana, D 3). It has extensive manufactures of pulleys, tanned leather, threshing and sawmill machinery, tools, transmission gears, gasoline engines, flour, furniture, etc. Settled in 1821, Columbus was chartered as a city in 1864.

The government is vested in a mayor, elected quadrennially, and a city council. The water works and electric-light plant (for city use) are owned and operated by the municipality. Pop., 1900, 8130; 1910, 8813.

COLUMBUS. A city and the county seat of Cherokee Co., Kans., 53 miles by rail south of Fort Scott: on the St. Louis and San Francisco, the Joplin and Pittsburg, and the Missouri, Kansas, and Texas railroads (Map: Kansas, H 8). It is the centre of a farming and a coal, lead, and zinc mining region, has a considerable trade in agricultural products, and contains machine shops, grain elevators, flour mills, cigar factory, bottle works, canning factory, and an extensive brick-making plant. Natural gas occurs in the vicinity. A Carnegie library and fine high school are notable features. The water works are the property of the municipality. Pop., 1900, 2310; 1910, 3064.

COLUMBUS. A city and the county seat of Lowndes Co., Miss., 123 miles, by rail, west of Birmingham, Ala.; on the Tombigbee River, which is navigable six months of the year, and on the Mobile and Ohio and the Southern railroads (Map: Mississippi, J 3). It has a public library, two hospitals, and is the seat of the State Industrial Institute and College for young women, Franklin Academy, for white, and Union Academy, for negro children. Columbus carries on an extensive trade in cotton, hay, and gravel. It has cotton and oil mills, foundries and machine shops, brickkilns, stave works, lumber mills, and manufactories of plows, underwear, hosiery, comforts, yarn, and stoves. To the east there are coal and iron in abundance. Columbus was settled in 1830, incorporated in 1832, and is governed at present under a charter of 1884, which provides for a mayor, elected every two years, and a council, elected on a general ticket. The water works are owned and operated by the city. Pop., 1900, 6484; 1910, 8988; 1920, 10,501.

COLUMBUS. A city and the county seat of Platte Co., Neb., 92 miles by rail west by north of Omaha; on the Loup River a short distance above its confluence with the Platte, and on the Union Pacific and the Chicago, Burlington, and Quincy railroads (Map: Nebraska, G 3). It is of importance as a railroad junction and has flour mills, foundry, brewery, wooden-shoes factory, roller mills, and a creamery. The city contains a hospital and a Carnegie library, and owns its water works. Along the Loup River are ancient Indian mounds, and the city is believed to occupy the site of the old Indian city of Quivera. Pop., 1900, 3522; 1910, 5014.

COLUMBUS. The capital of Ohio and the county seat of Franklin County, the third city of the State in population. It is situated at the confluence of the Scioto and Olentangy rivers and extends eastward to Alum Creek, near the geographical centre of the State, 120 miles northeast of Cincinnati and 135 miles southwest of Cleveland (Map: Ohio, E 6). The city is built on generally level ground, at an altitude of 780 feet, and covers an area of about 22 square miles. Its two main central thoroughfares, High Street and Broad Street, intersect at right angles, and other streets in the central portion conform. High Street is the main business thoroughfare, 100 feet wide; Broad Street, 120 feet wide, with four rows of trees for a considerable portion of its length, is a street of public buildings, churches, and fine residences. At the southeast corner of High and Broad streets is the Capitol Square of 10 acres, in the centre of which stands the Capitol building (completed in 1857), a gray stone structure of the Grecian Doric style of architecture, 304 feet long, 184 feet wide, with a rotunda 158 feet high. To the east, connected with it by a wide terrace, is the Judiciary building (completed in 1900), in which are a number of other State offices. Notable art features of the interior of the Capitol are William H. Powell's painting of "Perry's Victory on Lake Erie," portraits of all the Ohio governors, and Thomas D. Jones's sculptured representation of the surrender of Vicksburg by Pemberton to Grant. At the west entrance to the square is the McKinley memorial (H. A. McNeill, sculptor), and near the northwest corner of the building, the "Ohio's Jewels" group of statues of Grant, Sherman, Sheridan, Chase, Stanton, Garfield, and Hayes. Other public buildings are the city hall, chamber of commerce, the post office and Federal court, and the Y. M. C. A., all facing Capitol Square. On Broad Street is the Soldiers' and Sailors' Memorial building, with an auditorium seating 4000, and at the head of State Street is the Columbus Public (Carnegie) Library. Ohio State University (q.v.), established by Act of 1870 as Ohio Agricultural and Mechanical College and reorganized in 1878 under its present name, is located here. Other educational institutions are: Capital University (Lutheran), founded in 1850; St. Mary's of the Springs (Catholic), in 1866; St. Joseph's Academy (Catholic), 1875; Columbus Art School; and three private schools of academy grade, two for girls and one for boys. The State schools for the blind, for the deaf and dumb, and for the feeble-minded are also located in Columbus, as well as the State central hospital for the insane, and the Ohio penitentiary, which is soon to be removed to a 1500-acre farm in Madison County. Of county buildings there are the courthouse, the children's home, infirmary and tuberculosis hospital (completed in 1914). Other hospitals are: St. Francis, St. Anthony's, Mount Carmel, Grant, St. Clair, Protestant, and Mercy. Besides the Library of Ohio State University (140,000 volumes), there are here Ohio State Library (225,000 volumes), including a traveling library (88,000 volumes), available for responsible organizations in any part of the State and having departments of library organization and legislative reference; Columbus Public Library (85,000 volumes), including an endowed music section (7500 volumes) and a Lincoln collection (2000 volumes); Public School Library (90,000 volumes), miscellaneous and supplementary reading, and the Law Library of the Supreme Court, with complete sets of State, Federal and many foreign reports, statutes, and digests. The city has nine parks, with a total area of 260 acres, two amusement resorts, and a United States military post and recruiting station, the grounds of which are beautifully parked and open to the public. The Ohio State fair grounds of more than 100 acres, with walks, driveways, and buildings, some of which are used by the Ohio College of Agriculture, is just outside the city's north boundary line.

Columbus is an important commercial and manufacturing centre because of its nearness to the coal, iron, and natural-gas fields and its position on the line of East and West travel. Nine trunk-line railroads, 16 divisions, and 7 electric interurban traction lines afford excel-

lent transportation facilities for the manufacturing interests. The city is connected by a feeder with the Ohio Canal, completed to the Ohio in 1832. It is also on the line of the National Road from Cumberland, Md., westward, completed and turned over to the States in 1836. Including the industries located just outside the city limits, there are here 700 manufactories, with an annual product valued at $70,000,000. Fifty-eight of these are foundries or machine shops. Carriages, wagons and materials, boots and shoes, patent medicines and compounds, malt liquors, tobacco, regalia, society emblems, and oleomargarine are leading products. More than half of the forged anvils used in the United States and most of the piano stools are made here.

The government is administered by a mayor and a unicameral council elected every two years, the mayor appointing the director of safety and the director of public service. The people elect the treasurer, auditor, and solicitor. A charter commission, elected in 1913, submitted, in May, 1914, a new charter offering a modified Federal form, with a number of progressive features, such as nonpartisan ballot, preferential voting, recall of elected officials, the referendum, and a small council elected at large. The charter was adopted, effective January 1, 1916. The city has its own water works, electric-light plant, garbage and refuse disposal, sewage disposal and sewer farm, and other and more common public utilities. The investment in the four mentioned is about $8,500,000. The water-works system includes a storage reservoir and filtration system. Current from the electric-light plant lights the streets and municipal buildings, while garbage reduction is done at a net annual profit of about $25,000. There are 300 miles of sewer and 240 miles of paved streets. City assets (1913), $35,157,723.63; liabilities, $17,633,831.92. Pop., 1830, 2435; 1850, 17,882; 1870, 31,274; 1890, 88,150; 1900, 125,560; 1910, 181,511; 1920, 237,031.

The first permanent settlement within the city limits was made by Lucas Sullivant and party, in 1797, at the confluence of the two rivers, and was named Franklinton. Columbus was platted on the east bank of the Scioto in 1812, and the site was accepted by the Legislature for the capital. In the first Capitol building the Legislature first met in 1816. In that year Columbus became a borough; in 1834 it became a city, and in 1870 Franklinton was annexed. In 1832 and again in 1849 the city suffered severely from cholera. In March, 1913, a flood devastated the West-side lowlands; 4071 dwelling houses were flooded, 345 being damaged beyond repair; 20,000 persons were fed and sheltered for many days, the property damage was estimated at $5,625,000, and 94 lives were lost. Consult: J. H. Studer, *Columbus, Ohio: Its History and Resource* (Columbus, 1873); Alfred E. Lee, *History of the City of Columbus* (New York, 1892); Fitzpatrick and Morris, *The Franklinton Centennial* (Columbus, 1897); W. A. Taylor, *Centennial History of Columbus.*

COLUMBUS. A city and the county seat of Colorado Co., Tex., 87 miles by rail west of Houston, on the Colorado River and on the Southern Pacific Railroad (Map: Texas, D 5). It is in a fertile agricultural region and has a considerable trade in cotton, live stock, hides, etc. The water works are owned by the city. Pop., 1890, 2199; 1900, 1824; 1914, about 1800.

COLUMBUS. A city in Columbia Co., Wis., 63 miles east-southeast of Milwaukee, on the Chicago, Milwaukee, and St. Paul Railroad, and on Little Crawfish River (Map: Wisconsin, D 5). Columbus contains the county normal school, St. Mary's Hospital, and a public library. It is in an agricultural and stock-raising district and has pea canneries, brewery, flour mill, and carriage and wagon shops. Pop., 1900, 2349; 1910, 2523.

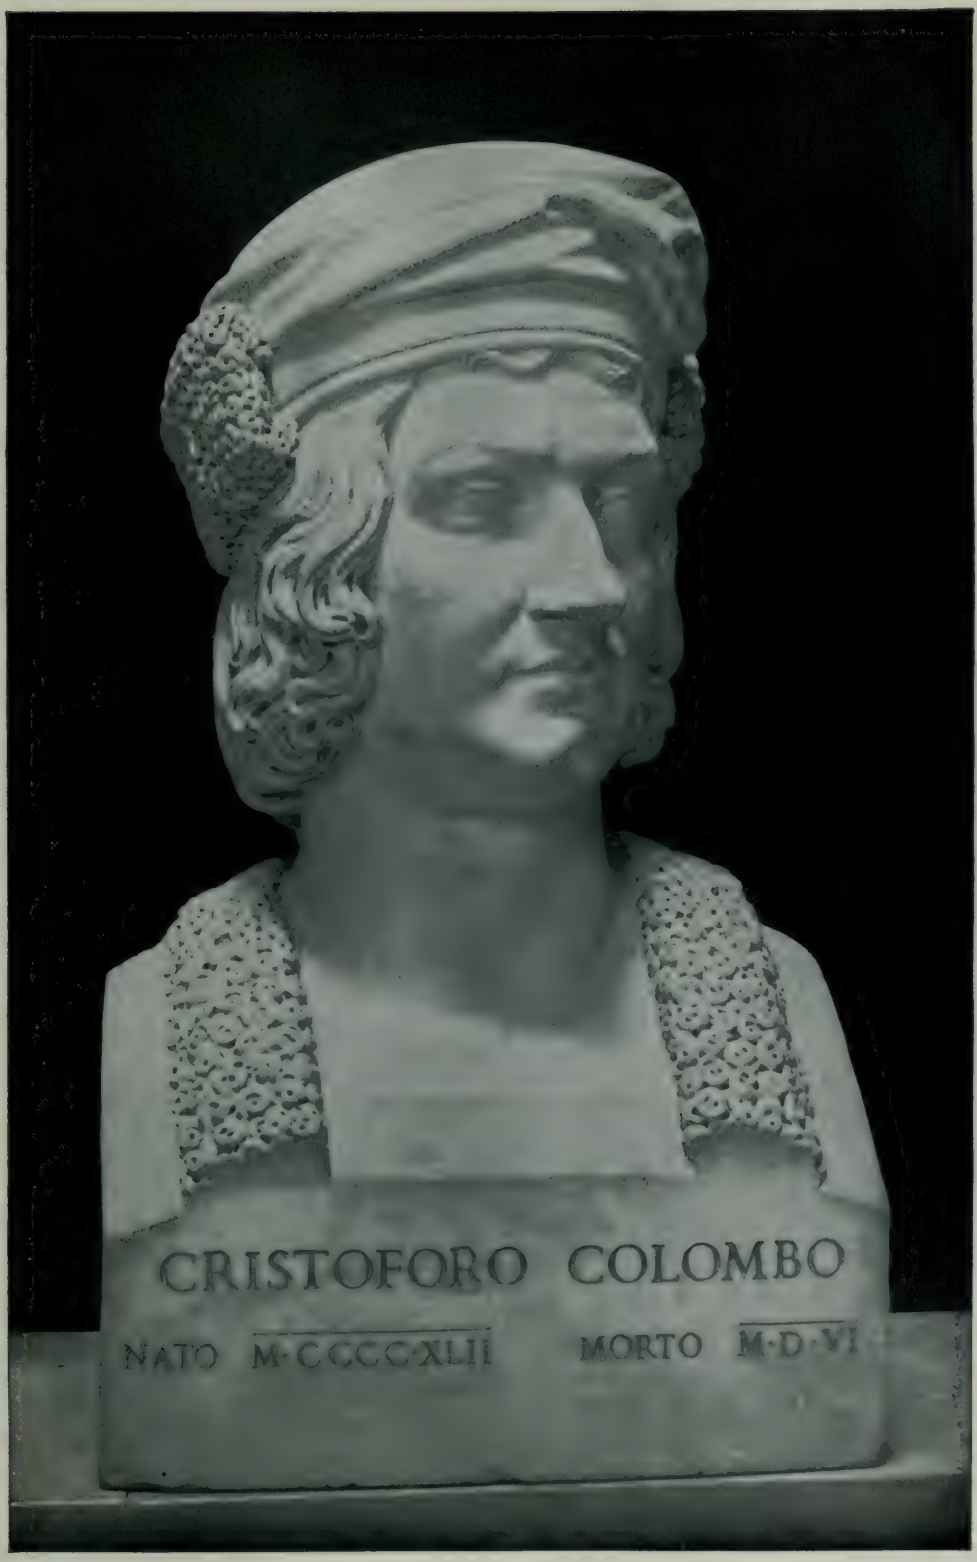
COLUMBUS, Bartholomew (Bartolomé Colón) (c.1461–1514). A brother of Christopher Columbus. He was a sailor by profession and in the year 1480 joined Christopher at Lisbon. In 1489 he was sent to England by his brother to seek assistance from Henry VII for the execution of his project. He was taken by pirates and landed in England in a destitute condition, and on presenting himself at court was unfavorably received by the King. He then sought help at the court of Charles VIII in France. Accounts vary as to the treatment he received here, some authorities claiming he was unfavorably received, and others saying that, because of the news of Columbus' successful expedition, Charles received him well and aided him on his return journey. Whatever may be the truth of this matter, in January, 1494, he returned to Spain and was given command of a fleet of three caravels sailing for Española. He arrived there in June of the same year, just in time to render effectual assistance to his brother, who was being hard pressed by the unruly members of the little Spanish colony. From that time on he became the most devoted follower of the Admiral, who in 1495 made him hereditary *Adelantado*, or Governor, of Española, a title which was confirmed by the crown in 1497. In March, 1496, he assumed command of the colony on the departure of his brother. He founded the town of San Domingo and effectually repressed a native insurrection. During the hardships of the last voyage of Christopher Columbus Bartholomew proved of invaluable assistance. At Puerto la Gloria in 1504 he repressed a mutiny among the sailors. Late in life he received some recognition for his services from the crown, which bestowed on him the island of Mona, near Española, as a possession. He died at Seville in December, 1514.

COLUMBUS, Christopher (the usual English form, adopted from the Latinized form of the Italian Colombo, which was the original spelling of the family name. After the discoverer entered the Spanish service he became known as Cristóbal Colón) (1451–1506). The discoverer of America. There have been so many fanciful tales related, and so many wild guesses made, concerning the life and work of Columbus that we decide to give here a brief documentary chronology of his life down to 1493, beyond which point there is less confusion. This chronology is obtained from Henry Vignaud's *Histoire critique de la grande entreprise de Christophe Colomb*, where all the documents are cited.

Columbus was born in Genoa between Aug. 26, 1451, and Oct. 31, 1451. His father was Domenico Colombo, a weaver, and his mother, Susanna Fontanarosa. There were neither nobles nor sailors in the family, all of whose members were artisans. Nor was Columbus related to the noble family of Colombo of Cuccaro, nor to the two admirals called Colombo. He had no university training, did not navigate in his youth, and in 1472 was still a weaver in Savona.

The last date at which we are certain of his residence in Italy is Aug. 7, 1473. He did not serve under the two admirals Colombo, and made no campaign under "King" René d'Anjou, Count of Provence. About 1474–75 he made, from Genoa or Savona, a voyage to Chios, probably with the two Genoese, Spinola and Di Negro. In 1476 he embarked, again from Genoa or Savona, in one of several Genoese merchantmen bound for England. These vessels were attacked at St. Vincent, Aug. 13, 1476, and Columbus took refuge at Lisbon. Later he continued to England and sailed up into the Northern Seas, but did not reach Iceland. In 1477–78 we find him in commerce at Lisbon. In August, 1479, he visited Genoa and left a deposition stating that he was a citizen of Genoa and about 27 years old. In this year or the next he married, at Lisbon, Felipa Moniz Perestrello, whose exact relationship with the families of Moniz and Perestrello is not well established. In 1480, and probably at Lisbon, was born Diego Columbus, oldest son of the discoverer, and his only child by his marriage. After his marriage his mother-in-law gave him certain papers of Perestrello which made Columbus decide to devote himself to maritime discovery, It was in 1481 that the apocryphal correspondence with Toscanelli was supposed to have taken place. From 1482 to 1484 Columbus is supposed to have made several voyages to the coast of Guinea, and he claims to have measured the length of a degree at the equator; and during this same period he made to João II of Portugal the same proposals that he made later to the Spanish rulers. João II rejected them, although in 1484 he is supposed to have sent a secret mission to learn the truth of Columbus' claims. Late that year or early the next, angered at the conduct of João II, Columbus fled secretly with his young son (his wife being already dead) to Spain. In 1485 he left Diego at La Rábida (two of whose monks, Pérez and Marchena, encouraged his plans), went to Seville, saw the two dukes of Medina Sidonia and Medina Celi, and lived awhile with the latter. Early the next year he went to Córdoba, was well received by the sovereigns (who granted him an audience in April or May), and followed them in November to Salamanca, where he was permitted to appear before a royal commission appointed to examine his pretensions. The university does not appear in the proceedings, but there were favorable conferences held in the monastery of San Estéban. Early in 1487 he returned to Córdoba, received certain sums from the royal purse, as a gratification or for services rendered, and began in November or December his affair with Beatriz Enríquez de Arana, who was neither noble nor rich, nor ever became his wife. During 1488 occurred an exchange of letters between Columbus and João II, and possibly a brief visit of Columbus to Portugal. In July he received a further gratification from the Spanish rulers; and on August 15 of this same year, 1488, his mistress Beatriz Enríquez de Arana gave birth to their son Ferdinand. The Spanish rulers, in May, 1489, ordered him to court, which was probably at Baza, where they were conducting a siege. During 1490, however, he was in dire want and is supposed to have sold books and made maps for a living; and the royal commission finally rejected his plans. In discouragement he left the court, and started for France to offer his services to Charles VIII, going first to La Rábida to get his son Diego. Here he was encouraged to give up his plan of going to France and to continue his efforts in Spain. He met Pero Vázquez de la Frontera (who gave him much valuable information about islands beyond the Sargasso Sea) and Alonso Martín Pinzón (who had been to Rome and obtained information about the island of Cypangu), and the latter agreed to aid him. Pérez then wrote to the court, and Pinzón is supposed to have done likewise. Pérez, summoned by the Queen, easily arranged for Columbus' recall, and late in the year began the celebrated Santa Fé conferences, in which Columbus named his conditions: a peerage, the office of admiral, and that of Viceroy of the lands he should discover, etc. Columbus was present at the fall of Granada, Jan. 2, 1492. Later in the same month the Commission of Santa Fé rejected his proposals as chimerical, and Columbus left Granada with renewed intention of going to France. But Luís de Santángel intervened, and Columbus was immediately recalled. Matters now moved more rapidly. By the Capitulations of Santa Fé (April 17, 1492) he was authorized to search for and take possession of certain islands, but no mention was made of the Indies or of India. By the Capitulations of Granada (April 30) the titles and offices of Columbus were confirmed and made hereditary, but he was to be invested with them only after the discoveries had been made. This document and its confirmation (Act of April 23, 1497) both fail to make any mention of India. After various delays, some of which were due to the unwillingness of sailors or others to embark on such an expedition, Pinzón, whom Columbus for a while seems to have neglected, threw his influence into the movement, and the expedition was organized: three vessels (*Santa María*, *Pinta*, and *Niña*), 120 men (of whom 90 for the crews), baggage, merchandise for trading, provisions, and a little artillery.

The expedition set sail from Palos, Aug. 3, 1492, made a short stay in the Canary Islands, and sailed from Gomera on September 6. At the moment of sailing Columbus gave his captains and pilots written instructions not to sail during the night after they should have proceeded 700 leagues, as he expected to find land before they had gone 750 leagues. There were various symptoms of revolt during the month; and when on October 4 or 5 (despite Columbus' not having announced the full distance sailed each day) they had gone farther than the 750 leagues mentioned by Columbus, the crews mutinied and wished to return to Spain. Pinzón's energetic attitude, when consulted by Columbus, restored order, and they proceeded. October 7, on Pinzón's advice, they changed their course, which thitherto had been due west, and steered somewhat south of west. The sailors again became terrified, but Columbus succeeded in calming them, and told them that having come so far on his way to *las Indias*, he intended to go through at any cost. This is the second time that the words *las Indias* appear in the Las Casas version of Columbus' log. They were never used in the negotiations that led to his being authorized to make the expedition, which spoke consistently of his going to "discover and take possession of certain islands in the sea of whose existence Columbus knew." Nor is their presence in his log proof that he was really



CHRISTOPHER COLUMBUS

FROM THE BUST IN THE CAPITOLINE PICTURE GALLERY, ROME

looking for India by a western route, for the usage of the times when Las Casas made his résumé of the log applied the words *las Indias* to the Antilles as well as to India. In the early morning hours of Oct. 12, 1492, land was discovered, and at daybreak they disembarked on an island called by the natives Guanahani. Columbus took possession of it and called it San Salvador. There is some uncertainty concerning the exact situation of this island. Columbus was certain that Guanahani was not the marvelous island of Cypangu. After considerable cruising and doubting he finally decided that Cuba must be Cypangu, and disembarked October 28. Further explorations, including the determining of the longitude and latitude of the island, forced him on November 2 to the conclusion that Cuba was not Cypangu, but a projection of Asia. In further explorations Pinzón became separated from Columbus, and on November 22 discovered the island of Haiti. Columbus rejoined him on December 5 and named the island Española. Although the log does not say so, Columbus himself says elsewhere (as do also his son, his brother, and Las Casas) that he recognized it as being Cypangu, and he continued in that belief until his death. On December 26 they built the fort of La Navidad and left 37 men, with ample provisions, as a garrison. December 28 the *Santa María* was wrecked, and all on board went to the *Niña*. The return voyage was begun Jan. 4, 1493. In the Azores, which they reached February 15, Columbus wrote his first account. March 4 he reached Lisbon, where he wrote his second account. On invitation of the King of Portugal, Columbus went to see him on March 9, and on the 15th disembarked at Palos and dispatched a courier to the "Catholic Kings," who were at Barcelona. On the 30th they acknowledged the receipt of his letters and invited him to come to them at Barcelona. In their letter they spoke of his discoveries as having been made in *las Indias*. This royal letter is the first official document in which this expression appears. In bulls of May 3 and 4, 1493, the Pope sanctioned the rights of the "Catholic Kings" to the islands and lands discovered by Columbus, who was spoken of as having been sent to discover distant islands and lands situated in seas that no one had yet sailed. There was in these bulls no mention of the route to India.

Every assistance was promised Columbus towards equipping a second expedition. Seventeen vessels were soon ready, carrying 1500 persons, and on Sept. 25, 1493, they set sail. The island of Dominica was reached on November 3, and on the 27th Columbus anchored off the fort of La Navidad, which was found deserted. The garrison had been killed by the natives, whom the outrages committed by the white men had provoked beyond endurance. Abandoning this, Columbus founded a new town (Isabella), and the next two years were spent in an attempt to establish a form of government and in several exploring expeditions into the interior of Española and the neighboring islands. Many causes united to disturb the peace of the colony, and Columbus at length determined to return to Spain, where his enemies were actively trying to undermine the confidence of the sovereigns in him. Landing at Cádiz on June 11, 1496, he proceeded directly to the court, where he was most graciously received and quickly restored to grace. He was promised whatever he desired for a new expedition, but there was a long delay, due largely to the persistent opposition of Fonseca, Bishop of Palencia, through whose hands everything had to pass before Columbus could secure his outfit. It was not until May 30, 1498, that six vessels were ready to sail. A more southerly route than before was followed, and the voyage was prolonged until July 31, when the three peaks of Trinidad were sighted. After a fortnight's rest in the Gulf of Paria Columbus coasted the South American mainland, which he now saw for the first time, westward as far as Margarita, and then, having first decided that Paradise must be situated in the interior of the modern Venezuela, he stood across to Española. Arriving at Santo Domingo, which had become the principal town in the Indies, he learned that a number of the colonists had rebelled during his absence and that everything was at odds. His temperament was ill suited to dealing with the turbulent crowd who defied his authority, and he could do little towards restoring peace and order. Both sides sent agents and emissaries to Spain, with the result that, on Aug. 23, 1500, Francisco de Bobadilla arrived at the island with royal orders authorizing him to supersede Columbus in the government. Without waiting to investigate the charges against him, Bobadilla arrested Columbus, treating him with heartless indignities for which no justification can be found in the surviving records of the colony. He was placed in irons, denied visits from his brothers and partisans, and in October sent back to Spain.

The news that the Admiral of the Ocean Seas had arrived home in chains served his cause better than any argument. He was promptly released and summoned to court, where every favor was shown him. King Ferdinand, however, was too shrewd to restore him to the full powers of control which he claimed by virtue of his discovery. As soon as he became convinced that there was little use in trying to secure his rights, Columbus asked for a fleet with which to continue his discoveries. This was readily granted, and in May, 1502, he set sail with four caravels to seek a route to the real East. A part of the royal grant was the condition that he should not revisit Española, but on June 29 Columbus anchored off Santo Domingo. Being forbidden to enter the harbor, he refitted as best he could outside, where he successfully weathered a storm which, curiously enough, overwhelmed a fleet on which Bobadilla and several of his bitterest enemies had set sail for Spain. Columbus proceeded westward, and between July 30, 1502, and Jan. 24, 1503, he sailed along the coast of Central America, from Honduras to Veragua, where he attempted a settlement. In April, 1503, the disheartened survivors insisted on abandoning the enterprise. With the greatest difficulty the rotten ships were brought as far as Jamaica, where, in August, they had to be beached to save their cargoes. The Admiral had been confined for many weeks to his bed, with a complication of mental and bodily ailments, from which he aroused himself at moments of special danger to show his earlier courage, enthusiasm, and skill. From Jamaica a messenger, Diego Mendez, started across to Cuba in a canoe to seek help at Santo Domingo. It was many months before the pitiful survivors learned that he had not perished on the way. He reached Española in safety, but Ovando, who had succeeded Bobadilla, delayed as long as he

could before permitting Mendez to hire a vessel to go to the rescue of the castaways on Jamaica. At last, in June, 1504, the survivors who had remained faithful to the Admiral through dangers and disasters were once more embarked on their way back to civilization. Refitting the vessel at Santo Domingo, Columbus proceeded to Spain, landing at San Lucar de Barrameda on November 7. Before the end of the month Queen Isabella, upon whom all his hopes rested, died. Columbus went to Seville, where he busied himself during such intervals of freedom from pain as he had in trying to put his affairs in order. In May, 1505, he vainly journeyed to Segovia to plead with the King for some recognition of his rights and those of his son. Thence he retired to Valladolid, where he died, May 20, 1506. His body was laid in the Carthusian monastery of Santa María de las Cuevas at Seville, but in 1542 it was removed, with that of his son Diego, to be interred in the cathedral of San Domingo, Hispaniola (Haiti). When that island was ceded to the French in 1795, a transfer was again made, to the cathedral of Havana, and at last, after Spain's loss of Cuba in 1898, the bones of father and son were taken back to Seville and placed in the cathedral there.

Columbus literature, already very voluminous, was more than doubled during the celebration of the four hundredth anniversary of his discovery of America in 1892. The chief source for information about him was for many years Navarrete's great collection of documents, published at Madrid between 1825 and 1837. This has been in a measure supplanted by a monumental work published by the Italian government, *Scritti di Colombo* (Rome, 1892). The standard English version of the *Letters* is Major's translation in the Hakluyt Society volumes for 1847 and 1870, supplemented by Markham's translation of the *Journal* in 1843. There is a convenient edition of the *Letters* edited by W. C. Ford (New York, 1892). The great critical study of Columbus' life and family is by Harrisse, in 2 vols. (Paris, 1884), the results of which were presented in English by Winsor (Boston, 1892). Later works are those of Markham (London, 1893), Adams (New York, 1892), Thacher (ib., 1903–04); Ober (ib., 1906), and especially the following works by Henry Vignaud, the distinguished counselor of the United States Embassy at Paris, which must be used to supplement and correct the great work of Harrisse previously mentioned: *Toscanelli and Columbus* (London, 1902); *Critical Study of the Various Dates Assigned to the Birth of Columbus* (ib., 1903); "Proof that Columbus was Born in 1451," in *American Historical Review* (Jan., 1907); *Etudes critiques sur la vie de Colomb avant ses découvertes* (Paris, 1905); *Histoire critique de la grande entreprise de Christophe Colomb . . . 1476–1493* (2 vols., Paris, 1911).

COLUMBUS (Colón), Diego (in It., *Giacomo*) (c. 1468–?1515). The youngest brother of Christopher Columbus. He was born probably at Genoa, and upon the news of his brother's great discovery came to Spain. He accompanied Christopher on his second voyage and late in 1494 was at the head of a commission intrusted with the government of Española in the absence of the Admiral. In 1496 he went to Spain to defend his brother against the charges submitted by some of the unruly members of the colony. He returned to Española, but fell into disgrace and was sent in chains to Spain in the year 1500. He is thought to have entered the Church a number of years before his death.

COLUMBUS (Colón), Diego (1480–1526). Eldest son of Christopher Columbus. He was born probably at Lisbon and came in 1484 to Spain with his father, who left him for some time with his friends at the convent of La Rábida, while he himself went to seek aid at the court. In 1494 he became page to the Crown Prince, Juan, and after the latter's death in 1497 he was admitted into the household of Queen Isabella, where he remained till 1504. After the death of his father he received the title of Admiral of the Indies, but was refused the viceroyalty which he claimed as his paternal right. In 1508 he married a daughter of the house of Alba, and through her influence succeeded in being made Governor of the Indies. In 1509 he arrived at Española to take possession of his office. He never desisted in his claim to the viceroyalty and to a share of the revenues from the New World due him, and in 1520 finally won his case. He was recalled, however, from his government in 1523, and though he made his peace again with the court, did not return to the New World. He died at Montalbán in 1526. His son Luís (c. 1520–72), born at Santo Domingo, received the title of Admiral of the Indies in 1529. He finally abandoned all claims of the family to the viceroyalty and received in compensation an estate in Jamaica and one near Veragua, with the titles of Duke of Veragua and Marquis of Jamaica. In 1563 he was banished on account of his dissolute life to Orán, where he died. With Diego Colón (died 1578), a nephew of Luís and a great-grandson of Christopher, the male line of the great Admiral became extinct. The present dukes of Veragua trace their descent from a sister of the last Diego.

COLUMBUS, Ferdinand (Fernando Colón) (1488–1539). A natural son of Christopher Columbus by Beatriz Enríquez de Arana, of Córdoba. In 1498 he became page to Queen Isabella. He accompanied his father on his last voyage to the New World, and in 1509 he sailed for Española with his brother Diego, who had been made Governor of the Indies. Returning to Spain, he settled down as a cosmographer and writer on navigation. He traveled extensively in Italy, the Netherlands, Germany, and France, and in 1522 visited England. Two years later he was a member of the board of arbitration selected to decide on the conflicting claims of Spain and Portugal to the Molucca Islands. His political career was an active one and mainly in line with his profession as geographer. Two years before his death he founded a school of mathematics and education at Seville. His library of more than 12,000 volumes he left to the chapter of the cathedral at Seville. Ferdinand is best known as the probable author of a life of his father, upon which all subsequent biographies of Christopher Columbus have been based. We possess this work only in the form of the Italian translation published at Venice in 1571, the original having been lost. Ferdinand's claim to the authorship of this biography has been denied by eminent authorities and just as warmly defended; the question is still a mooted one.

COLUMBUS BARRACKS. A United States military post established in 1863 and originally an arsenal. The reservation embraces 77 acres

and is one mile from Columbus, Ohio, which is the nearest railroad station. It is an important recruiting depot for the United States army and contains quarters for 25 officers and 8 companies of infantry.

COLUM-CILLE. See COLUMBA, SAINT.

COL'UMEL'LA (Lat., dim. of *columna*, column). A descriptive term employed in several groups of plants, but especially in mosses and molds. In the mosses the columella is a central axis of sterile tissue extending through the capsule; while in the molds it is the bulging wall at the base of the sporangium, which extends more or less into the cavity of the sporangium.

COLUMELLA, LUCIUS JUNIUS MODERATUS. The most learned of Roman writers on practical agriculture. He was born at Gades (Cadiz), in Spain, and flourished about the middle of the first century. For some time he resided in Syria, but lived chiefly at Rome, and died, most probably, at Tarentum. His great work, *De Re Rustica*, in 12 books—the tenth, *On Gardening*, is in dactylic hexameters—is addressed to one Publius Silvinus and treats of arable and pasture lands, culture of trees, fruits, vegetables, grain, vines, olives, etc., care of domestic animals, birds, and bees, respective duties of masters and servants, and the like. A supplementary treatise relates to trees. This ancient *Book of the Farm* is written in good Latin, and the information is copious, though in some points of questionable accuracy. The best complete edition of Columella is by Schneider, in *Scriptores Rei Rusticæ* (Leipzig, 1784–97); for text of books x and xi, see Lündstrom (ib., 1903, 1907). Consult Barbaret, *De Columellæ Vita et Scriptis* (Nancy, 1888); Becher, *De Columellæ Vita et Scriptis* (Leipzig, 1897).

COLUMN (from Lat. *columna*, column, connected with AS. *holm*, island). In architecture, a vertical support, usually round or polygonal, and having a height much greater than its diameter. A complete or typical column consists of a base (q.v.), shaft, and capital (q.v.). The capital forms at once an ornamental topping for the column and an intermediate member between the vertical lines of the shaft and the horizontal architrave (q.v.) or the impost and spreading spandrel (q.v.) of the arcade, which rests upon it; while the base in like manner mediates between the shaft and the horizontal surface in which the column stands. The shaft is therefore the essential part of the column; for some columns lack bases, as the Greek Doric, and some are without capitals, as in certain late Gothic examples. The shaft is commonly round in section, but its section may be any regular geometrical figure. A square or rectangular column is, however, generally called a *pier;* and whenever the shaft of a vertical support is very massive, or is built up of masonry of several pieces of stone in each course, it is generally called a pier rather than a column. If, on the other hand, each course or horizontal division is composed of a single stone, called a *drum*, the support is termed a column rather than a pier. But this distinction is not always observed, for the vast pillars of masonry which flank the central aisle of the Hypostyle Hall at Karnak, though not composed of drums, are universally called columns. When the shaft is of complex plan, having a central core surrounded by a number of subordinate shafts, as in Romanesque and Gothic architecture, the whole is called a clustered column or, more commonly, a clustered pier. The word *pillar* is frequently but loosely used in the senses both of column and pier; for its meaning and proper use, see that term. A column may be of any material—stone, marble, brick, wood, or metal; but ordinary squared or rough supports of timber are properly called *posts*. Columns of stone or marble are *monolithic* when the shaft is a single piece; only in the rarest instances are base, shaft, and column hewn all of one piece. Columns carry the superstructure by means either of horizontal beams or lintels, called architraves (q.v.), or arches. In the latter case a block, called an impost block or supercapital, is sometimes interposed between the capital and the springing or impost of the arch, as in Byzantine architecture; sometimes the interposed feature comprises a square section of an entire entablature—architrave, frieze, and cornice—as in many late Roman examples. In both Greek and Roman architecture, and the modern styles derived from them, certain forms of column are uniformly combined with particular forms of entablature, according to more or less well-defined rules; such a specific combination is called an *order* (see ORDERS OF ARCHITECTURE); but no such uniform combinations are found in Egyptian, Oriental, or mediæval architecture. Various types of column and their characteristic capitals are shown in the accompanying plate. Some of the special forms, uses, and types of columns, including the metal supports in modern steel construction, are briefly mentioned and explained at the end of this article.

Historical. In the earliest Chaldean architecture the column seems to have played no part whatever; even in the later Assyrian palaces it was used only in a subordinate function, for small secondary supports, probably of wood, as shown in the relief pictures. It was the Egyptians who, lacking good timber but having abundant stone, first developed columnar types of architecture, placing massive columns in rows spaced as far apart as was practicable to span with stone lintels. While they used one undeviating type of cornice (q.v.), the forms and proportions of the columns varied greatly, both as to the shaft, which was round, quatrefoiled, or clustered in section, and the capital, of which the most important types were the lotus bud (or papyrus bud), either simple or clustered; the bell-shaped or campaniform, simple or multifoiled; the palmiform, and the Hathor-headed, with four masks of Hathor surmounted by a model of a shrine. A simple round disk was the only form of base used. The shaft generally swelled from the base and contracted gradually upward, and at the top was decorated by five or six bands under the capital. The round shafts were often covered with incised pictures and hieroglyphics. The great central columns of the Hypostyle Hall at Karnak (q.v.) are 75 feet high and 15 feet in diameter (see ARCHITECTURE, Plate of Temple of Karnak). The Egyptians employed columns chiefly as interior supports; the Greeks used them both as interior and exterior supports, and developed in the Doric, Ionic, and Corinthian orders types of column and entablature, and of architectural effect, which, further elaborated by the Romans, have furnished models and suggestions for the architecture of subsequent ages. The earliest Greek columns, those of Crete, Mycenæ, and

Tiryns, seem to have been derived from wooden originals in tree trunks set up with the small end down, as they all taper downward. They were perhaps often of wood plated or sheathed with bronze; but a few stone columns have been found, among them those of the doorway of the Treasury of Atreus at Mycenæ, now restored and reërected in the British Museum.

The columns of the post-Homeric or historic Greek architecture were entirely different from the early types just described. For over 600 years the Greeks employed the Doric column with but slight variations, the earliest known examples, at Corinth, dating from perhaps 650 B.C. The Doric column had no base; its sturdy shaft, tapering slightly upward in a delicate convex curve (entasis) to the capital, had 16 or 20 shallow vertical channelings meeting in sharp edges or *arrises*. The capital consisted mainly of a spreading convex-profiled circular molding (echinus) supporting a plain square abacus (q.v.). The shaft was composed of drums, and the height of the column varied from less than five times the lower diameter in early examples to more than seven diameters in late examples. Those of the Parthenon are six feet in diameter at the foot, and 34.23 feet high; they are spaced somewhat over two diameters on centres. The great massiveness of the earliest examples counts against the theory that they were derived from wooden prototypes; but their origin is as yet undetermined. In the sixth century B.C. the Ionic type, indubitably derived from wooden prototypes, was introduced into European Greece from Asia, and by its more slender proportions and greater richness of detail won favor for certain classes of buildings of moderate size. This type was from 7½ to 9½ diameters in height, rising from a richly molded circular base to a capital with spiral volutes connected by a band, above a carved echinus. In Asia Minor this order was employed for temples of colossal size, e.g., that of Artemis (Diana) at Ephesus. In the fourth century the Corinthian capital, of ornate design with leaves and volutes around a bell-shaped core, was introduced as a variant of the Ionic, the column being otherwise of the slenderest Ionic type. Later the Romans developed an entirely distinct Corinthian order.

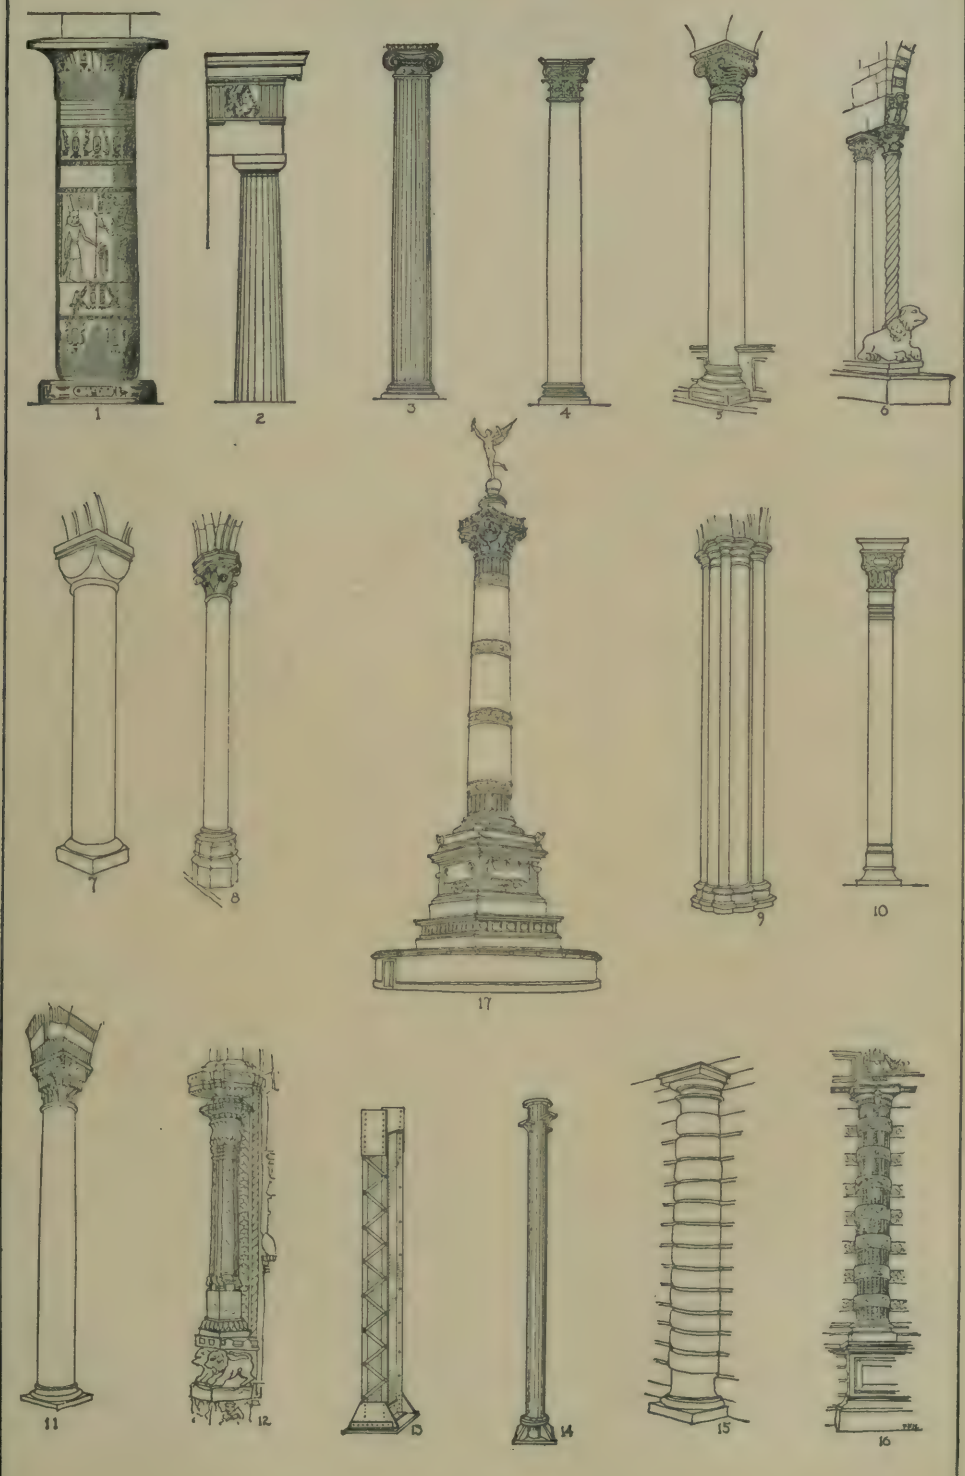
These various forms of column were used by the Greeks chiefly for exterior colonnades; but in the larger temples and other structures they appear also as interior supports, sometimes in two stories. In the temple of Apollo at Bassæ and in the Propylæa at Athens the interior columns were Ionic; those in the Tholos at Epidaurus were Corinthian; while in all three the exterior columns were Doric. In the unfinished temple of Zeus at Agrigentum, and in the tiny choragic monument of Lysicrates at Athens, engaged columns, i.e., columns partly sunk, as it were, in the walls, were used on the exterior.

The Romans developed the column into an architectural feature of far greater flexibility, variety, and splendor than the Greeks. Their Tuscan and Doric columns were variants of earlier Etruscan types; the Greek Ionic they adopted with little change; the Greek Corinthian they elaborated into a distinct order with its own entablature; and to these four they added the Composite, a variant of the Corinthian. While the proportions of these columns varied less widely than the Greek, it is a mistake to assert that they were uniform at any one time, or regulated by a rigid canon. Moreover the Romans greatly increased the variety of their columnar architecture by employing monolithic shafts of polished marble, porphyry, and granite; by superposing the orders in many-storied buildings; by the introduction of pilasters; by setting columns on pedestals; by coupling columns with pilasters; and by the use of engaged columns in combination with arcaded structures. In vaulted buildings the vaults were made to spring from huge columns surmounted by blocks of a complete entablature; and as purely decorative features small columns and pilasters were employed to flank niches and doors, and larger ones to break up and adorn the surfaces of blank walls, the piers of arches of triumph, and the like. Columns of great size, veritable towers with interior stairs and exterior sculpture, were set up as memorials (see ANTONINE COLUMN; TRAJAN'S COLUMN). In Pompeii columns were frequently built of rubble or brick, and heavily covered with stucco molded into the forms of the various orders and painted in bright colors (see POMPEII). In Roman work generally, the column really or apparently supports an entablature. Only in late work, as at Spalato (q.v.) and in Syria, were columns used as supports for arcades. This use of the column, however, became general in early Christian architecture, in the interiors of basilicas with aisles (see BASILICA), though in some examples the columns carry horizontal entablatures. The Byzantine architects used the column as a support for arches and vaults, employing monolithic shafts like the Romans, but devising wholly new types of carved, basket-like capitals, often surmounted by impost blocks. They never used the engaged column.

In Italy, through the early Middle Ages, the column and pilaster of a semiclassic type never quite passed from use; but in the early Lombard buildings the clustered pier, with four columns or shafts grouped around a central core, made its appearance as early as the eleventh century (San Ambrogio, Milan); and somewhat later the nook shaft or jamb column appeared in the splayed doorways of churches. These types of support spread through France and through Germany, especially the Rhine provinces, and by way of Normandy into England and northern Europe. Out of the Romanesque clustered pier was developed all the splendid clustered shafting of Gothic interiors. The slender shafts had no entasis or diminution; they were sometimes attached and sometimes free, and the capitals, often remotely reminiscent of the Corinthian type, were richly

1. Egyptian lotus-flower column.
2. Greek Doric column from the Parthenon at Athens
3. Greek Ionic column from the Erechtheum at Athens.
4. Roman Corinthian column from the Pantheon, Rome.
5. Byzantine column from St. Sophia, Constantinople.
6. Italian Romanesque column, Verona Cathedral.
7. English Norman column, Ely Cathedral.
8. French Gothic column, church of Notre Dame, Chalons-sur-Marne.
9. English Gothic column, Salisbury Cathedral.
10. Moorish column, Alhambra, Granada.
11. Turkish column, mosque of Suleiman, Constantinople.
12. Hindu column, porch at Peroor, India.
13. Lattice and channel steel column with base.
14. Cast-iron column with base.
15. Rusticated Doric column, Palais du Luxembourg, Paris.
16. Banded Doric column, Palais du Louvre, Paris.
17. Memorial column, Colonne de La Bastille, Paris.

COLUMNS



TYPICAL COLUMNS

FOR NAMES AND DESCRIPTIONS SEE TEXT

carved with foliage, sometimes with grotesques. Gothic shafts were always smooth; but those of the Romanesque period were sometimes richly carved. Round piers, like very massive columns, continued to be used in place of, or in connection with, clustered columns in France and Belgium (and for a while in England), until the decline of Gothic art. Meanwhile the Moslem world had adopted the simple column, with capitals of various types (see MOHAMMEDAN ART). In China and Japan the column seldom appears, its place being taken in interiors by wooden posts; but in India the Jaina and Brahman styles, as well as the Indo-Moslem, produced an infinite variety of columns, more often polygonal than round, and carved into endlessly varied decorative forms.

The Renaissance, first in Italy, then in France, and finally throughout Europe, revived all the Roman forms of columns, devised many charming variations of the Corinthian type of capital, invented new types of shaft—rusticated, banded, and sculptured, and new arrangements of columns, especially by coupling them. The colonnades in front of St. Peter's at Rome, and in Paris those of the Louvre and of the Place de la Concorde, are among the most magnificent of all examples of columnar architecture. In modern practice the Greek as well as the Roman and Renaissance types are in use, and in the United States especially the columnar portico has been used with grandiose effect in a great number of public buildings.

A column having beveled or grooved joints between its drums is a *rusticated* column; one with alternate or occasional drums of larger diameter than the rest is a *banded* column; one projecting from or partly embedded in a wall is an *engaged* column. A column set as a mullion in an opening in the centre of the thickness of the wall is a *midwall* column. A *rostral* column is a memorial or decorative column adorned with symbolic ships' prows projecting from its shafts; *cantoned* columns are those attached to the corners of a rectangular pier. Metal columns may be of cast iron, or "built up" of bars, beams, and plates of wrought iron or steel, and are known by various names according to their form, e.g., *Z-bar* when composed of double-angle irons resembling the letter Z; *box* when built up of two or more channel bars and two plates; H-columns, I-columns, etc., when of sections resembling those letters. A Phœnix column is a circular steel column built up of flanged bars of segmental section. (See FIREPROOF CONSTRUCTION.) The bibliography of columns is practically identical with that of architecture (q.v.); see that for ORDERS OF ARCHITECTURE; and also consult Guadet, *Théorie de l'Architecture* (Paris, 1904) and Longfellow, *The Column and the Arch* (New York, 1899).

COL'UMN. As defined by the *United States Infantry Drill Regulations*, a military formation in which the elements are placed one behind another, whether these elements are files, squads, platoons, or larger bodies. When a regiment is on the march, and each company marching in column of squads, it is said to be "in column of route." The same formation may be adopted by any number of troops in a command. When the science of war was in its infancy, dense column formations were the usual order of battle, much reliance being placed upon it by every European nation except England, who invariably preferred its opposite, the "line" formation. See TACTICS, MILITARY; MARCHING; ADVANCE GUARD; ARMY ORGANIZATION; REAR GUARD. The composition and operation of a column of ships in naval warfare or manœuvres will be found treated under TACTICS, NAVAL.

COLUM'NA ROSTRA'TA. A column set up in the Roman Forum to commemorate the naval victory of Gaius Duilius (q.v.) over the Carthaginians in 260 B.C. It was of marble, adorned with the prows of the captured ships; hence the name. The column having been destroyed by lightning, a new column was erected by Claudius, with an inscription found in the Forum in 1566 and now preserved in the palace of the Conservatori. Consult *Corpus Inscriptionum Latinarum*, vol. i (2d ed., 1893), and Allen, *Remnants of Early Latin*, pp. 67–68 (Boston, 1884).

COLUMN OF JULY. See JULY, COLUMN OF.

COLUMN OF MAR'CUS AURE'LIUS. See ANTONINE COLUMN.

COLUMN OF PHO'CAS. See PHOCAS, COLUMN OF.

COLUMN OF SAINT MARK. See VENICE.

COLUMN OF TRAJAN. See TRAJAN'S COLUMN.

COLUMNS OF HER'CULES. See HERCULES, PILLARS OF.

COLUMN VENDÔME, vän'dôm'. See VENDÔME, PLACE.

COLURE, kô-lūr' (Gk. *κόλος, kolos*, docked + *οὐρά, oura*, tail). One of the two great circles of the celestial sphere drawn through the celestial pole, and in one case the equinoxes, in the other the solstices. The colures divide both the ecliptic and the celestial equator into four equal parts. The solstitial colure also passes through the pole of the ecliptic.

COLVILLE, kōl'vĭl (from the town of Colville, Wash.). A former important Salishan people, calling themselves Shwoyelphi, or Senijextee, originally occupying the country on Columbia River about Colville and Kettle rivers, northeastern Washington. The great salmon-fishing resort of Kettle Falls was within their territory, and here, in 1846, was established the Jesuit mission of St. Paul, through the influence of which nearly all the upper Columbia tribes are now Christianized. They were put upon a reservation (Colville) in 1872 and numbered 785 in 1910. See SALISHAN STOCK.

COLVIN, kŏl'vĭn, SIR SIDNEY (1845–). An English critic of art and books, born at Norwood, Surrey. He graduated in 1867 at Trinity College, Cambridge, was elected a fellow of the college in 1868, and, having become Slade professor of fine arts at Cambridge in 1873, held that post by successive reëlections until 1885. In 1876–84 he was also director of the Fitzwilliam Museum of the university. He was keeper of prints and drawings in the British Museum from 1884 to 1912. His contributions to periodicals on the history and criticism of literature, and more largely of the fine arts, are numerous and valuable. He was knighted in 1911. His published works include the volumes on *Walter Savage Landor* (1881) and *John Keats* (1887) in the "English Men of Letters Series"; *A Florentine Picture-*

Chronicle (1898); *The Early History of Engraving in England* (1905); editions of *Selections from the Writings of Walter Savage Landor* (1882); of the *Letters of Keats* (1887) in the "Golden Treasury Series," and of the *Papers of Fleeming Jenkin* (1887; with J. A. Ewing); *Selected Drawings from Old Masters* (1903–10); *Early Engraving and Engravers in England* (1906); *Letters of Robert Louis Stevenson* (1911). His labors in connection with the preparation of the standard Edinburgh edition (27 vols., 1894–98) of the works, and of the edition of the collected *Letters* (2 vols., London, 1900; preceded in 1895 by *Vailima Letters*) of his friend, Robert Louis Stevenson, made him an authority on that author. He also wrote the sketch of Stevenson for the *Dictionary of National Biography* (vol. liv), and was to have written the authoritative *Life*, intended for publication with the *Letters*, but was obliged to relinquish the task to Graham Balfour.

COL'VOCORESSES, George Partridge (1847–). An American naval officer, born at Norwich, Vt. After serving two years in the Civil War on the ships *Supply* and *Saratoga*, he attended the United States Naval Academy, where he graduated in 1869. He was promoted through the various grades, becoming captain in 1905 and retiring as rear admiral in 1907. During the Spanish-American War he took part in the battle of Manila Bay. He was instructor at the Naval Academy in 1886–90 and in 1893–96, and was commandant of midshipmen in 1905–07.

COL'WELL, Stephen (1800–72). An American author and philanthropist, born in Brooke Co., West Va. He graduated at Jefferson College, Pa., in 1819; was admitted to the bar of Virginia in 1821; and practiced in Pittsburgh until 1831, when he engaged in the iron business in Philadelphia and began writing for the press, particularly on questions of politics and social science. He gathered a large library, which he left to the University of Pennsylvania, where he also endowed a chair in social science. During the Civil War he was an active supporter of the Union and at its close was appointed a commissioner to revise the internal-revenue system. Besides contributions to commercial and financial periodicals, he published: *Politics for American Christians* (1852); *Position of Christianity in the United States in its Relation with our Political System and Religious Instruction in the Public Schools* (1855); *Effects of Disunion on Slavery* (1856); *The Ways and Means of Commercial Payment* (1858).

CO'LY. See Mouse Bird.

COLYN. See Colins.

COL'ZA, or Coleseed. See Rape.

CO'MA (Neo-Lat., from Gk. *κῶμα, kōma*, deep sleep, from *κοιμᾶν, koiman*, to put to sleep, from *κεῖσθαι, keisthai*, to lie; connected with Lat. *quies*, rest). A state of profound insensibility differing from natural sleep in that the patient cannot be aroused from the stupor. The patient's eyes are closed, his pupils are either large or small, his face is generally flushed and the conjunctivæ red, the breathing deep, labored, and stertorous. The different varieties of coma which the physician is called upon to distinguish are as follows: Coma due to drugs, e.g., alcohol, opium, belladonna, chloral; poisoning from illuminating gas, ptomaines, uremia, and diabetes; unconsciousness from nervous diseases, such as epilepsy and hysteria; or from brain lesions, as apoplexy, tumors or abscess of the brain, concussion, meningitis. There remain also to be mentioned voluntary coma (feigning, malingering) and transient coma, or syncope. In the coma from opium or morphine the patient should be aroused if possible and kept walking and awake by various means; but in coma from all other causes he should be kept absolutely quiet in bed. Therefore it is very necessary to know exactly what trouble must be treated, and no layman can judge of the proper remedial measures. The coma from alcoholic intoxication is so frequent and well known that very often the coma of serious conditions is mistaken for mere drunkenness.

Coma Vigil. A condition of continuous sleeplessness, associated with partial unconsciousness, occurring towards the end of a severe attack of diseases, such as typhus or typhoid fever, or delirium tremens.

CO'MA BER'ENI'CES (Lat., Berenice's hair). A small northern constellation said to have been named in honor of Berenice, the wife of Ptolemy Euergetes, but first delimited by Tycho Brahe. It lies to the south of the tail of the Great Bear and very near the equinoctial colure (q.v.). It consists of a small cluster of stars which has been the subject of careful measurement with the heliometer by Chase at the Yale Observatory, and photographically by Kretz, at Columbia University, New York. See Conon of Samos.

COMACCHIO, kō-mäk'kyō (Lat. *Comaculum*). A town in the Valli di Commachio, Province of Ferrara, in northeast Italy, situated on the southernmost of the lagoons of the Po, 3 miles from the Adriatic (Map: Italy, G 3). It is built on 13 islands that are connected by numerous bridges, and the lagoon communicates with the little port of Magnavacca, on the Adriatic. It is the seat of a bishopric, has ancient walls and an old cathedral. It was formerly an important fortress. The majority of the inhabitants are engaged in fishing for eels for the market and in the manufacture of salt. Pop. (commune), 1881, 9974; 1901, 10,877, 1911, 12,052.

CO'MAN, Katharine (1857–1915). An American economist and educator, born in Newark, Ohio. She graduated at the University of Michigan in 1880, and was professor of history (1883–1900) and then of economics at Wellesley College. Her writings, of which the most important are on economic history, include: *The Growth of the English Nation* (1894); *History of England* (1899); *English History as told by English Poets* (1902; with Katharine Lee Bates); *Industrial History of the United States* (1905, revised 1911); *Economic Beginnings of the Far West* (1912).

COMA'NA (Lat., from Gk. Κόμανα, *Komana*). 1. Comana of Cappadocia, an ancient city, situated in a deep valley of the Anti-Taurus Range, through which the river Sarus flows. It is probably identical with the Kumani of Tiglathpileser I (c.1140–1105 B.C.) and the Kammanu of Sargon II (722–705 B.C.). Comana was celebrated as the place where the rites of the goddess Ma (the Greek Enyo, or Artemis, and the Roman Bellona) were celebrated with much solemnity and great magnificence, in a spacious and sumptuous temple, to which the city was

scarcely more than an appendage. It was governed by the chief priest, who took rank next to the King. In Strabo's time more than 6000 persons are said to have been engaged in the temple affairs. The festivals attracted large gatherings. It has been suggested by Th. Reinach (*Mithridate Eupator*, 1890, p. 242) that the early development of this cult was to some extent influenced by the Cimmerians (q.v.) in the seventh century B.C. John Chrysostom died in Comana on his way from Cucusus to Pityus on the Euxine, whither he had been banished. 2. COMANA IN PONTUS, an ancient city of Asia Minor, on the river Iris, the modern Tocat-su. It was an important commercial city, and the seat of the worship of the goddess of the moon, whose cult was carried on with ceremonies analogous to those employed in the Cappadocian Comana (see above). Its ruins are still to be seen near the village of Gumenek.

COMANCHE, kō-măn'chē *or* kō-măn'chā (of unknown signification, first applied to the tribe by the Spanish Mexicans), an important tribe of Shoshonean stock, formerly ranging jointly with the Kiowa (q.v.), along the southern plains from the Arkansas River to central Texas, and extending their forays far down into Mexico. Up to the surrender of the last hostile band, in 1875, they were the constant scourge of the Mexican and Texan frontier. They are a southern offshoot of the Shoshoni proper, the language of the two tribes being the same. They are singularly deficient in religious ceremonials. They now number 1171, in western Oklahoma, their reservation having been thrown open to settlement in 1901. Consult *Handbook of American Indians* (Washington, 1907).

COMANCHE. A city and the county seat of Comanche Co., Tex., 112 miles southwest of Fort Worth, on the Fort Worth and Rio Grande and the St. Louis and Southwestern railroads (Map: Texas, C 4). It is in an agricultural region and has stockyards, brickworks, cotton gins and other establishments connected with the cotton industry. Comanche was settled in 1857 and is governed under a charter of 1876 which provides for a mayor, elected biennially, and a unicameral council. The water works are owned by the city. Pop., 1900, 2070; 1910, 2756.

COMAN'CHEAN SERIES. A division of the Cretaceous system of rocks, including all of the Lower Cretaceous beds as developed in the southern interior section of the United States and the adjoining parts of Mexico. The series is made up of three subordinate stages (*a*) Trinity, (*b*) Fredericksburg, and (*c*) Washita; the first, or Trinity, stage largely consists of sands, but the later ones are largely limestone or chalk. The beds are exposed over an extensive area in Texas, Oklahoma, and Mexico, reaching a thickness of 1000 feet or more in Texas and over 10,000 feet in Mexico. They contain lignitic coal and some bitumen. The Comanchean is given the rank of a system by some American geologists who employ the name to designate all of the strata hitherto classed as Lower Cretaceous; the Cretaceous system would then include only the part that has usually been designated as Upper Cretaceous. Consult Chamberlin and Salisbury, *Geology*, vol. iii (New York, 1907). See CRETACEOUS SYSTEM.

COMAYAGUA, kō'mä-yä'gwä. The capital of the department of the same name, Honduras, near the Río Ulua, 37 miles northwest of Tegucigalpa (Map: Central America, D 3). It is situated in a fertile valley, but has little trade. It is an episcopal see, and the cathedral, dating from the early eighteenth century, is the most notable building. Pop., about 3000. Comayagua appears first in history, under the name "Valladolid la Nueva," about the middle of the sixteenth century, and Indian relics found in the vicinity testify to its antiquity. Until 1880 it was the capital of the republic.

COMB (AS. *camb*, Icel. *kambr*. OHG. *chamb*, Ger. *Kamm*, comb; connected with Gk. *γόμφος*, *gomphos*, peg, OChurch Slav. *zadŭ*, Skt. *jambha*, tooth). Combs seem to have been used by the ancients rather for adjusting than for fastening the hair, the pin, or bodkin (*acus*), having chiefly been employed for the latter purpose. Both the Greek and Roman combs were generally made of boxwood, obtained from the shores of the Euxine; but later, ivory combs, which had long been used by the Egyptians, came into general use among the Romans. The precious metals were also used for this purpose, but this was probably rarer in ancient than in modern and mediæval times, from the circumstance of the comb not having then been used as an ornamental fastening. Of the early use of gold combs in Great Britain we have a reminder in the well-known ballad of "Sir Patrick Spens":

> "O lang, lang may their ladyes sit,
> Wi' their gowd kames in their hair."

Combs have been found in Anglo-Saxon graves of both men and women. In early times the comb had a place in the church service. Careful ritualistic directions have been found for combing the abbot's hair in the sacristy before vespers and other services. In the tombs of the martyrs in the catacombs combs of ivory and boxwood have been found, which testify to this ancient custom of the priests arranging their hair before the altar.

An ancient Irish long rack comb is in the museum of the Royal Irish Academy. The sides are hogbacked, and between them are set the pectinated portions, varying in breadth from half an inch to an inch and a quarter, according to the size of the bone out of which they were cut. The whole is fastened together with brass pins riveted. By this contrivance any damaged portion could easily be replaced.

Modern combs are made with automatic machinery from tortoise shell, ivory, horn, wood, bone, metal, india rubber, and celluloid. The material is first made into plates of the size, shape, and thickness of the comb, and then the teeth are cut. In the case of horn, a material which is becoming rarer, the horn must be cleaned and slit, heated and flattened, and sawed into strips. The edges and ends are then trimmed, and the blanks are finished; the last stage in this preliminary process being hydraulic pressing. The old method of cutting the teeth was by the *stadda*, or double saw, which had two blades of steel set parallel to each other, with a space between them equal to the thickness of the intended tooth. Combs with 50 or 60 teeth to the inch may be cut in this manner. The teeth are then thinned, smoothed, and finished by means of thin, wedge-shaped files.

By the older process of cutting, above described, the material corresponding to the spaces between the teeth is of course wasted; by the method of parting this is made available to form the teeth of a second comb. The plate of horn, tortoise shell, etc., in a modern comb-cutting machine is cut through with plungers

carrying at their lower ends cutters which cut the teeth of two combs at a time. The essential features of the cutter consist of two thin chisels inclined to each other, which represent the edges; between these, and connecting the ends, is a small cross chisel. When this compound cutter descends with sufficient force upon the plate, it will cut one of the teeth. By simple machinery the table carrying the plate is made to advance a distance equal to the thickness of one tooth while the cutter is rising, and thus the successive cuts are made. A slight pull is now sufficient to part the plate into two combs, the teeth of which only require filing and finishing. India-rubber combs are manufactured by pressing the caoutchouc to the required form in molds and "vulcanizing" or combining it with sulphur afterward. By this means a high degree of hardness can be obtained. Celluloid combs may be also molded, but a process similar to that used with horn is preferable. In making celluloid combs the teeth may be either sawed or else the combs may be twinned or parted as described above, or formed with other automatic machinery in which the entire process from the blanks may be carried on to the finishing stage. In 1905 combs to the value of $2,769,380 were produced in the United States by 42 establishments, with a capital of $1,112,260, giving employment to 1806 wage earners. For the manufacture of horn combs and the machinery used therein, consult Viall, "The Manufacture of Horn Combs," *American Machinist*, vol. xxxv, p. 740 (New York, 1911). For the manufacture of celluloid combs, consult Masselon, Roberts, and Cillard, *Celluloid*, Eng. trans. by Hodgson (London, 1912).

COMB, or **COOMB.** An old British corn measure, containing four bushels. In many localities hollows or valleys among hills are called "combs," or "coombs."

COMBA, kōm'bȧ, Emilio (1839–1904). An Italian writer, born at San Germano Chisone. As professor at the Istituto Valdese at Florence, he founded in 1873 the review entitled *Rivista Cristiana*, somewhat polemical in nature, devoted to a discussion of religious topics. The history of religious reform in Italy is well described in the interesting works entitled *Introduzione alla storia della riforma in Italia* (1881) *and I nostri protestanti* (1895–97). The *Storia dei Valdesi* (new ed., 1901) was translated into English by T. E. Comba (London, 1889).

COMBARELLES, Cavern of. See Paleolithic Period.

COM'BAT (Fr., from *combattre*, to fight, from Lat. *com-*, together + ML. *battere*, to fight, from Lat. *batuere*, to beat), Single. Among the early Norsemen a careful distinction was made between the ordinary single combat, or *einvígi*, and the *hólm-ganga*, or island duel. The former was unencumbered with rules and traditions and was a simple fight between two opponents. The other, which received its name from the fact that it was always held on the *hólm*, or island, generally of a river, was accompanied by very elaborate rites and rules and could be engaged in only under certain circumstances, to be determined by the authorities. It was regarded as a sort of court of final appeal, and at the meeting of every Parliament, or *Thing*, a place for the holding of these official duels was set aside. Many old Norse warriors were famous as fighters of hólms, some even receiving nicknames from this circumstance. The hólm was abolished by the Icelandic Parliament, about 1006, probably as the result of the recent establishment of a new court of appeal, which made it unnecessary. The hólm continued in Norway for a few years longer. Some connection may exist between the hólm and the Norman tournaments, and the modern duel, with its formal procedure, represents the same idea in an unofficial form. Consult Baigt, *Der gerichtliche Zweikampf nach seinem Ursprung und in Rolandslied in romanische Forschungen*, pp. 436–498 (1890), and Below, *Der Ursprung des Duells* (Freiburg, 1898).

COMBE, kōm, George (1788–1858). A Scottish phrenologist, born in Edinburgh. He entered the legal profession, became a writer to the signet in 1812, and continued to practice until 1837, when he resolved to devote himself to scientific pursuits. He published his *Essays on Phrenology* in 1819 (renamed in later editions *System of Phrenology*), and in 1828 *The Constitution of Man Considered in Relation to External Objects*. Combe contributed largely to the *Phrenological Journal* (20 vols., 1824–47). Besides the works mentioned, he wrote on ethics, education, politics, economics, and theology. He also traveled in America and Germany, and published *Notes on the United States of North America* (3 vols., 1841). In his day his writings were popular, but they have no importance now. For his *Life*, consult Gibbon (London, 1878).

COMBE, William (1741–1823). An English author. He was born at Bristol and was educated at Eton and at Oxford, which he left without a degree. After rapidly spending a small fortune that had been left him, he settled in London as a law student and hack writer. In 1776 he published his *"Diaboliad*, a poem dedicated to the worst man in his Majesty's dominions." By his pen he earned a precarious living, and spent a good deal of his time in prison. He wrote upward of 200 biographical sketches, 70-odd sermons, many satires in doggerel, and an immense number of magazine articles. His most famous work, however, is *Three Tours of Dr. Syntax* (1812–21), written in verse, and illustrated by Rowlandson. It is a comic account, of still undiminished humorous appeal, of the adventures of a pedagogue. Consult Hotten, *The Three Tours*, edited with a bibliography (London, 1869).

COMBE CAPELLE SKELETON. See Man, Ancient Types.

COM'BERMERE, Stapleton Cotton, Viscount (1773–1865). An English soldier. He was born at Llewenny Hall, Denbighshire, and, after serving in several campaigns in India and South Africa, joined the army in Spain, where he greatly distinguished himself, rising to the command of the entire cavalry of the allied forces. He was commander in chief of the army in Ireland from 1822 to 1825 and was then sent in the same capacity to India, where he remained for five years, during part of this time acting as Governor-General. In recognition of his distinguished services he received the title of viscount, and in 1855 was made field marshal. He had succeeded to the family baronetcy in 1809. He was constable of the Tower (1852) after Wellington. A few years after his death an equestrian statue by Marochetti was erected to his memory at Chester Castle. Consult *The Combermere Correspondence*, edited by his widow and W. W. Knollys (London, 1866).

COMBES, kôNb, François (1816–90). A French scholar and historian, born at Alby. He became professor of history at the College of Pamiers in 1844, at the Collège Stanislas in Paris, 1848, at the Lycée Bonaparte in 1853, and in the Bordeaux faculty of letters in 1860. He published: *Histoire générale de la diplomatie européenne* (1854); *Histoire de la diplomatie slave et scandinave* (1856); *Histoire des invasions germaniques en France* (1873); *Lectures historiques à la Sorbonne et à l'Institut* (1884–85); and an edition of the French correspondence of John de Witt (1873).

COMBES, Justin Louis Emile (1833–1921). A French politician, born at Roquecourbe in the Department of Tarn. He at first studied for the priesthood, but later he decided to become a physician instead. After completing his medical course he settled down as a country doctor in the little town of Pons in the Department of Charente-Inférieure. His interest in politics sprang from his interest in public hygiene and education. He was elected mayor of Pons in 1875, then a member of the Conseil-Général of the department in 1879, finally a senator in 1885, an office which he still held in 1914. M. Combes became a prominent leader of the Radical Republican party and was given the portfolio of Minister of Education in the Bourgeois cabinet of 1895. In 1903 he succeeded Waldeck-Rousseau as Premier, himself taking the portfolio of the Interior. It was during the Combes ministry that the war on the church, which had been started by Waldeck-Rousseau, was carried on with unflinching firmness. The law against the religious orders was enforced with great severity, and over 500 teaching, preaching, and commercial orders were suppressed under the Combes régime. The Premier was relentless in his opposition to these associations, which he regarded as "pernicious instruments of that monstrous theocratic doctrine which is fatal to our whole social and political conception, of which the fundamental axiom is the absolute independence of the state of all dogma, and its recognized supremacy over every religious communion." During the Combes ministry steps were also taken which were to lead later to the separation of church and state. In spite of the fact that M. Combes was upheld by the Chamber in all his acts, he resigned in 1905 because of the intense bitterness which these acts aroused among the conservatives.

M. Combes is a latter-day Voltairean, with all of his master's hatred of clericalism in all its forms. To him the Catholic church appears as the sworn enemy of modern life and culture and particularly of the Republic of France. M. Combes is therefore a statesman of one idea, anti-clericalism, for he has taken deeply to heart Gambetta's famous injunction, *Le cléricalisme, voilà l'ennemi.* Personally he is what is called in France an "austere Republican," a man simple in his private life and absolutely rigid in his adherence to the principles of the French Revolution.

COM'BINA'TION. See Permutation.

COMBINATION (ML. *combinatio,* from Lat. *combinare,* to combine, from *com-,* together + *bini,* two by two). In law, specifically the union of individuals or corporations for the promotion of their common business interests. When limited to this object, and kept free from fraud, violence, or like sinister methods, it does not fall under the ban of modern law. If it is resorted to, however, for the accomplishment of an unlawful end, it becomes a conspiracy (q.v.) and subjects its promoters to civil actions for damages as well as to criminal prosecution. Formerly combinations to raise or depress prices, as well as every form of combination in restraint of trade, were treated as conspiracies by English law.

Whether combinations by laborers to raise wages were conspiracies at common law is a question upon which the highest authorities in England differ. If not at common law, they were criminal conspiracies under a series of statutes beginning with 23 Edw. III in 1349 and closing with 40 Geo. III, c. 60, in 1800. A radical change in legislation on this topic in England began in 1825, and at present combinations of workingmen in labor organizations (q.v.) and similar associations are sanctioned by law, both in Great Britain and the United States, provided they are not accompanied by fraudulent, violent, or menacing conduct, or by boycotting or similar unlawful practices. See Conspiracy; Boycott; Intimidation; Trade-Unions; Strike.

Combinations of skill and capital, within proper bounds, have always received legal recognition; such as the combinations effected in a partnership, joint-stock association, or corporation. At present the tendency to extend these combinations and to introduce new or modified forms is very marked. Trade-unions (q.v.) among workingmen, and trusts (q.v.) among capitalists, may serve as illustrations. The legislation relating to these forms of combination, as well as their economic and political bearings, will be dealt with under the appropriate titles.

COMBING. See Carding.

COMBUSTION (Lat. *combustio,* a burning, from *comburere,* to burn, probably for **comurere,* but with *b* inserted on the analogy of *ambustus,* burned; less plausibly for **co-amb-urere,* to burn, from *com-,* together + amb, ambi, Gk. *ἀμφί, amphi,* around + *urere,* to burn), or Burning. The process by which bodies combine with oxygen and are thus seemingly destroyed. The term is, in ordinary parlance, restricted to cases in which the process of combination takes place rapidly and is accompanied by heat and light, as the combustion of wood in a fireplace, the combustion of a candle, etc. In its more scientific usage, however, the term may designate any possible case of direct combination with oxygen, whether rapid or slow, whether accompanied by light or not. By analogy, the term is also sometimes applied to the rapid union of substances with "supporters of combustion" other than oxygen, such as chlorine gas, in which a candle may burn almost as well as in air.

The light and heat of combustion are utilized for purposes of everyday life, the combustible material employed, i.e., the illuminant or the fuel, being usually some product containing carbon. Thus ordinary illuminating gas contains a number of gaseous chemical compounds of carbon. Coal and wood are mixtures of carbon compounds, the former containing even a considerable amount of free carbon. Hydrogen, too, is one of the chemical constituents of most fuels and illuminants. When combustion takes place, the carbon and hydrogen, combining with oxygen, give, respectively, carbonic-acid gas (carbon dioxide) and water vapor. These are,

therefore, the chief products of ordinary combustion.

The heat (measured in gram calories or in kilojoules, as explained in the article CHEMISTRY) that may be obtained by burning a given amount (say, the molecular weight in grams) of a substance, depends on the nature of the substance, on its state of aggregation and temperature (usually 18° C.) before the combustion, and the temperature (usually again 18° C.) of the cooled products of the combustion. All these conditions taken into consideration, every combustible chemical substance has its own characteristic "heat of combustion." The following are the heats of combustion of a few well-known compounds of carbon: ordinary alcohol, 340,000 gram calories; acetic acid (the sour principle of vinegar), 210,000; ethyl-acetic ester, 544,000; cane sugar, 1,355,000; cellulose, 680,000; urea, 152,000. The combustion of a chemical compound may be conceived as taking place in two consecutive steps: first, the compound is decomposed, i.e., every one of its molecules is broken up into its constituent atoms—a process usually involving not evolution, but *absorption* of heat; secondly, every single atom capable of so doing combines with oxygen (O) an atom of carbon (C), thus yielding a molecule of carbonic acid (CO_2), and two atoms of hydrogen (H) yielding a molecule of water (H_2O). This second step of the process is accompanied by the evolution of a quantity of heat depending upon the number of carbon and hydrogen atoms in a molecule of the combustible compound. But, owing to the absorption taking place during the first part of the process, a portion only of the heat produced during the second part actually appears in the form of sensible heat, and it is that portion which is called the heat of combustion. An exact knowledge of the heats of combustion of various substances is of great importance for theoretical as well as for immediate practical purposes. Its practical importance in comparing, e.g., different kinds of fuel, is self-evident and requires no explanation. Its theoretical importance is mainly in the fact that with the aid of it the exact amount of heat evolved or absorbed during various chemical transformations can be readily calculated. According to the first law of thermodynamics, the amount of heat evolved or absorbed during any transformation whatever, is independent of the manner in which the transformation takes place. For example, the amount of heat produced by burning one equivalent weight of ordinary alcohol and one equivalent weight of acetic acid, is the same whether we burn them directly or first cause them to combine into ethyl-acetic ester and then burn the latter. In the second case the heat absorbed during the formation of the ester must, of course, be combined with that evolved during its combustion. But this suggests a simple way of obtaining the heat of formation of the ester by merely carrying out two combustions. The total heat of combustion of free alcohol and acetic acid is 340,000 + 210,000 = 550,000 gram calories (see above); that of ethyl-acetic ester is 554,000 gram calories. The excess of 4000 gram calories must therefore represent the amount absorbed during the combination of alcohol and the acid into ethyl-acetic ester. In a similar manner the heat of any chemical reaction may be determined, if the heats of combustion of the reacting substances and the heats of combustion of the products of the reaction are known. In many cases this is the only certain way of determining with some precision the heat of reactions, as direct measurement during a reaction would often involve very great experimental difficulties, while the direct measurement of the heat of combustion is a comparatively simple matter. The heat of combustion is usually determined by chemists in the following manner: A known amount of the combustible substance is inclosed in an air-tight steel vessel filled with compressed oxygen and lined on the inside with platinum; the vessel is immersed in a calorimeter (see CALORIMETRY), and the substance is ignited with the aid of an iron wire heated by means of an electric current; the observer measures the rise of temperature in the calorimeter, and from this calculates the amount of heat produced. The importance of knowing the heat of chemical reactions is discussed in the article THERMOCHEMISTRY (q.v.).

Now, while the heat of combustion depends only on the chemical nature of the material burned, the rise of temperature caused by it depends to a very great extent on the manner in which the combustion takes place. If other gases, such as the nitrogen of the air, are present without themselves adding to the amount of heat produced, part of that amount goes to heat such gases, and, as a result, the temperature is considerably lower than if the same substance were burned in precisely the amount of oxygen gas required for its combustion. The rapidity with which a combustion takes place is another factor on which the temperature depends; for heat may be gradually dissipated by conduction even while it is being produced, and so the actual amount remaining at any moment during a slow process of combustion may be very small. Thus, when phosphorus is exposed to the air at ordinary temperatures, a slow process of oxidation (combustion) takes place, very little heat being given out at any given moment. If ignited in the air, phosphorus burns vividly, giving out much heat and light for a short time. Finally, if ignited in an atmosphere of pure oxygen, it enters into most vivid combustion, evolving for a very short time a most intense heat and a brilliant light. An analogous phenomenon may be observed when coal is burned in a furnace. So long as the door of the furnace is open and there is but little draft through the fuel, the evolution of heat is moderate and may last several hours. But when the door is shut and much air is drawn through the coal, the latter is more quickly burned; the temperature is higher because more heat is evolved during a shorter period of time, but in the long run the amount of heat produced is the same.

Since the process of combustion is a form of chemical transformation more striking and more commonly met with than any other process, it early attracted the attention of scientific observers. But since, on the other hand, it involves the consumption and formation of gases, it baffled their ingenuity for many centuries. Those light, colorless, aëriform substances had, in the first place, to be discovered; and for a long time they escaped the attention of observers, in spite of their being present everywhere and constantly interfering with experimental work. Further, the peculiar properties of gases, together with the striking appearance

of flames and fires, gave birth to the erroneous idea that material bodies are capable of losing weight by combining with certain "principles" and of gaining weight by having such "principles" taken away from them. Thus the phenomena of combustion long hampered the progress of science. But it was the same phenomena that also finally led to truer conceptions; for their correct interpretation by Lavoisier formed the corner stone upon which rests the gigantic structure of the chemistry of to-day. See FOOD; FUEL; THERMOCHEMISTRY; CHEMISTRY; SPONTANEOUS and SURFACE COMBUSTION.

COMÉDIE FRANÇAISE, kô'mâ'dê' frän'sâz' (Fr., French comedy). The official name of the Théâtre Français, the national theatre of France, subsidized by the state for the advancement of dramatic art. Its history dates officially from Oct. 21, 1680, when a decree of Louis XIV amalgamated the two rival companies of the Hôtel de Bourgogne and the Hôtel Guénégaud, the latter being a fusion, after Molière's death in 1673, of the Théâtre du Marais and the Troupe de Molière. It thus maintains a practically unbroken tradition from the time of the great master of comedy and is still familiarly known as the House of Molière. In 1682 the King granted to his comedians an annual pension of 12,000 livres (about $2400), their first subsidy. In 1689 they established themselves in a new house, in what is now called the "Rue de l'Ancienne Comédie," and took the name of "La Comédie Française"; under it they played until the Revolution with a succession of such artists as Baron, Adrienne Lecouvreur, Le Kain, and Mademoiselle Clairon. For a time (1770–82) they were housed in the palace of the Tuileries itself. Later, on the performance of Chénier's antimonarchical play of *Charles IX* in 1789, violent political discussions arose among the performers, and ultimately they split into two sections: the Republican party, under the young tragedian Talma, establishing a new theatre under the name "Théâtre de la République," on the site of the present building in the Rue de Richelieu; while the Royalist section took the title "Théâtre de la Nation." In September, 1793, the latter was suddenly closed by order of the Committee of Public Safety, and the players imprisoned, though they were afterward gradually released. For a few years the rivalry continued; then in 1799, for a short time, there was an absolute interruption in the history of the Théâtre Français. In May of that year, however, the Comédie was once more reorganized and settled in the Rue de Richelieu. Napoleon, while at Moscow, Oct. 15, 1812, prescribed the regulations which, modified in 1850 and 1859, still govern the company. There is an *administrateur-général* appointed by the government. The *sociétaires* are members of the company, who, as shareholders, divide the profits according to certain rules. Before being elected as a *sociétaire*, an artist must have served in the theatre as a *pensionnaire*, upon a salary. A *sociétaire*, after 20 years of service, is allowed to retire with a pension of 4000 francs. The annual sum received from the state is 240,000 francs; and the theatre, being removed from the fear of temporary pecuniary failure, is in no sense a mere business speculation, but serves as an educator of public taste and sets a standard of dramatic training. Here many of the greatest artists of the modern French stage have won their triumphs, including Mademoiselles Mars, Rachel, Brohan, and, for a part of her career, Sarah Bernhardt, and Monsieurs Talma, Got, Mounet-Sully, and Coquelin. Early in 1900 the historic building adjoining the Palais Royal was partly destroyed by a disastrous fire, but was promptly rebuilt in improved fashion within the same lines. Consult: Matthews, *The Theatres of Paris* (New York, 1880); Lucas, *Histoire philosophique et littéraire du Théâtre-Français* (Paris, 1862–63); Bonnassies, *La Comédie Française, histoire administrative* (ib., 1874); Joannides, *La Comédie Française 1680 à 1900, dictionnaire général des pièces et des auteurs*, preface by Jules Claretie (ib., 1901); Cochrane, *The Théâtre Français in the Reign of Louis XV* (London, 1879); and, for a discussion of many of the plays of its recent repertory, Weiss, *Autour de la Comédie Française* (Paris, 1892).

COMÉDIE HUMAINE, ü'mân' (Fr., human comedy). A series of novels by Honoré de Balzac, the first volume of which was published in 1829, but the general title of which was not announced until 1842. Its plan was to present a panorama of the entire life of his country and time. This colossal attempt was left incomplete on his death in 1850. But well-nigh 100 novels remain, dealing with innumerable types and situations characteristic of the France of the early nineteenth century.

COM'EDO MITE. See ACARUS FOLLICULORUM.

COMEDY. See DRAMA.

COMEDY OF ERRORS, THE. An early play of Shakespeare, acted at Gray's Inn, Dec. 28, 1594, and printed in 1623. It was probably suggested by the *Menæchmi* of Plautus. The plot revolves around the amusing blunders caused by the complete similarity, in person, of the twin brothers, Antipholus of Syracuse and Antipholus of Ephesus, and their twin servants, the Dromios, whom even their masters are not able to tell apart.

COME'NIUS, or KOMENSKY, JOHANN AMOS (1592–1670). A noted educational reformer of the seventeenth century, born either at or near Ungarisch-Brod, Moravia. His parents belonged to the Moravian Brethren, and Comenius became one of the leaders of that sect. Though on account of poverty he was unable to begin his education until late—he did not enter the Latin school at Strassnick until he was 16—he attended the gymnasium of Herborn, in Nassau, and later studied at Heidelberg. In the course of his study he became acquainted with the educational reforms of Ratichius (q.v.), and with the report of these reforms issued by the universities of Jena and Giessen.

The work of Comenius included three important fields of activity. His practical work, constituting throughout his life his most immediate concern, was that connected with the Moravian church. In 1614 he was ordained to its ministry, and four years later was given the charge at Fulnek, one of the most flourishing churches of that communion. In consequence of the religious wars he lost all his property and his writings in 1621, and six years later was compelled to flee from his native country on account of the proscription of all Protestants. Settling at Lissa, in Poland, he became director of the gymnasium there and was given charge of the Bohemian and Moravian churches. In 1641 he went to England to join a commission charged with the reform of the system of public education, but the

disturbed political condition of the country interfered with his project. In the following year, at the invitation of Oxenstiern, he applied himself to the task of reorganizing the Swedish schools. He elaborated his plans at Elbing, West Prussia, where he settled in 1642. In 1648 he was elected Bishop of the Moravian Brethren at Lissa, which town he made once more his residence, and where he published a number of his philological works. He subsequently visited Transylvania and in 1650 assisted in drawing up a plan for reforming the Protestant school of Sáros-Patak, Hungary. In 1654 he returned to Lissa; but in the war which soon after raged in Poland he once more lost all his property, including his manuscripts, and was compelled to flee (1657). He traveled through Silesia and Brandenburg, visited Stettin and Hamburg, and finally settled at Amsterdam, where he died.

Through all his wanderings and all his educational activities, Comenius' religious interests were cared for to the neglect of many of his great educational plans. The somewhat mystical bent of his mind, however, led the gifted reformer into extremes that render much of his writings valueless for modern times and in his last years made him an easy dupe of religious impostors.

His second great interest was in furthering the Baconian attempt at the organization of all human knowledge. He became one of the leaders in the encyclopædic or pansophic movement of the seventeenth century, and, in fact, was inclined to sacrifice his more practical educational interests and opportunities for these more imposing but somewhat visionary projects. The men of affairs who aided him with funds and gave him protection and opportunity for continuing his educational investigations and writings were more interested in their immediate practical import, and insisted, in spite of the wishes of Comenius, on his devoting his energies and original insight to the work of organizing schools and writing textbooks or works on method. In 1639 Comenius had published his *Pansophiæ Prodromus*, and in the following year his English friend Hartlib published, without his consent, the plan of the pansophic work as outlined by Comenius. The result of his life's work in this sphere, his *Pansophia*, was destroyed in manuscript in the burning of his home in Lissa in 1657. The pansophic ideas find partial expression in the series of textbooks produced from time to time. In these he attempts to organize the entire field of human knowledge so as to bring it, in outline, within the grasp of every child.

The most permanent influence exerted by Comenius was in practical educational work. Few men since his day have had a greater influence, though for the greater part of the eighteenth century and the early part of the nineteenth there was little recognition of his relationship to the current advance in educational thought and practice. The practical educational influence of Comenius was threefold. He was first a teacher and an organizer of schools, not only among his own people, but later in Sweden and to a slight extent in Holland. In his *Great Didactic* he outlines a system of schools that is the exact counterpart of the existing American system of kindergarten, elementary school, secondary school, college, and university. In the second place, the influence of Comenius was in formulating the general theory of education. In this respect he is the forerunner of Rousseau, Pestalozzi, Froebel, etc., and is the first to formulate that idea of "education according to nature," so influential during the latter part of the eighteenth and early part of the nineteenth century. The influence of Comenius on educational thought is comparable with that of his contemporaries, Bacon and Descartes, on science and philosophy. In fact, he was largely influenced by the thought of these two; and his importance is largely due to the fact that he first applied or attempted to apply in a systematic manner the principles of thought and of investigation, newly formulated by those philosophers, to the organization of education in all its aspects. The summary of this attempt is given in the *Didactica Magna*, completed about 1631, though not published until several years later. The third aspect of his educational influence was that on the subject matter and method of education, exerted through a series of textbooks of an entirely new nature. The first published of these was the *Janua Linguarum Reserata* ('The Gate of Languages Unlocked'), issued in 1631. This was followed later by a more elementary text, the *Vestibulum*, and a more advanced one, the *Atrium*, and other texts. In 1657 was published the *Orbis Sensualium Pictus*, probably the most renowned and most widely circulated of school textbooks. It was also the first successful application of illustrations to the work of teaching, though not, as often stated, the first illustrated book for children.

These texts were all based on the same fundamental ideas: (1) learning foreign languages through the vernacular; (2) obtaining ideas through objects rather than words; (3) starting with objects most familiar to the child to introduce him to both the new language and the more remote world of objects; (4) giving the child a comprehensive knowledge of his environment, physical and social, as well as instruction in religious, moral, and classical subjects; (5) making this acquisition of a compendium of knowledge a pleasure rather than a task; and (6) making instruction universal. While the formulation of many of these ideas is open to criticism from more recent points of view, and while the naturalistic conception of education is one based on crude analogies, the importance of the Comenian influence in education has now been recognized for half a century. The educational writings of Comenius comprise more than 40 titles. In 1892 the three-hundredth anniversary of Comenius was very generally celebrated by educators, and at that time the Comenian Society for the study and publication of his works was formed. Consult: Keatinge, *The Great Didactic of Comenius* (London, 1896); Laurie, *John Amos Comenius, Bishop of the Moravians: His Life and Educational Works* (ib., 1884); Quick, *Essays on Educational Reformers* (ib., 1890); Müller, *Comenius, ein Systematiker in der Pädagogik* (Dresden, 1887); Löscher, *Comenius, der Pädagog und Bischof* (Leipzig, 1889); Monroe, *Comenius and the Beginning of Educational Reform* (New York, 1900).

CO'MES (Lat. *comes*, comrade). A title of honor among the Romans. See COUNT.

COMET (AS., Lat. *cometa*, comet, from Gk. *κομήτης*, *komētēs*, having long hair, from *κομᾶν*, *koman*, to wear long hair, from *κόμη*, *komē*,

hair). The word "comet" had its origin in the hairy appearance often exhibited by the haze or luminous vapors, the presence of which is at first sight the most striking characteristic of the celestial bodies called by this name. The general features of a comet are: a definite point or nucleus, a nebulous light surrounding the nucleus, and a luminous train preceding or following it. Anciently, when a train preceded the nucleus—as is the case when a comet has passed its perihelion and recedes from the sun—it was called "the beard," being termed "the tail" when seen following the nucleus as the sun is approached. This distinction has disappeared from all modern astronomical works, and the latter name is given to the appendage, whatever its apparent position. Neither this luminous attendant, the tail, nor the nucleus, is now considered an essential cometary element, but all bodies in the solar system are classed as comets if they have a motion of their own and describe orbits of an extremely elongated form. There are several plain points of difference between comets and planets. The planets move in the same direction, from west to east, which is astronomically called "direct motion"; but the movements of comets are often from east to west, or retrograde. The orbits of all the planets are confined to a zone of no great breadth on either side of the ecliptic; but the paths of comets cut the ecliptic in every direction, some being almost perpendicular to it. The orbits of all the planets are nearly circular; or, more properly speaking, are ellipses of very small eccentricity. The orbits of comets, on the other hand, present great variety of eccentricity, many of them being ellipses or elongated closed orbits of various degrees of elongation; others, though very rarely, may be hyperbolas; while the majority have a form of orbit not differing sensibly from the parabola, which is the limiting form of curve to which both the ellipse and hyperbola usually approximate. Any attraction, however, of an extraneous body, like a planet, interfering with the attraction of the sun, might change the orbit from the ellipse to the hyperbola, and vice versa, or from the parabola to either. As, however, there is only one parabola corresponding to infinite sets of ellipses and hyperbolas, an interfering cause is not likely to change the orbit from an ellipse or hyperbola to a parabola. Of about 400 comets whose orbits have been obtained with more or less accuracy, 90 appear to describe elliptic orbits and are therefore probably periodical. Of the rest, about 300 orbits cannot be distinguished from parabolas, though many may in reality be ellipses, for the ellipse, when very eccentric, cannot near perihelion be distinguished from a parabola; and in six or seven cases the hyperbolic form of orbit is extremely probable. The discovery that comets are celestial bodies extraneous to our atmosphere is due to Tycho Brahe, who ascertained the fact by observations of the comet of 1577. Newton succeeded in demonstrating that their movements are subject to the same law which controls the planets in their orbits. Halley was the first, by determining the parabolic elements of a number of comets from recorded observations, to identify the comet of 1682 with one which had been observed in 1607 and with one observed by Apian at Ingolstadt in 1531, and thus confidently to predict the return, at the end of 1758 or the beginning of 1759, of a comet which would have the same parabolic elements. This prediction of the first "periodic" comet moving in a closed oval orbit simply meant that the portion of the closed orbit lying nearest the sun, and therefore the only observable portion of the orbit, would very closely resemble the parabolas or open curves in which this comet had been supposed to be moving at its earlier appearances.

For the determination of a parabolic orbit, five elements (q.v.) are necessary: (1) The inclination of the orbit to the ecliptic; (2) the longitude of the ascending node; (3) the longitude of the perihelion, or point of nearest approach of the sun; (4) the perihelion distance, or nearness of approach to the sun; (5) the date of perihelion passage. The first two of these elements determine the plane of the orbit. To determine these parabolic elements, three observations of the comet are sufficient; and by a table of such elements, calculated from recorded observations, it is possible at once to ascertain, as Halley did, whether any newly observed comet is identical with any that has been previously observed. However, to predict with accuracy the time of the return of a comet, a much more accurate calculation must be made of the orbit, taking into account the perturbations of the planets to whose influence it is subject. This difficult problem was solved, in the case of Halley's comet, by the joint work of Lalande, Madame Lepaute, and Clairaut, who announced in November, 1758, just as astronomers began to look out for the return of the comet, that it would take 618 days more to return to the perihelion than on the preceding revolution. The perihelion passage was fixed about the middle of April, 1759; but Clairaut distinctly stated that, being pressed for time, he had neglected small values which collectively might amount to about a month in the 76 years. The comet passed the perihelion on March 12, 1759, exactly a month before the time announced, but within the assigned limits of divergence from that date. The elements of its orbit proclaimed it to be the comet of the former appearances by their similarity. For the next perihelion passage, the different calculations executed by Damoiseau and De Pontécoulant fixed the 4th, the 7th, and the 13th of November, 1835. Subsequently observations indicated the 16th—i.e., a deviation of only three days from what turned out the most accurate calculation, and a deviation of 12 days from the most remote. Its last return to perihelion in 1910 was the occasion of a still more striking triumph of computational astronomy. In anticipation of its reappearance, Cowell and Crommelin instituted a series of researches into its past history and computed the effects of the planetary perturbations on its orbit with such success that, when it was first detected by Prof. Max Wolf, of Heidelberg, on Sept. 11, 1909, its predicted right ascension was found to be only eight seconds in error, while its observed declination was in exact agreement with that predicted. We have adverted to the perihelion passages of this comet in 1531, 1607, 1682, 1759, and 1835. Its earlier returns were traced back to 12 B.C. by Hind, who identified it at each appearance with some notable comet recorded in Chinese or European annals. The more careful researches of Cowell and Crommelin corrected several of Hind's identifications and carried the history of the comet back to the year 240 B.C. The recorded returns of Halley's comet, with

the dates of perihelion passage as computed by them, are given below:

B.C.	240, May 15	A.D.	912, July 20
	163, May 20		989, Oct. 9
	87, Aug. 15		1066, Mar. 27
	12, Oct. 8		1145, Apr. 6
A.D.	66, Jan. 26		1222, Sept. 10
	141, Mar. 25		1301, Oct. 22
	218, Apr. 6		1378, Nov. 8
	295, Apr. 7		1456, June 8
	373, Nov. 17		1531, Aug. 25
	451, July 3		1607, Oct. 26
	530, Nov. 15		1682, Sept. 14
	607, Mar. 26		1759, Mar. 12
	684, Nov. 26		1835, Nov. 15
	760, June 15		1910, Apr. 19
	837, Feb. 25		

There are in all about 40 comets whose periodicity is established by the fact that their return has been actually observed. The principal periodic comets, with their periods and the dates of their last-observed perihelion passages, are given below:

Name	Period in years	Last observed perihelion passage
Encke	3.30	Aug. 24, 1911
Tempel II	5.28	Nov. 10, 1904
Brorsen	5.46	March 30, 1879
Tempel-Swift	5.68	Oct. 4, 1908
Winnecke	5.89	Oct. 9, 1909
De Vico-Swift	6.40	April 27, 1901
Spitaler	6.40	Oct. 26, 1890
Giacobini	6.44	Nov. 2, 1913
Baenard	6.52	Dec. 10, 1892
Perrine	6.53	Oct. 31, 1909
Tempel I	6.54	Oct. 4, 1898
D'Arrest	6.55	Sept. 16, 1910
Finlay	6.56	Feb. 17, 1900
Biela	6.62	Sept. 23, 1852
Wolf	6.82	Feb. 11, 1912
Holmes	6.86	March 14, 1906
Brooks	7.10	Jan. 8, 1911
Borrelly	7.20	Dec. 18, 1911
Faye	7.41	Nov. 1, 1910
Denning II	7.42	Feb. 10, 1894
Denning I	8.69	Sept. 13, 1881
Tuttle	13.67	Oct. 28, 1912
Stephen	40.09	Jan. 20, 1867
Westphal	61.12	Nov. 26, 1913
Pons-Brooks	71.56	Jan. 26, 1884
Olbers	72.65	Oct. 9, 1887
Halley	76.00	April 19, 1910

Biela's comet (q.v.) is now lost. Another comet which has not been seen lately, though it has been due to appear at least four times since 1879, is that of Brorsen. In 1881, shortly after its last appearance, its orbit intersected that of Denning's comet II near the orbit of Jupiter, and it is supposed that the perturbations which it experienced at that time have radically changed both its orbit and its period.

In June, 1770, Messier discovered a comet which remained visible a long time and enabled Lexell to ascertain the orbit to be an ellipse whose major axis was only three times the diameter of the earth's orbit and corresponded to a periodic revolution of five and one-half years. This result suggested grave difficulties. It had been found impossible to identify this comet with any previously observed, and yet it was difficult to conceive that a bright comet with so short a period of return should have previously escaped observation. What was still more remarkable, it was never seen again, though anxiously looked for in the places where Lexell's orbit would have brought it. It became popularly called "Lexell's lost comet" and gave occasion to many sarcasms by the wits of the day at the expense of astronomers, who had boasted of having found the key to the cometary movements. In the present day the explanation is complete. The comet was never seen before 1770, because its orbit previously had been totally different, its nearest point to the sun having been as distant as the path of Jupiter. Its appearance that year arose out of the fact that in 1767 it was in such close contact with Jupiter, moving in the same direction and nearly in the same plane, that the attraction of that planet entirely changed its orbit. But why has the comet not since been seen? Its passage to the point of perihelion in 1776 took place by day; and in 1779, before another return, it again encountered the vast body of Jupiter and suffered a fresh orbital derangement—the attraction of the planet deflecting it into more distant regions and so changing the form of the orbit that if it had again been visible it would probably not have been recognized as identical with Lexell's comet.

The celebrated comet of 1680, which furnished Newton with the occasion for proving that comets revolve around the sun in conic sections, and that, consequently, they are retained in their orbits by the same force as that which regulates the movements of the planets, appears to have been about the most remarkable for brilliancy of any of which we have authentic accounts. This comet is supposed to be identical with the one that appeared about the time of Cæsar's death (44 B.C.), with that which was seen in the reign of Justinian in the year 531, and with another in the year 1106, in the reign of Henry II; the period of revolution, according to the orbit calculated by Whiston, being about 575 years. In the nineteenth century the comets most remarkable for brilliancy were the comets of 1811, 1843, 1858 (Donati's), 1861, 1880, 1881, and the great comet of 1882. Spectroscopic investigation, so far as yet pursued, points to the conclusion that comets are self-luminous and do not shine merely by reflecting solar light. It has been discovered, in determining the tracks of those streams of dark bodies that cause meteoric showers, that some of the tracks coincide with the orbits of well-known comets. From this it is inferred that star showers and comets may be only different manifestations of the same thing. (See METEORS.) What the matter of the comets consists of is, of course, only a subject for speculation. The composition of the nebulosity and the tail is, at all events, something of almost inconceivable tenuity, as shown by three considerations: 1. Stars seen through them suffer no diminution of brightness, though the light must have to traverse sometimes millions of miles of the cometary atmosphere. 2. Though the thickness of the tail of a comet may be millions of miles, and its length of course much greater, the comets have never been observed to cause any sensible disturbance of the planetary motions, though approaching near enough to be themselves so much affected as to change the entire character of the orbit. 3. The curvature of the tails, and the acceleration of the periodic time in the case of Encke's comet, indicate the possibility of their being affected by a resisting medium, which has never been observed to have the slightest influence on the planetary periods, though so long observed. Even the nuclei of comets appear to be of extremely small density. This may be inferred, though with less force than regards the tails, from the two last considerations above mentioned; and, moreover, there are reliable ac-

counts of stars of a very low order of magnitude being seen through the nuclei themselves.

Instead of pointing to the sun in obedience to the law of gravitation, the tail of a comet is always directed from it and frequently assumes a curved form. It increases in length with its proximity to the sun, but does not acquire its greatest length till perihelion is passed. To explain this phenomenon, Olbers suggested that the sun was the seat of a repulsive force, which was probably electrical in its nature. This theory for a long time gained acceptance, supported as it was by Bredikhine's division of cometary appendages into three classes, according to the nature and the density of the matter composing them. According to Bredikhine, the long straight tails, as seen in the comet of 1861, are composed of hydrogen; the long curved tails, like the principal tail of Donati's comet, consist largely of hydrocarbon vapors; while the somnolent, rare, short tails of violent curvature are made up of mixed iron, sodium, and other metallic vapors. This classification has received some support from spectroscopic evidence. In 1882 Fitzgerald first propounded the theory that the tail was due to the pressure of light upon the gaseous matter composing it; but the small amount of the pressure, as calculated on his assumptions, proved an obstacle to the acceptance of the theory. In 1900 Arrhenius revived the theory, but modified it to the extent of supposing the tail to consist, not of gaseous matter, but of fine particles produced by condensation from the emanations of the comet. The light-pressure theory received confirmation in 1901 from the experiments of Nichols and Hull in America and of Lebedew in Russia.

Much speculation has been devoted to the question of the origin of comets, and several theories have been advanced to account for them. According to one theory, they are wandering bodies which travel through space from star to star; according to another, they are composed of matter which has been violently ejected from the stars during the periods of convulsion to which, arguing from the analogy of the sun, they must from time to time be subject. In any case some of these bodies occasionally visit the solar system, and if one should chance to pass close to one of the larger planets, it may have its velocity retarded to such an extent that its parabolic orbit becomes changed to an ellipse, and in consequence the comet becomes permanently retained as a member of the sun's family. By this "capture theory," which was first suggested by Laplace, the existence of the families of comets which are associated with the four outer planets is accounted for. The members of these families describe elliptic orbits the aphelion points of which lie near the orbits of one or other of the planets Jupiter, Saturn, Uranus, and Neptune. The largest of these planetary families is that which is associated with Jupiter and numbers about 30. They are all comets of short period, ranging from that of Encke's comet, viz., three and three-tenths years, to about nine years. Neptune has a family of six long-period comets, four of which, viz., those of Westphal, Pons, Olbers, and Halley, have been observed at a second reappearance; the other two, which appeared in 1846 and 1847, are expected to return in 1921 and 1927 respectively. The families associated with Saturn and Uranus are small, consisting of two and three members respectively. Besides these planetary families, there are also several well-defined groups of comets which pursue nearly identical paths and appear to have been derived from some common source in space. The most remarkable of these groups consists of the great comets of 1668, 1843, 1880, and 1882, together with a much smaller one which appeared in 1887. All five came to the sun from the direction of Sirius and are supposed to have been separated from a single parent mass by the attraction of the sun, their perihelion passages together with the major axes of their orbits, and consequently their periods, having been variously determined by the special perturbations to which each has doubtless been subject, while the remaining elements of the orbits remain virtually identical.

Comets have been alternately regarded with terror and with welcome in the popular mind. Perhaps the two most famous appearances of Halley's comet were those of 1066 and 1456. In the former year it caused universal consternation throughout Europe and was looked upon as a presage of the success of the Norman invasion of England. One celebrated record of its appearance at that time is to be seen in the Bayeux Tapestry, which is said to have been worked by Queen Matilda, the wife of William the Conqueror, and her ladies. The appearance of the comet in 1456, three years after the Turks had become masters of Constantinople, and just as they were threatening an advance into Europe, was regarded by Christendom with a superstitious dread, and to the Ave Maria was added the prayer: "Lord save us from the devil, the Turk, and the comet." At Constantinople the occurrence of a lunar eclipse at the same time increased the portentousness of the event. The discoveries of science as to the magnitude of the space filled by the bodies of comets and their prodigious velocity, together with the confessed impossibility of always predicting their approach, produced fears of another kind, which have sometimes been, especially in France, extravagantly exaggerated in the public mind. Consult: Guillemin, *The World of Comets* (London, 1881); Zöllner, *Ueber die Natur der Kometen* (Leipzig, 1883); Marcuse, *Ueber die physische Beschaffenheit der Kometen* (Berlin, 1884); Ball, *In the Starry Realm* (London, 1892); Galle, *Verzeichnis der Elemente der bisher berechneten Kometenbahnen bis zum Century* (ib., 1908); Chambers, *The Story of the Heavens* (New York, 1900); Bryant, *History of Astronomy* (London, 1907); Clerke, *Popular History of Astronomy during the Nineteenth Century* (ib., 1908); Chambers, *The Story of the Comets* (Oxford, 1909); Lynn, *Remarkable Comets* (London, 1910).

COMET SEEKER. A telescope having a wide field of view, but a rather low magnifying power, used in searching for comets.

CO'MEY, Arthur Messinger (1861–). An American chemist, born in Boston, and educated at Harvard University and the University of Heidelberg. In 1885–89 he was instructor in chemistry at Harvard and in 1889–93 professor of chemistry at Tufts College. He was engaged as an analytical and consulting chemist in Boston from 1893 to 1906, when he became director of the Eastern Laboratory of the E. I. du Pont de Nemours Powder Company. He is author of the *Dictionary of Chemical Solubilities* (1896).

COMFORT, kŭm'fẽrt, George Fisk (1833–1910). An American educator. He was born

at Berkshire, N. Y., and graduated at Wesleyan University in 1857. He was one of the leaders in organizing the American Philological Association (1869) and also in establishing the Metropolitan Museum of Art in New York City (1869–72). From 1872 to 1887 he was professor of modern languages and æsthetics in Syracuse University and in 1872 founded there the College of Fine Arts, of which he was dean from 1873 until 1893. In the latter year he became president of the Southern College of Fine Arts, at La Porte, Tex., and in 1896 organized the Syracuse Museum of Fine Arts, of which he became the director. He published: *Art Museums in America* (1869); *Modern Languages in Education* (1886); *Woman's Education and Woman's Health* (1894); *The Land Troubles in Ireland* (1898); and a series of German textbooks.

COMFREY, kŭm'frĭ (OF. *cumfirie, confire,* from ML. *confirma,* probably on account of its strengthening powers, from Lat. *confirmare,* to make firm, strengthen, from *con-,* together + *firmare,* to strengthen, from *firmus,* firm), *Symphytum.* A genus of plants of the family Boraginaceæ. The species, about 20 in number, are natives of Europe, northern Africa, and western Asia. They are perennial plants of coarse appearance, although occasionally to be seen in flower borders. *Symphytum officinale* (the common comfrey) and *Symphytum tuberosum* are natives of Great Britain, frequent in shady and moist places. *Symphytum officinale* was formerly much esteemed as a vulnerary, on account of its astringency, and decoctions of its roots were a household remedy for diarrhœa. Its young leaves and its blanched shoots are also occasionally used as boiled vegetables. The prickly comfrey (*Symphytum asperrimum*), a native of Caucasus, 6 to 10 feet in height, has been highly recommended for feeding cattle. It has been extensively tried in the United States, but its cultivation is not recommended, except when a large bulk of forage is required from a limited area of rich land. It is propagated from roots. *Symphytum asperrimum* and *Symphytum officinale* have become naturalized in the United States.

COM'ICAL GALLANT', THE, or THE AMOURS OF SIR JOHN FALSTAFF. An adaptation, by John Dennis (1702), of Shakespeare's *Merry Wives of Windsor.*

COMICAL LOVERS, THE, or MARRIAGE À LA MODE. A comedy by Colley Cibber (1707), based on portions of Dryden's *Secret Love* and *Marriage à la Mode.*

COMICAL REVENGE, THE, or LOVE IN A TUB. A comedy by Sir George Etherege, played and printed in 1664.

COMINES, kô'mĕn', or **COMMINES** (Lat. *Cominæus,* Flemish *Comen*). A border town of France and Belgium, situated on the Lys, by which it is divided into two parts, one belonging to the French Department of Nord and the other to the Belgian Province of West Flanders (Map: Belgium, B 4). It has a number of textile mills and tobacco factories and manufactures cutlery. It has a belfry of the fourteenth century and a ruined castle. The celebrated mediæval chronicler, Philippe de Commines (see COMMINES), was born here. Pop., French portion, 1901, 8129; 1911, 8575; Belgian, 1900, 5957; 1910, 6641.

COMISO, kô-mē'sô. A city in Sicily, in the Province of Syracuse, situated about 13 miles west of Ragusa. It is 800 feet above the sea (Map: Italy, J 11). It was known in Roman mythology as the location of a fabled fountain of Diana, the water of which, when drawn by women of impure character, refused to mingle with wine. It is on the road between Catania and Licata and has two churches, a theatre, and cotton, earthenware, and soap factories. Pop. (commune), 1881, 19,333; 1901, 21,873; 1911, 26,624.

COMITÁN, kō'mē-tän', or **COMITLÁN.** A town in the State of Chiapas, Mexico, situated on the Grijalva River, about 30 miles southeast of San Cristóbal (Map: Mexico, N 9). It has a fine Dominican cloister. The town is largely engaged in agriculture and cattle raising, but has manufactures of cotton and woolen goods, liquors, etc., and carries on a contraband trade with Guatemala and British Honduras. Comitán suffered considerably from the raids of Juan Ortega in 1855–64. Pop., 1900, 9316; 1910, 10,196.

COMITIA, kô-mĭsh'ĭ-ȧ (Lat. nom. pl., assemblies, from *com-* (*con-*), together + *ire,* to go). The formal legal or constitutional meetings of the whole Roman people, convoked by a magistrate, for the purpose of voting. The comitia are thus distinguished from *concilia,* a term strictly applicable to assemblies of any sort, but used especially of assemblies of a part of the people, and *contiones,* gatherings for receiving communications and hearing addresses only, not for voting. It was always a fundamental principle of the Roman constitution that the supreme power was inherent in the citizens, though it might be delegated by them to hereditary or to elected magistrates. All important matters, however, had to be brought before the sovereign people, who could either ratify or reject proposals, though without discussion. Such, at least in theory—and, during the best days of the Republic, in practice also—was the function of the popular assemblies. Under the force of circumstances, from time to time innovations materially altered the position of the two political parties—the patricians and the plebeians. Nowhere can the progress of the struggle between these factions be more clearly traced than in the history of the assemblies, or comitia, by which the supreme authority of Rome was wielded. It is usual to describe the Roman comitia as of three kinds—the Comitia Curiata, or assembly of the curiæ; the Comitia Centuriata, or assembly of the centuries; and the Comitia Tributa, or assembly of the tribes.

1. **Comitia Curiata.** This assembly, that of the curiæ (see CURIA), is believed to have been coeval with the rise of Rome itself. At first the curiæ were probably made up exclusively of the freeholders, or patricians (q.v.), as the freeholders were afterward designated, on whom devolved exclusively the right and the duty of bearing arms. Later, plebeians were included. In the Comitia Curiata each Curia voted as a unit, according to the will of the majority of its members. The purely political importance of the Comitia Curiata declined after the political distinctions between patricians and plebeians terminated; its powers passed largely to the two other kinds of Comitia. It retained, however, to a late period its original powers over the transference of a patrician to the plebeian order and the admission of nonpatricians to patrician standing. It passed also the *lex curiata,* which

was necessary that the higher magistrates might legally have *imperium*, i.e., the executive authority essential to the proper discharge of their official duties. The Comitia Curiata was also summoned, down to late times, to witness the making of wills, or the renunciation of the *sacra* of a gens, as in adoption, or to inaugurate flamens (q.v.) and the *rex sacrorum*. It was then styled *comitia calata*, and was presided over by the Pontifex Maximus. By Cicero's time the Comitia Curiata was represented at meetings by lictors only, 30 in number.

2. **Comitia Centuriata.** As the plebeians (q.v.) increased, a reform of the constitution became necessary, which, we may well conceive, was hastened by the gradual thinning of the ranks of the old freeholders in incessant wars. The plebeians were exempt from service in the field; hence, while their political inferiority must have been galling, their immunity from the chances of war can hardly have been looked upon with equanimity by the patricians (q.v.). It was to redress this twofold grievance that the reform ascribed to King Servius Tullius (q.v.) is generally believed to have been effected. (See also, under ROME, *History of Rome during the Earliest or Regal Period.*) But the whole scheme was one skillfully devised to assign duties to the plebeians rather than to give them rights, and it was evidently the work of a statesman who was acting in the interest of the patricians. The chief authorities for the details of the arrangement are Livy and Dionysius, whose accounts, though they differ in some particulars, agree in the main. Both of them, however, describe the assembly of the centuries rather as it existed in their own day than as it was first constituted. Livy gives the whole number of the centuries, as arranged by Servius, as 194; Dionysius, as 193. The voting was by centuries, each possessing a collective vote, exactly as in the case of the curiæ in the Comitia Curiata. The 18 centuries of *equites* and the 80 centuries of the first class voted first. If they were agreed upon a question, the other centuries were not called upon to vote at all. As the centuries, though nominally "hundreds," probably contained in the first class fewer, and in some of the other classes certainly many times more, than that number, it is plain that in the Comitia Centuriata by far the largest share of power was retained in the hands of the wealthy, of whom the original burgess element would long form the main portion. In any case, the reform of Servius was originally a new military rather than a new political organization, its author intending that the privileges of the patricians assembled in the curiæ should remain as before. But, by a process easily understood, the rights of the curiæ gradually passed to the centuries, and the Comitia Centuriata became thenceforth the chief guardian of the rights of the Roman people as a whole. In later times the number of centuries in the Comitia Centuriata was increased to 373. How the centuries were arranged for voting purposes is a moot question, for which reference may be made to the exhaustive discussion by Botsford, *The Roman Assemblies*, pp. 212–228, and to the literature there cited. Only a magistrate who possessed *imperium* could preside over the Comitia Centuriata. It elected the magistrates who had *imperium* and also the censors; the right of declaring war was vested in it alone. So too it had sole jurisdiction in capital cases. Its legislative powers, which it had wrested from the Comitia Curiata, it surrendered to the Comitia Tributa.

3. **Comitia Tributa.** The tribunes of the people, now the acknowledged leaders of the democracy, took advantage of an ancient division of the original territory of Rome into tribes to establish an assembly democratic in fact, and not merely in appearance (as was the Comitia Centuriata). The tribes, 30, and afterward 35, in number, the leaders of the people succeeded at length, as early as 471 B.C., in forming into a political union entitled to exercise certain functions, chief among which was the election of the inferior magistrates, the approval and rejection of such legislative measures as affected the interests of the plebeians as a class, and the presentation to the Comitia Centuriata, through the consul, of petitions on behalf of the plebeians. At first, then, resolutions passed by the Comitia Tributa had moral force only, not legal; later, by enactments of 449 B.C. and 339 B.C. they had full force of law. In the later Republic laws were usually enacted by the Comitia Tributa. It elected the tribunes of the people and all other plebeian officials. The assembly of the tribes at first included both plebeians and patricians; later it seems to have consisted of plebeians alone. Under the first emperors the form of calling the assemblies together was still observed; but the people met no longer to control their chief ruler, but simply to receive his reports; elections to office had by this time been transferred to the Senate. Consult: Mommsen, *Römische Forschungen*, vol. i (Berlin, 1879), and *Römisches Staatsrecht* (3d ed., Leipzig, 1887); Greenidge, *Roman Public Life* (London, 1901); Abbott, *Roman Political Institutions* (Boston, 1901); Pauly-Wissowa, *Real-Encyclopädie der classischen Altertumswissenschaft*, vol. iv (Stuttgart, 1900); Botsford, *The Roman Assemblies* (New York, 1909).

COMITIUM, kō-mĭsh'ĭ-ŭm (Lat., place of assembly). A small square in ancient Rome, in the Forum, south of the Senate House. It was originally the polling place of Rome, where the Comitia (q.v.) met. It contained the old rostra, and near by was the Græcostasis, or platform for foreign ambassadors awaiting admission to the Senate. In or near the Comitium stood a number of statues, including those of the Augur Attus Navius, Pythagoras, Alcibiades, and Horatius Cocles, and the Ficus Ruminalis. Consult Platner, *The Topography and Monuments of Ancient Rome* (New York, 1911).

COMITLÁN. See COMITÁN.

COM'ITY OF NATIONS. That species of international legal courtesy by which the laws and institutions of one country are recognized and given effect to by those of another. It is often called by its Latin equivalent, *comitas gentium*. "In the silence of any positive rule," says Mr. Justice Story, "affirming, or denying, or restraining the operation of foreign laws, courts of justice presume the tacit adoption of them by their own government, unless they are repugnant to its policy or prejudicial to its interests." From the existence of so great a number of independent states on the continent of Europe, and of federated states in America, the *comitas gentium* is more called into play in these countries than in England, and it has consequently been more extensively discussed by their legal writers. The principle of the comity of nations, which, as between sovereign states,

rests upon common consent and not upon positive law, has been embodied in the fundamental law of the United States by the provision of the Constitution (Art. IV, Sec. 1) that "Full faith and credit shall be given in each State to the public acts, records, and judicial proceedings of every other State." The apparent violation of this principle in the refusal of some States to recognize divorces granted in others comes under a well-recognized exception to the rule, to the effect that to be entitled to such recognition the act or judicial proceeding in question shall have been within the jurisdiction of the State or the court performing the act or rendering the judgment. See CONFLICT OF LAW; INTERNATIONAL LAW; and the authorities there referred to.

COMLY, SAMUEL PANCOAST (1849–1918). An American naval officer, born at Woodbury, N. J. After graduating from the United States Naval Academy, in 1869, he was promoted through the various grades, becoming captain in 1905 and rear admiral in 1909. In 1874 he was on the *Juaniata* in the *Polaris* search expedition to Greenland. In the Spanish-American War he was in the charge at San Juan, Porto Rico, and took part in the bombardment of Santiago and the destruction of Cervera's fleet. He commanded the *Alabama* in 1905–07, and was in command of the fourth division of the United States Atlantic Fleet in 1910, and later in the same year of the third division. He was retired in 1911.

COM'MA (Lat., Gk. *κόμμα, komma*, clause, piece, from *κόπτειν, koptein*, to strike). In the mathematical study of sound, in which tones are expressed in exact values by means of their vibration numbers, we find that, by reckoning upward in two different ways to a certain note, the two results show an infinitesimal difference in pitch. This minute interval, called a "comma," is only perceptible in theory and has no actual musical value in our modern "tempered" scale. By tuning upward four perfect fifths from a given note, and then two octaves and a major third from the same note, we reach apparently the same tone; but, calculating the vibrations, we find the first result exceeds the second in the proportion of 81 to 80. This difference is called the comma *syntonum*, or comma of Didymus. The difference obtained by tuning upward 12 fifths and seven octaves from a given tone is $\frac{531441}{524288}$, and is called the comma *ditonicum*, or comma of Pythagoras. These same figures result as the difference between six whole tones above a note and its octave.

COM'MA BACIL'LUS. See CHOLERA.

COMMA BUTTERFLY. A North American nymphaline butterfly (*Grapta*, or *Polygonia, comma*), one of the angle wings, reddish brown with darker spottings, and a light mark, shaped like a comma, on the hinder wing. It is widely distributed and common, feeding upon nettles, and is injurious to hops. See HOP INSECTS.

COM'MANDANT' (Fr. *commandant*, pres. part. of *commander*, to command, ML. *commandare*, to command, from Lat. *com*, together + *mandare*, to enjoin). A relative title, incident to a military command and applied to the commander of a garrison, fortified post, or military school without any regard to his absolute rank. The mounted service school at Fort Riley, Kans.; the Coast Artillery School at Fort Monroe, Va.; the United States Military Academy at West Point; Sandhurst, Hythe, and Kneller Hall, England, are all governed by officers of varying ranks, holding the local title of commandant.

In the United States navy the title of commandant is applied to the commanding officer of a navy yard or naval station. The commandants of the principal navy yards are line officers of the rank of rear admiral; lesser stations are commanded by captains or officers of less rank. To the commandant is given full jurisdiction over all vessels lying at the yard, and he is responsible for all building and repair work. He is also responsible for the proper organization of the working forces; for the effective organization of the yard force for protection against fire; and for the care and management of all machinery, equipment, etc., under his control. He is assisted by an officer of the rank of captain, or of less rank when the commandant is not a rear admiral, who acts as his executive officer and is called the *captain of the yard*. *Master Commandant* was formerly the title of officers in the United States navy next junior in rank to captains. In 1838 Congress enacted that *master commandants* should thereafter be known as and styled *commanders* (see COMMANDER); the latter title had previously been recognized in the pay bill of March 3, 1835. The title of master commandant was a relic of the days of transition from the time when the fighting on board ships was done by soldiers commanded by an officer of the land forces to that when the fighting and navigating forces were combined. The titles of *sailing master*, *master*, *master's mate*, etc., were evidently of pretransition origin; master commandant, on the contrary, was evidently a recognition of a new state of things in which the master mariner had become the *naval commander*.

COMMAND'ER. The title of officers of the United States and British navies next junior in rank to captains. In the United States navy it was established by law in 1838. (See COMMANDANT.) A commander may serve as commanding officer of a division, or of a ship of the second or third rate, or as executive officer of a ship of the first rate. The pay of a commander is $3500 per annum, with an addition of 10 per cent for each five years of service, provided the total amount does not exceed $4500; the pay on sea duty is 10 per cent more.

COMMANDER, LIEUTENANT. See LIEUTENANT COMMANDER.

COMMANDER, LYDIA KINGSMILL (MRS. HERBERT N. CASSON). An American lecturer and woman-suffrage leader, born at Clinton, Ontario, Canada. She was educated at the Collegiate Institute, Strafford, and at Western University, London (both in her native province), and at Meadville (Pa.) Theological School. In 1897 she was ordained a Congregational minister and became pastor of the Free Congregational Church, Baraboo, Wis. In the following year she joined the coöperative colony at Ruskin, Tenn., and also became associate editor of the *Coming Nation*. From 1899 to 1902 she was a member of the editorial staff of the New York *Journal*, and in the latter year she edited the *Bellamy Review* and *Fair Play*. After 1902 she engaged in lecturing and literary work, serving as official lecturer of the New York City Humane Society. She was also speaker at the International Congress of Women at Berlin in 1904 and at Toronto in 1909. She became known especially as a leader in intro-

ducing the more strenuous type of woman-suffrage propaganda in the United States. Besides magazine articles she is author of *Marred in the Making* (1903) and *The American Idea* (1907).

COMMANDER IN CHIEF. A relative military title, pertaining to an officer in supreme local military command, as commander in chief of the troops in the field. In the United States it is primarily the absolute rank and title attached to the office of President, and also the military title of many governors of States. Under the sixty-third article of the German Constitution of 1871, the Emperor is the supreme commander in chief of the army and navy. In England the rank, in its permanent sense, has been abolished, and an Army Council appointed, headed by the Secretary of State for War, who is responsible to the crown and to Parliament for the conduct of military affairs.

COMMANDER ISLANDS. A group of islands of the maritime territory of Siberia, situated in Bering Sea, east of Kamchatka, between lat. 54° 32′ and 55° 24′ N., and long. 165° 45′ and 168° 12′ E. (Map: Asia, Q 3). The group consists of the two large and inhabited islands of Bering (607 square miles) and Mednj (180 square miles) and two uninhabited islets. The climate is comparatively mild; but the inhabitants, descendants of Russians and Aleuts, are few in number. The Russian government protects the fur seal, for these islands and the American Pribiloff Islands are the sole remaining breeding grounds.

COMMANDER OF THE FAITHFUL (Ar. *'Amīr al-Mu'minīn*). A designation assumed by the Caliph Omar, the father-in-law of Mohammed, who conquered Syria, Phœnicia, Persia, Egypt, and Jerusalem, and "organized a complete military-religious commonwealth." The title was retained by his successors in the caliphate.

COMMAND'ERY. A regular assembly of Knights Templars. It confers the degrees of Knight of the Red Cross, Knight Templar, and Knight of Malta. The term was first applied, about 1260, to the property of military and religious orders, administered by members of those organizations, who were known as commanders. These had charge of the income of the estates belonging to the orders and had authority to receive gifts and alms. They were accountable to the Grand Commander, who, in the case of Knights of St. John of Jerusalem, resided at Jerusalem.

COMMANDING OFFICER. 1. The officer in actual command of a vessel of war. He is an officer of the line or executive corps, and is usually addressed by the courtesy title of "captain," without regard to actual rank, if he is permanently in command and not merely in temporary charge during the absence of a senior. The regular commanding officer, upon leaving the ship for a temporary absence, is succeeded by the next line officer in rank, but the latter must not alter the regulations established by his superior except in case of urgent necessity. Upon the commanding officer of a modern battleship there rests a responsibility the like of which is placed upon few men. He is answerable for the safety of the ship and of the crew, for the preservation of the battery, engines, boilers, and other machinery in condition for instant use, and for the conduct of all those placed under him, so far as he can control it. He is required to know every detail of construction of his ship and of her equipment as well as of the organization of the crew. He has as an assistant an executive officer, who has charge of the organization of the *personnel*, a first lieutenant who has charge of the hull and equipment; a navigating officer, who has charge of the navigation and navigating apparatus; an ordnance officer, who has charge of the guns and ordnance stores; a senior engineer, who has charge of the propelling and other machinery, including the electric plant; also a surgeon and a paymaster, the latter having charge of the accounts of the men and officers and of the provisions and clothing for the men. 2. In the military services throughout the world the senior officer of a regiment, corps, post, or any detachment where there is not any higher local military authority is regarded as the commanding officer. Regimentally the officer commanding the regiment is spoken of and referred to as the commanding officer.

COMMANDITE, kô'män'dêt', SOCIÉTÉ EN, or LIMITED PARTNERSHIP. See SOCIÉTÉ EN COMMANDITE.

COMMANDMENTS OF THE CHURCH. Certain rules imposed by the Roman Catholic church on all its members, under pain of grave sin. They number five or six, differing slightly in different countries; but in general they require the observance of Sundays and festivals of obligation by attendance at mass and rest from servile work, the observance of days of fasting and abstinence, the reception once a year at least of the sacraments of penance and holy communion, contribution in proportion to one's means to the support of pastors, and the observance of regulations in regard to marriage.

COMMELIN, kôm'lăn', HIERONYMUS. (?–c.1598). A Flemish printer, born at Douai. He worked at Geneva and later at Heidelberg. The best specimens of his press are the admirable editions of the ancient classics and the Church fathers, to the text of which, often determined by a collation of manuscripts, he added learned critical notes from his own hand.

COMMELIN, JAN (1629–92). A Dutch botanist, born in Amsterdam. He was a professor of botany in the University of Amsterdam and founded in that city the botanical gardens which soon became the most celebrated in Europe. In description of the contents of these gardens he wrote several volumes. He wrote: *Horti Medici Amstelodamensis Rariorum tam Orientalis quam Occidentalis Indiæ Plantarum Descriptio et Icones* (1697).

COMMEM'ORA'TION (Lat. *commemoratio*), or ENCÆNIA (Lat., Gk. *ἐγκαίνια, engkainia*, feast of renovation or consecration, a name for Easter). The great festival of the Oxford academic year, corresponding in some respects to the Commencement of American colleges. It usually takes place on the third Wednesday after Trinity Sunday, in the Sheldonian Theatre—which, like Sanders Theatre, Harvard, and the Kent Theatre, Chicago, is a university building. From time immemorial, public exercises have been held to mark the "act" or period when degrees were conferred on the members of the university. At the present day the proceedings consist of a Latin oration in honor of founders and benefactors (from which the name of the whole ceremony is derived); the conferring of degrees, not only in course, but

also *honoris causa*, on distinguished strangers, who are introduced to the vice chancellor in a short Latin speech; and the recitation, at least in part, of the Newdigate or English prize poem, and the Latin and English prize essays, the three prizes being the gift of the chancellor. The large area or floor is occupied during the proceedings by masters of arts and their male friends; in raised stalls in a semicircle around one end of this area sit the vice chancellor, doctors, and proctors; while the galleries are filled by the undergraduates and women. The undergraduates, until 1876, used to occupy a separate upper gallery; but the license claimed by them of making unofficial and often very witty comments on the proceedings—a survival of the privileges of the *Terræ Filius*, or licensed jester of mediæval times—finally reached a point where it was thought better to discourage it to some extent by breaking up the compact body of students and distributing them among the women present. Commemoration Day itself is only the culminating point of a week of gayety, marked by concerts, balls, theatrical representations, etc., which make Oxford a very attractive place to the visitor; but of late years the glories of this season have tended more and more to be eclipsed by those of the "Eights Week," when the college eight-oared races are rowed, early in May. See OXFORD UNIVERSITY.

COMMEMORATION ODE. An ode by James Russell Lowell, read at exercises held at Cambridge in 1865, in commemoration of the Harvard men who had served in the Civil War.

COMMENCE'MENT (OF., Fr. *commencement*, from OF. *comencer*, Fr. *commencer*, It. *cominciare*, to begin, from Lat. *con-*, together + *initiare*, to begin, from *initium*, beginning, from *inire*, to enter, from *in*, in + *ire*, to go). In American colleges, the name given to the concluding exercises of the college year, when degrees are conferred upon the bachelors, masters, and doctors completing their respective courses of study. The term is applied loosely to the graduating exercises of academies, secondary schools, etc. The custom originated in the mediæval universities, though the appropriate term was "inception." The inception involved two elements: (1) the recognition of the graduate or new teacher by his old master and other members of the profession; (2) the formal entrance of the newly licensed teacher upon his work by the actual performance of its duties. Hence an essential feature of the exercises was that the recipient of the bachelor's degree should "incept," or teach, and that the recipients of the higher degrees should defend a thesis. At Oxford this occasion was called Commemoration (q.v.); but at Cambridge it was, and is yet, called Commencement. The "inceptor" was there called "commencer," i.e., one who commenced teaching. The ceremony and the term were a part of the inheritance received by Harvard College from Cambridge University, and thus became general among American colleges. This exercise in Colonial days was held in the fall, at the commencement of the college year, and the term is often, though erroneously, supposed to refer to this fact. As the mediæval bachelor "incepted," or taught, the graduate of the American college delivered an oration or dissertation before receiving his degree. With the larger colleges even this modification of the old custom is now commonly abandoned, and in many places the Commencement exercises include only the address by the president or some distinguished educator and the conferring of degrees. See UNIVERSITY; DEGREE; COLLEGE; CURRICULUM.

COMMEN'DAM (ML., acc. sg. of *commenda*, trust, from Lat. *commendare*, to intrust, from *com-*, together + *mandare*, to intrust, from *manus*, hand + *dare*, to give; originally used in the phrases *in commendam dare*, to give in trust, or *in commendam mittere*, to send in trust). A term in ecclesiastical law to denote a benefice which, being void, is *commended* to the care of some sufficient clerk to be supplied until it may be conveniently provided with a pastor. In former times bishops frequently held livings *in commendam* in order to appropriate the revenues. The practice has well-nigh ceased in Europe and does not exist in the United States. In the Church of England commendams were abolished in 1836.

COM'MENDA'TION (Lat. *commendatio*, from *commendare*, to intrust). In feudal customs, the act by which a free man became a vassal. See FEUDALISM.

COMMENDATION OF OUR LADY, BALLADE IN. A ballad improperly attributed to Chaucer, according to Tyrwhitt; but really the same poem as the *Invocation of Our Lady*, ascribed to Lydgate.

COMMEN'SALISM (ML. *commensalis*, eating at the same table, from Lat. *com-*, together + *mensa*, table). A sort of partnership or association of two different kinds of organisms by which they endure each other's presence, do each other no harm, and in many cases are of mutual advantage; such are said to be commensals, or messmates. This occurs chiefly among marine invertebrates and is different from parasitism. Many commensals are quite free to separate, yet never dwell apart, and often could not maintain a separate existence. Others grow together so completely that they cannot separate if they would, yet are not parasites, because each retains its form and faculties, while a true parasite changes these in such a manner that it is no longer capable of obtaining food until it has been elaborated for it by the functions of its host. The most familiar example of commensalism is the small crab so often met with inside the shells of oysters—the pinnothere, or oyster crab. Similar crabs inhabit various bivalves the world over, to the mutual satisfaction of guest and host. Within the shelter of the mollusk's pearly house the little crab is safe from its enemies, yet can dash out whenever it observes any prey in the offing and bring it home to be devoured; and the crumbs may be welcome to the oyster. The most striking examples, perhaps, are found among cœlenterates and crustaceans. In the midst of the trailing tentacles, covered with stinging cells, of the Portuguese man-of-war and several jellyfishes, live small fishes, comparatively safe from pursuit of their foes; small fishes also seek refuge among the tentacles of sea anemones and within holothurians. Mollusks live in the burrows of sea urchins that move about in the sand and in the holes made by the crustaceous *Gebia*—a reversal of the oyster and crab.

Certain Dromia crabs carry sponges, ascidians, or sea anemones on their backs or claws. The anemones serve to conceal, and, by means of their nettling organs, protect the crab, while

they get fragments of the crab's food, or, by being transported from place to place, come in contact with more food than if they were stationary. One hermit crab (q.v.) always bears an anemone upon its claw, which is so placed that it blocks the entrance to the shell when the crab retreats within. If the anemone dies or is removed, the crab is at pains to find and transfer a new anemone to its claw. A still more curious case is that of a polyp (*Gemmaria americana*), found in deep water off the Newfoundland coast and allied to the sea anemones, which attaches itself to the shell of a kind of hermit crab, and by budding gradually covers the entire shell with a colony. "It possesses the power of dissolving the shell so that no trace of it can be found. As the polyp colony increases in size as fast as the crab grows, there is no need for the latter to change its abode, while its neighbors and competitors must frequently expose themselves to the discomforts and dangers of house hunting." Consult: Van Veneden, *Animal Parasites and Messmates* (New York, 1876); *Cambridge Natural History*, vol. iii (London, 1865); Semper, *Animal Life* (New York, 1881). For fishes as commensals, consult: Jordan and Evermann, *Fishes of North and Middle America*, pp. 924, 966 (Washington, 1900); Harrington, "On Nereids Commensal with Hermit Crabs," in *Transactions of New York Academy of Sciences*, vol. xvi (1897); for crustaceans, Calman, *The Life of Crustacea* (New York, 1911).

COMMEN'SURABLE (Lat. *commensurabilis*, from *com-*, together + *mensurare*, to measure, from *mensura*, measure, from *metiri*, to mete or measure). Two magnitudes which are of the same kind, and each of which contains a third magnitude an integral number of times, are said to be commensurable; e.g., a foot and a yard are commensurable, an inch or a foot being a common measure. The number 15 and 35 are commensurable, each being divisible by 5.

Magnitudes which have no common measure, i.e., are not multiples of the same unit, however small that unit is taken, are said to be incommensurable; e.g., the side and diagonal of a square are incommensurable. The diameter and circumference of a circle are incommensurable; 2 and $\sqrt{2}$, $\sqrt{5}$ and $\sqrt{7}$ are incommensurable. Numbers like $\sqrt{2}$, that are not commensurable with ordinary rational numbers, are also called incommensurable. In arithmetic, numbers prime to one another are sometimes said to be incommensurable with respect to one another, since they have no common measure except the unit of counting, which, used as a multiplier or divisor, does not change the number affected. See MULTIPLE; IRRATIONAL NUMBER.

COM'MENTARIES, CÆSAR'S. The title of the two extant works of Julius Cæsar, the account of the Gallic War (*De Bello Gallico*) and of the Civil War (*De Bello Civili*). The former is a concise narration of the author's campaigns in Gaul, published in 51 B.C., in seven books, to which an eighth book was added by Aulus Hirtius. The memoirs of the Civil War were afterward extended by other writers to embrace the Alexandrine, African, and Spanish wars. See COMMENTARII.

COMMENTARIES ON THE BIBLE. See EXEGESIS.

COMMENTARII, "Commentaries," a Latin term applied by the Romans to notes or memoranda, and then to record books of various sorts, such as the *Commentarii domestici*, or family memoirs; the accounts drawn up by men of distinction of events in which they had played a part (see COMMENTARIES, CÆSAR'S); the registers of municipal towns; the *Commentarii principis*, a register of accusations brought before the Emperor, and of his decisions in such cases; the *Commentarii pontificum, augurum*, and *decemvirorum*, collections of decrees and responses.

COMMENTRY, kō'mäN'trē'. A town in the Department of Allier, France, 8 miles southeast of Montluçon, on the Œil (Map: France, S., G 2). It stands in the centre of one of the most important coal fields of France, and since 1850 has risen from a mere village to a busy and populous town, whose inhabitants are mostly engaged in the coal mines and iron works. There are, besides, saw mills and manufactures of mirrors and cutlery. Pop., 1901, 11,169; 1911 (commune), 10,112.

COM'MER, FRANZ (1813–87). A German musician, born at Cologne, in which city he studied music with Leibl and Klein. After holding a position as organist of the Carmelite church there, he went to Berlin in 1832 to study with A. W. Bach, A. B. Marx, and Rungenhagen. He was *regens chori* at the Catholic Hedwigskirche; singing teacher at numerous schools, and founder (with Küster and Kullak), in 1844, of the Berlin Tonkünstlerverein. He was, in addition, royal music director and a senator of the Berlin Akademie. Together with Robert Eitner he founded in 1868 the Gesellschaft für Musikforschung, of which he was the first president. He edited a number of collections of old music and composed numerous masses, cantatas, and choruses.

COM'MERCE (Lat. *commercium*, commerce, interchange, from *com-*, together + *merx*, merchandise, from Lat. *merere*, to gain, Gk. *μέρος, meros*, share). In its general acceptation, a term denoting international traffic in goods, or what constitutes the foreign trade of all countries as distinguished from domestic trade. The first foreign merchants of whom we read, carrying goods and bags of silver from one region to another, were the Arabs, the reputed descendants of Ishmael and Esau. Their trade was by land. The first maritime carriers of goods were the Phœnicians, who dwelt on a narrow strip of land on the eastern shore of the Mediterranean, and were the founders of the great emporiums of Tyre and Sidon. The Phœnicians established an easier and securer passage between Egypt and Syria than had before been known. The corn and wine of the Nile, and the oil, silk, dyes, and spices of western Asia flowed through their hands. From carriers they became merchants, and to merchandise they added manufactures. They traversed the shores of the Mediterranean, established colonies in the Greek islands, and founded Carthage, one of the most noted commercial cities of the ancient world. The power of the Phœnicians disappeared with the rise of the Greek cities—Athens, Corinth—and of their colonies, of Carthage, and of Alexandria, the great seaport founded by Alexander the Great.

While Rome was giving laws and order to the half-civilized tribes of Italy, Carthage, operating on a different base and by other methods, was opening trade with less accessible parts of Europe. The strength of Rome was in her legions, but that of Carthage in her ships;

and her ships could reach realms where legions were powerless. Her mariners had passed the mysterious Pillars of Hercules into the Atlantic and established the port of Cadiz. They founded Carthagena and Barcelona and had depots and traders on the shores of Gaul. This prosperity of their commerce led to wars with Rome, which ended in 146 B.C. with the destruction of Carthage. In the same year the Romans captured and burned Corinth, which was then an important commercial city. In 273 A.D. land commerce suffered a disastrous blow, when Palmyra was in great part destroyed by the Romans.

Growth of Commerce. The repeated invasions of Italy by the Goths and Huns gave rise to the founding, for defense and for trade, of the city of Venice, about the middle of the fifth century—a city that for more than 1000 years stood foremost in the trade of the world. The Venetians traded with Constantinople, Greece, Syria, Egypt, India, and Arabia, and their vessels carried the products of the East to the ports of western Europe. They had possessions on the coast of Greece and became rulers in the Ionian Islands and in Cyprus. Their rivals, the Genoese, planted colonies on the shores of the Hellespont and the Black Sea, the most flourishing of which was Kaffa (the modern Feodosia), in the Crimea, a great emporium of the commerce between Europe and Asia. A vast commerce was carried on in the Middle Ages by the towns of the Hanseatic League, situated on the shores of the North Sea, and the Baltic, and the rivers flowing into them. When the chief objects of commerce were the skilled products of the East, the South German cities—Nuremberg and Augsburg—through which trade flowed inland, vied with Venice as centres of the Eastern trade. The ports of France and Spain were busy distributing centres. At the close of the Middle Ages Antwerp, having outstripped Bruges and Ghent, became the greatest mart in Christendom. The inventions and discoveries of the fifteenth century transferred the centres of trade successively to Lisbon, Amsterdam, and London. The mariner's compass made distant voyages possible on the open sea. By 1487 the Portuguese had explored the whole western coast of Africa, and in 1497 Vasco da Gama passed round the Cape of Good Hope, to land in India in the following year. Before the end of the century Columbus had thrice crossed the Atlantic, and Cabot, sent out by England, had discovered North America. Nearly all this daring enterprise had for its prime object the finding of some easy route to the fabulously wealthy East, to India and China. But a century elapsed before the English fixed their first establishment or factory in India. The discovery of the New World, however, was destined eventually to change the course and the nature of trade.

From such rapidly spreading exploration and colonization there necessarily arose new wants, new products, new manufactures, and rapidly increasing trade; interrupted more or less by wars, but in the main marching steadily and rapidly on. The nineteenth century witnessed an extension of the commercial relations of mankind to which there is no parallel in history. The history of commerce in the past century would be an epitome of the world's economic development during its most intense and active period, and any enumeration of the causes of the tremendous strides which commerce has made must be partial. The progress of colonization in the widest sense, and the improvement of the means of transportation, are primary factors which cannot be overlooked. In the nineteenth century the greater part of the North American continent was opened up to occupation, Australia and South Africa were peopled by men of white race, while large portions of Asia were brought under the influence of Western rule or Western ideas. This, together with the great increase of population in Europe, has greatly augmented the productive power and consuming power of widely distant parts of the earth, dependent upon commerce for the supply of their mutual wants. Application of steam to transportation alike by land and by water has intensified the progress of colonization as we have here used the term, and made possible the commerce which has resulted from it.

In 1819 the Atlantic Ocean was first crossed by a steam vessel, and regular transatlantic steam communication was inaugurated in 1838. Since then the increase of steam navigation has been rapid, particularly in the last 50 years, until now the greater part of maritime navigation is carried on by steamships. Their far greater bulk and greater speed have led to the gradual displacement of the old sailing ships and have greatly multiplied the potentialities of foreign commerce. The railway has been a factor of the greatest consequence in the development of sea-borne traffic. Before its advent it was only the produce of coast regions, or of those parts adjacent to inland waterways, which could participate in the foreign trade. But the railroad has utterly changed

YEARS	Imports	Exports	Combined Imports and Exports
1613	£2,141,151	£2,487,435	£4,628,586

IMPORTS AND EXPORTS

COUNTRIES	Imports	Exports
Argentina	$371,384,000	$463,578,000
Australia	371,825,000	310,792,000
Austria-Hungary	722,030,000	554,973,000
Belgium	899,472,000	753,001,000
Brasil	308,409,000	363,274,000
Canada	670,000,000	355,755,000
China	350,906,000	274,822,000
France	1,534,515,000	1,280,816,000
Germany	2,544,557,000	2,131,718,000
British India	522,389,000	784,503,000
Italy	695,592,000	462,456,000
Japan	307,844,000	261,258,000
Netherlands (1911)	1,332,874,000	1,090,848,000
Norway	135,671,000	87,084,000
Russia	532,768,000	734,905,000
Spain	189,020,000	188,966,000
Sweden	198,320,000	192,960,000
Switzerland	381,966,000	262,020,000
United Kingdom	3,080,022,000	2,371,073,000
United States	1,766,089,000	2,362,096,000

this condition. Of great importance, too, has been the influence of the telegraph in transmitting orders and other communications between distant points without loss of time. These developments have made it possible to transport long distances not only goods whose weight formerly debarred them from a place in foreign commerce, but also more perishable goods which, under the slower transportation of earlier days, could not be handled.

Some notion of the rapid development of commerce can be gained from the statement that the aggregate exports and imports of the United States, which in 1791 were $43,000,000, reached, in 1850, $318,000,000, and in the year ending Dec. 31, 1912, had reached a total of $4,129,000,000. For a comparison with earlier dates, we may select a few figures for Great Britain and Ireland, which show the development of commerce in the past 400 years, as shown in the first table on the preceding page.

World's Commerce. The aggregate commerce of the world was computed in 1890, for the total of exports and imports, at approximately $17,500,000,000. The foregoing statement, which gives the figures, so far as they are available, for the trade of 1912, gives some notion of the relative positions occupied by some of the leading nations, as shown by the second table on the preceding page.

Commerce of the United States. Turning now more especially to the commerce of the United States in recent years, we present a few figures showing the origin and destination of imports and exports, and the character of the goods imported. In the following table the figures for 1895, the year showing the smallest trade of the last decade of the nineteenth century, are given for comparison with those of the year 1912.

FISCAL YEAR ENDING JUNE 30

COUNTRIES	Imports 1895	Exports 1895	Imports 1905	Exports 1905	Imports 1912	Exports 1912
United Kingdom	$159,100,000	$387,100,000	$175,811,000	$523,396,000	$272,940,000	$564,372,000
Germany	81,000,000	92,000,000	118,268,000	194,220,000	171,380,000	306,959,000
France	61,600,000	45,100,000	89,830,000	76,337,000	124,548,000	135,388,000
Total Europe	383,700,000	627,900,000	540,773,000	1,020,972,000	819,585,000	1,341,732,000
North America	133,900,000	108,600,000	227,229,000	260,570,000	334,072,000	516,837,000
South America	112,200,000	33,500,000	150,795,000	56,894,000	215,089,000	132,310,000
Asia	79,000,000	17,300,000	161,982,000	128,504,000	225,468,000	117,461,000
Oceania	17,400,000	13,100,000	25,388,000	33,079,000	36,464,000	71,936,000
Africa	5,700,000	6,400,000	11,343,000	18,540,000	22,585,000	24,043,000
Total grand divisions	$731,900,000	$806,800,000	$1,117,513,000	$1,481,745,000	$1,653,264,000	$2,204,332,000

The following expresses the same matter in percentages of the total imports and exports:

COUNTRIES	1895		1905		1912	
	Imports	Exports	Imports	Exports	Imports	Exports
Europe	52.41	77.76	48.39	67.23	49.57	60.87
North America	18.29	13.45	20.33	17.16	20.20	23.45
South America	15.32	4.15	13.49	3.75	13.01	6.00
Asia	10.61	2.15	14.50	8.46	13.64	5.33
Oceania	2.39	1.62	2.27	2.18	2.21	3.26
Africa	.78	.79	1.02	1.22	1.37	1.09

It will be observed that while relatively the share of Europe in the import trade of the United States remains fairly constant, the share of Europe in the export trade shows a steady decline. This decline is indicative of the gradual change in character of American exports from raw materials to manufactures.

The character of imports into the United States in general is shown in the following table:

IMPORTS INTO UNITED STATES, CLASSIFIED BY CHARACTER

	FOODSTUFFS IN CRUDE CONDITION		FOODSTUFFS WHOLLY OR PARTLY MANUFACTURED		CRUDE MATERIALS FOR USE IN MANUFACTURING		MANUFACTURES FOR USE IN FURTHER MANUFACTURING		MANUFACTURES READY FOR CONSUMPTION		MISCELLANEOUS	
	Value	Per cent of total	Value	Per cent of total	Value	Per cent of total	Value	Per cent of total	Value	Per cent of total	Value	Per cent of total
1850	$18,011,000	10.38	$21,465,000	12.37	$11,711,000	6.75	$26,163,000	15.08	$95,312,000	54.93	$845,000	.49
1860	35,743,000	10.11	53,771,000	15.26	37,073,000	10.48	23,613,000	6.67	199,878,000	56.52	3,536,000	1.00
1870	53,981,000	12.38	96,253,000	22.08	53,118,000	12.18	54,545,000	12.51	173,034,000	39.69	5,024,000	1.16
1880	100,297,000	15.01	118,125,000	17.69	131,861,000	19.74	110,779,000	16.59	196,587,000	29.43	10,303,000	1.54
1890	128,480,000	16.28	133,332,000	16.89	170,637,000	21.62	116,924,000	14.81	230,685,000	29.23	9,251,000	1.17
1900	97,916,000	11.52	133,027,000	15.65	276,241,000	32.50	134,221,000	15.79	203,126,000	23.90	5,407,000	.64
1910	144,776,000	9.30	181,566,000	11.66	566,270,000	36.37	285,138,000	18.31	367,723,000	23.62	11,471,000	.74
1912	230,358,000	13.93	196,100,000	11.86	555,986,000	33.63	293,739,000	17.77	360,018,000	21.78	17,061,000	1.03

The most important articles imported were coffee ($117,826,000), sugar ($115,515,000), India rubber and gutta-percha ($102,941,000). The most striking facts brought out by the table are

the increase in importation of crude materials for use in manufacture (from 6.75 per cent of the total in 1850 to 33.63 per cent in 1912) and the decline in the relative importance of manufactures ready for consumption (from 54.93 per cent in 1850 to 21.78 per cent in 1912).

The evidence offered by the statistics of imports as to the change in character of American economic life is corroborated by the statistics of exports. Manufactures ready for consumption increased from 12.72 per cent of the total in 1850 to 30.98 per cent in 1912. As indicative of the same tendency, we may note the increase in exportation of partly manufactured goods from 4.49 per cent of the total in 1850 to 16.04 per cent in 1912. Other points of interest brought out by the table are the rise of exports of crude foodstuffs from 1850 to 1880 and their subsequent steady decline. This is indicative of the history of American wheat culture. The steadiness of the relative position of crude materials among exports is largely due to the dependence of European countries upon American cotton, of which the exports in 1912 amounted to $565,849,000.

EXPORTS FROM THE UNITED STATES, CLASSIFIED BY CHARACTER

Bibliography. *Commerce and Navigation of the United States,* issued annually by the Bureau of Statistics, Department of Commerce; the monthly *Summary of Commerce and Finance,* which contains important monographs on special topics; *Consular Reports,* issued daily and monthly, and *Commercial Relations,* published annually, by the Bureau of Foreign Commerce, State Department, give information regarding trade conditions abroad, gathered by the consuls of the United States. The preliminary section of *Commercial Relations* is a review of the world's commerce and is also published separately. Similar official publications are issued by other governments. The consular reports of Great Britain, France, the German Empire, Austria, Italy, and Belgium are to be especially noted, as well as the annual *Statistical Abstract of Foreign Countries* issued by the British Board of Trade.

Among historical and descriptive works, the following will be found useful: Cunningham, *The Growth of English Industry and Commerce* (Cambridge, 1890); Gibbins, *History of Commerce in Europe* (London, 1891); Levi, *History of British Commerce, 1763–1878* (ib., 1880); Day, *A History of Commerce* (New York, 1907); Greenwood, compiler, *Classified Guide to Technical and Commercial Books* (ib., 1905). Among works on commercial geography are Chisholm, *Handbook of Commercial Geography* (London, 1890), and Bartholomew's *Atlas of the World's Commerce* (London, 1906). See BALANCE OF TRADE; EXCHANGE; FOREIGN MONEY; LABOR AND COMMERCE, DEPARTMENT OF.

COMMERCE. A city in Hunt Co., Tex., 90 miles northeast of Dallas, on the St. Louis, Southwestern, and the Texas Midland railroads (Map: Texas, E 3). It is the seat of East Texas Normal College. Commerce carries on a trade in cotton, grain, and cattle, and there are planing, flour, and cottonseed-oil mills, railway repair shops, machine shops, bottling works, and lumber yards. The city contains a public park and owns its water works. Pop., 1900, 1800; 1910, 2818.

COMMERCE COURT. A court created by Act of Congress in 1909 to have jurisdiction in all cases for the enforcement of orders of the Interstate Commerce Commission, other than for the payment of money. The court consisted of a presiding judge and four associate judges, having the rank and tenure of judges of the circuit court. It was believed by the framers of the act that the establishment of such a court would expedite the disposal of cases in its jurisdiction and relieve the circuit courts of a work for which they are not well adapted. Shortly after the organization of the Commerce Court friction arose between it and the Interstate Commerce Commission, the court claiming power to review the findings of the commission as to questions of fact as well as to determine questions of law. By decision of the Supreme Court in 1912 the powers of the Commerce Court were limited to questions of law. The court early acquired a reputation for undue friendliness to the carriers and a reactionary attitude towards the commission. Its position was further compromised by the scandals arising out of the conduct of one of its members, R. W. Archbald (q.v.), and his impeachment in 1912. A bill to abolish the Commerce Court was passed by both houses in 1912, but was vetoed by President Taft. Shortly after the inauguration of President Wilson the court was abolished.

COMMERCIAL COURT. A court constituted of judges of the King's Bench Division, in England, for the trial of commercial causes, i.e., of causes arising out of the ordinary transactions of merchants and traders, such as those relating to the construction of mercantile docu-

ments, the export or import of merchandise, affreightment, insurance, banking, mercantile agency, and mercantile usages. It was not established by an act of Parliament, but was devised by the King's Bench Division for the convenience of suitors and the more expeditious determination of mercantile disputes. While this court has no power to dispense with the ordinary rules of evidence, or to depart from the administration of the law in the ordinary way, it is able, with the assistance of parties and counsel, to dispose of commercial disputes with much more expedition than is possible under the ordinary judicial procedure. Commercial cases are tried by this court upon the evidence prescribed by the orders made in chambers, without difficulty or delay, and with a great diminution of the cost incidental to actions in which the ordinary modes of litigation are followed. This court is a reminder of the Court Piepoudreux, in which the primitive law merchant (q.v.) of England was administered —the court which Lord Coke declares was "incident to every fair and market, because that for contracts, and injuries done concerning the fair or market, there shall be as speedy justice done for the advancement of trade and traffic as the dust can fall from the feet." The connection of this court with merchants of the staple is disclosed by 27 Edw. III, c. 2, which declared that it was designed to give courage to merchant strangers to come with their wares into the realm, and that it should dispense justice according to the law of the staple, or the law merchant, and not according to the common law. Courts for the rapid settlement of trade disputes, called Pypowder courts, were provided for in New York in 1692 (vol. i, Col. Laws, ed. 1894) but these were later merged in the ordinary courts of justice. See COURT. Consult the article, "Merchants of the Staple," in *London Quarterly Review*, vol. xvii, p. 56 (London, 1901).

COMMERCIAL CRISES. See CRISIS, ECONOMIC.

COMMERCIAL EDUCATION. See EDUCATION, COMMERCIAL.

COMMERCIAL GEOGRAPHY. See GEOGRAPHY, ECONOMIC.

COMMERCIAL LAW. A popular term of varying and rather indefinite signification. It includes ordinarily the legal rules which relate most directly to everyday mercantile transactions, and which are based upon, or have been modified by, the usages of trade. These rules are presented in connection with the different topics of commercial law, under such titles as BAILMENT; INSURANCE; NEGOTIABLE PAPER; PARTNERSHIP; SALE; ETC. See also LAW MERCHANT; MERCANTILE LAW.

COMMERCIAL PAPER. See BILL OF EXCHANGE; NEGOTIABLE PAPER.

COMMERCIAL REGISTERS. See MERCANTILE AGENCY.

COMMERCIAL TEMPERANCE LEAGUE. See LEND-A-HAND CLUBS.

COMMERCIAL TRAVELER. A representative of a wholesale or jobbing house, sent throughout the country for the purpose of selling goods to smaller houses in the same line of trade. The commercial traveler is the legitimate successor of the old peddler, though his operations are on a larger scale, and his manner of doing business quite different. In former days, in addition to the peddler, who carried his stock of wares with him, producers frequently came into contact with the purchasers through the great fairs which were held throughout the year in the different commercial centres, and which were a means of drawing sellers and buyers together from great regions of country. The commercial traveler sells by the aid of samples, price lists, and the like, and carries with him no goods for sale. The system of employing commercial travelers is a natural outgrowth of the localization of interests in particular places and of the extension of the markets for particular commodities. It is estimated by the commercial travelers themselves that their class numbered in the United States in 1890 some 300,000 persons. It is claimed by them that since that time their number has decreased, largely through the concentration of capital and the concentration of the management of business in the hands of the so-called trusts. It is claimed by the managers of trusts that one of the chief advantages of their organization has been the saving in the cost of distribution, notably in that of selling goods. It is represented that the various factories and enterprises each employ commercial travelers, whose main duty is not to induce the would-be purchaser to buy, but to persuade him to buy a particular make of goods. As the competition between the different sellers of the same goods ceases by the combination of interests, it is obvious that, instead of sending several salesmen into a district, one can transact all the business it offers. The commercial travelers in the United States are organized in various associations for the purpose of promoting their interests as a class. Of these, perhaps the most important is the Commercial Travelers' Protective League. Consult: Allen, *Ambassadors of Commerce* (London, 1885); testimony of P. F. Dowe before the United States Industrial Commission, in vol. iv of the commission's *Report* (Washington, 1900); also Jenks, *The Trust Problem* (New York, 1900); "Commercial Travelers in Foreign Countries," in *United States Special Consular Reports*, vol. xxviii (Washington, 1904).

COMMERCIAL TREATIES. Treaties between states regulating the commercial rights of the nationals of each in the territories of the other. Such treaties determine reciprocally the rights of the citizens of the one country to resort to the other, to acquire property, to buy and sell. They establish the conditions under which debts due a foreign trader may be collected through the courts, insure him against onerous taxation, etc. Such treaties may assure the citizen of a treaty state the same privileges as those enjoyed by any other treaty state (most-favored-nation clause), or they may admit of discriminations. They may give the citizen of the treaty state privileges in trade identical with those of nationals. This policy is common, but by no means universal.

Treaties of commerce existed in antiquity before the extension of the Roman Empire to practical control of the known world. After the breakdown of the Empire the rights of foreign traders were determined chiefly by custom. In many cases arrangements between the guilds of cities in different regions assumed the form of commercial treaties. Relations between citizens and foreign traders were subject to more or less systematic regulation by the various princes. In the twelfth century, with

the revival of trade and navigation in the Mediterranean, commercial treaties between states became common. A century later a system of commercial treaties grew up in northern Europe.

The early commercial treaties were subject to great variation in content. Each of the several states competing for a particularly lucrative trade would seek to secure more favorable treaties than the other states enjoyed. Apparently before the end of the fifteenth century the principle of equalizing the position of citizens of rival nations had been established in the commercial relations between the Italian cities and the Turks. By the middle of the seventeenth century the principle had become familiar in western Europe also. Since the beginning of the eighteenth century practically every treaty of commerce has contained a clause assuring reciprocally most-favored-nation treatment.

Until modern times no attempt was made to regulate duties through treaties of commerce. The earliest treaty involving the reduction or limitation of duties was the Methuen Treaty between England and Portugal (1703). By this treaty the prohibition upon the importation of English woolens into Portugal was withdrawn, and Portuguese wines were admitted to the English markets upon payment of a duty one-third less than those imposed on French wines. The principle of reciprocal concessions in duties played an important part in the Treaty of 1786 between France and England, and a still more important part in the Treaty of 1860 between France and England. See RECIPROCITY.

Upon the revocation of a treaty of commerce involving reciprocal concessions in duties, the rates imposed upon importations from non-treaty nations become automatically effective. Theoretically the revocation of the treaty destroys also the rights of domicile, the rights of purchasing and selling, the right of employing the courts for the collection of debts, etc., enjoyed under the treaty by the citizen of one state in the territory of the other. In practice, the most essential provisions of an abrogated treaty are usually continued under an executive agreement until a new treaty can be negotiated. See TREATY; RECIPROCITY, and references under the latter.

COMMERCY, kô'mâr'sē'. The capital of an arrondissement in the Department of Meuse, France, on the Meuse, 183 miles east of Paris by rail (Map: France, N., L 4). It is a garrison town and has an interesting seventeenth-century castle, with literary associations of Cardinal de Retz, which also for a time was the residence of Stanislas, King of Poland and Duke of Lorraine. Here, too, Voltaire composed his *Semiramis*. A statue of Don Calmet, the historian, who was born near Commercy, stands in the town. Coal mining constitutes the chief industry; other trade is in hardware, forgings, steel plates, embroidery, and wines. Pop., 1901, 7726; 1911, 8876.

COMMERS, kô-mērs' (Ger. *Kommers*, drinking bout, from Lat. *commercium*, trade, from *com*, *together* + *merx*, merchandise). A social gathering of German students on festival occasions, such as the beginning and ending of the semiannual term (*semester*), the anniversary of the foundation of the university, etc. The main features of such meetings consist in speeches and songs, the famous collection of German student songs, *Gaudeamus igitur*, being used. Several senior students are elected as officials (*Chargierte*) and have entire charge of the affair. Certain rules of etiquette in drinking must be strictly adhered to. Beer is the sole beverage used, and generally a great quantity of it is consumed. After each speech the presiding senior calls for a salamander (*ad exercitium salamandris, bibite, tergite*). All arise and, after having emptied their glasses, pound three times vigorously with them on the tables. If a club member dies, a salamander (*Trauersalamander*) is executed in his memory at the next club commers, when all empty glasses are dashed to pieces. Each students' club arranges a large commers on the anniversary of its foundation. A great many former members visit their alma mater on this occasion, and he is especially honored who can count the most semesters since his matriculation as a student.

COM'MINA'TION (Lat. *comminatio*, threat, from *comminari*, to threaten, from *com*, together + *minari*, to threaten). The name given to a penitential service used in the primitive Church. In the early Church those who were guilty of grievous and notorious sins were put out of the Church, until, on their repentance and after long trial, they were restored to full communion. It seems that, at least from the beginning of the eighth century, there was an office of this kind for public penitents on the first day of Lent; but from various causes the penitential discipline became extinct, both in the Eastern and Western churches, and the office for Ash Wednesday (so called from the penitents formerly coming clad in sackcloth and ashes) is the only memorial of it left. The office, as used in the Church of England, is nearly the same as the older ones found in the pre-Reformation service books of Salisbury and York. The curses contained in Deut. xxvii. against impenitent sinners are read, and the congregation answers "Amen" to every sentence, as acknowledging the justice of the sentences. The penitential office of the American Book of Common Prayer retains only the concluding prayers. Consult Bingham, *Origines Ecclesiasticæ; or, the Antiquities of the Christian Church* (10 vols., London, 1708–22; later ed., 1838–40).

COMMINES. See COMINES.

COMMINES, kô'mēn', PHILIPPE DE (c.1445–?1511). A French statesman and historian. He was born at the castle of Renescure, not far from Hasebrouck, received a careful education, and in 1464 attached himself to Charles the Bold of Burgundy (then Count of Charolais). In 1472 Commines entered the service of Louis XI, the rival and enemy of Charles, who made him one of his confidential advisers. He proved himself a very suitable agent for carrying out the designs of the crafty monarch; but after the death of Louis he incurred the displeasure of the regent, Anne de Beaujeu, by his adherence to the party of the Duke of Orléans (afterward Louis XII), and, after being imprisoned at Loches in an iron cage, was sentenced to the forfeiture of a part of his estates and to 10 years' banishment. This punishment, however, does not seem to have been carried out, for after a few years we find Commines again employed in important affairs of diplomacy; but though he was engaged in the service of Charles VIII and the Duke of Orléans, he failed

to win the confidence of these masters. He died at his castle of Argenton, October 18, probably in 1511. Commines's *Mémoires*, which are a complete survey of the political history of his time and depict vividly the character of Louis XI, are admirably written and afford abundant proof of an acute and vigorous mind. He seems to have looked keenly into the heart of every man who crossed him in life and with cool and severe precision to have dissected him for the benefit of posterity. Among the many editions of his *Mémoires*, the best are those by Lenglet-Dufresnoy (4 vols., London, 1747); by Mademoiselle Dupont (3 vols.), in the *Collection de la société de l'histoire de France* (Paris, 1840–47); by Chantelauze (Paris, 1881); but the best of all is the latest edition by Mandrot (2 vols., Paris, 1901–03). An English translation can be found in the Bohn Library.

COM'MISSA'RIAT (Fr., from ML. *commissarius*, one intrusted with a commission, from Lat. *commissus*, p.p. of *committere*, to commit, from *com*, together + *mittere*, to send). A department of army supply. Until 1912 the department of the United States army providing rations was known as the Commissary or Subsistence Department and supplied food only. It was administered by its chief, the commissary general. On Nov. 1, 1912, the pay, subsistence, and quartermaster's departments were consolidated, by law, under the title *The Quartermaster Corps*, its chief having the title of *Chief of the Quartermaster Corps* with the rank of major general. This consolidated corps now provides subsistence, pay, transportation, clothing, and quarters. Arms, ammunition, and other ordnance supplies are furnished by the *Ordnance Department*. Fortifications are constructed and repaired by the *Engineer Corps*.

In Great Britain the commissariat and army-service corps are responsible for both supply and transport of food. Owing to the constant demands made upon it, and its peculiar importance under the present army system, this branch of the British army is probably unrivaled by that of any other country. A similar system of commissariat to that of the United States obtains throughout Europe generally. See ARMY ORGANIZATION; FIELD COOKING; RATIONS.

COM'MISSARY (Fr. *commissaire*, ML. *commissarius*, commissary, one intrusted with a commission). Formerly an officer of the Subsistence Department of the United States army. This department was abolished by absorption into the Quartermaster Corps Nov. 1, 1912. The duties formerly performed by commissaries are now in charge of quartermasters. (See QUARTERMASTER CORPS.) Regimental commissaries and regimental commissary sergeants were retained when the consolidation was made. At military posts and stations and in the field, the *regimental commissaries*, who are officers of the rank of captain and are appointed to the regimental staff for a term of four years by the commanding officer, assisted by regimental commissary sergeants, perform their duties in the quartermaster's department at the headquarters of their regiment. *Regimental commissary sergeants* belong to the noncommissioned staff. There is one to each regiment. The duties of the commissary, in the English army, are performed by the Army Service Corps; and regimentally, by the regimental quartermaster, assisted by his quartermaster sergeant.

COMMISSION (Lat. *commissio*, commission, from *committere*, to commit, from *com*, together + *mittere*, to send). Boards created for governmental purposes, generally of a temporary nature. They have proved effective agencies for dealing with certain phases of international relations and controversies, and for this purpose are of two classes: (1) commissions of a domestic character, created under statute for carrying out provisions of treaties and conventions; (2) commissions performing international functions, in the nature of conference or arbitration boards.

Examples of the first class in the United States are the commissions created (*a*) under the Treaty of 1819 with Spain, ceding Florida, by which the government sought to adjust citizens' claims growing out of the preceding unfriendly relations; (*b*) under the Treaty of 1826 with Great Britain, to distribute the indemnity for slaves deported in derogation of Art. I of the Treaty of Ghent; (*c*) under the Treaty of 1831 with France, to distribute the indemnity paid for the Spoliation Claims; (*d*) under the Treaty of 1871 with Great Britain, to distribute the Alabama Claims award.

Commissions of the second class have been the usual agencies for effecting arbitrations and, according to their purpose and the authority of their members, may be either merely for conference or for the determination of methods of reaching settlement of disputed questions, or may themselves have the power to adjudicate the issues in controversy. In the latter case they may be composed solely of representatives of the States concerned, or they may include neutral parties selected by these States to act as umpires. During the nineteenth century arbitration as a method of settling international differences steadily increased. The United States has been a party to no less than 57 adjustments of this character, and, except for the train of circumstances resulting in the War of 1812, all differences between this country and Great Britain have been so adjusted. (See ALABAMA CLAIMS; ARBITRATION, INTERNATIONAL; BERING SEA CONTROVERSY; and consult the authorities there cited.) In England and the United States commissions are often instituted, either by legislative authority or by the executive, to assist the government by investigation or advice in matters of internal policy or as permanent organs of administration. Thus New York has instituted a Commission of Appeals with judicial functions to relieve the overcrowded calendar of the Court of Appeals; the United States government has by act of Congress created an Interstate Commerce Commission (q.v.), an Industrial Relations Commission (q.v.) etc. Many of the States have instituted Public Service Commissions (q.v.), Commissions on Prison Reform, etc.

COMMISSION, MILITARY. A certificate of authority or rank, or both. Military rank is defined in the United States Army Regulations as "that character or quality bestowed on military persons which marks their station and confers eligibility to exercise command or authority in the military service within the limits prescribed by law." To such military persons commissions are granted only by the President of the United States, confirmed by the Senate, and published through the Adjutant General's Department. Commissions in European armies are usually distributed among the graduates of the national military preparatory or training

colleges, according to the results of competitive examinations. They are usually restricted, however, even in republican France, to men of good birth or wealthy heritage. In the British army, formerly, commissions, except in the artillery and engineers, were obtainable by purchase—a condition of things which became more and more undesirable as the science of war advanced and thorough preparatory education and training became necessary. It was not until 1871 that the system was abolished by the Gladstone government in the face of great opposition, and the present condition of things inaugurated. The prices of commissions rose gradually from the time of Charles II until the Crimean War of 1854, at which period they ranged in value from £450 for a commission as ensign of infantry of the line to £7250 for that of lieutenant colonel of Foot Guards. At the present time, in the English army, first commissions are granted to successful candidates in open competitive examinations; to highly and specially recommended noncommissioned officers; to certain qualified university graduates; to graduate cadets from government military schools; to a limited number of junior militia officers. See ARMY ORGANIZATION; RANK AND COMMAND.

COMMISSIONAIRE, kŏm-mĭsh'ŭn-âr', *Fr. pron.* kô'mê'syô'nâr' (Fr., commissioner). An attendant at Continental hotels, employed to perform certain miscellaneous services, such as attendance at railroad and steamboat stations to secure guests, taking charge of luggage, seeing it through the customhouse, and sending it on to the hotel, etc., for all which a fee is charged. In Paris such attendants are generally respectable and intelligent and speak English with tolerable fluency. In other parts of the Continent—such as Germany and Austria—there is also a class called commissionaires, who are analogous to the American messenger boys. There, too, they are employed by companies and are uniformed, but one may not call them up by telephone or signal as here, it being their custom to solicit services upon the street. A corps of commissionaires, an association of disabled soldiers of good repute who had retired with a pension, was founded in Great Britain by Sir Edward Walter in 1859, the service of which now extends throughout the large cities. These men are employed in the most varied capacities where high qualifications are required, and may be engaged for permanent or temporary service. So great is the demand for this kind of service that several thousand men are now engaged in it, with stations in many towns of Great Britain and its colonies.

COMMIS'SIONER (from ML. *commissarius*, one intrusted with a commission). Most commonly a person appointed for public service by a commission or mandate of a political authority, but also, sometimes, any one of certain officers elected by popular vote. The term is generally employed to describe an appointive officer who has charge of some branch of a department of government and who is subject to the supervision of a higher official or public board, as a commissioner of water supply of a municipality, who is usually under the control of the mayor or common council. It is the almost invariable title of persons appointed by the government to carry on or supervise some special public work of a transitory nature, as to investigate the conditions and resources of a colony. See COMMISSION.

Commissioner of Assize, in English law, is one to whom a commission is issued by the crown, directing him to "take the assizes," i.e., to act as a justice in hearing certain actions in specified judicial circuits. It may issue to a barrister or sergeant at law as well as to a regularly appointed judge. The practice of appointing these commissioners arose during the reign of Edward I because of the lack of regular courts in the various parts of the country. By the Supreme Court of Judicature Act of 1873, one exercising jurisdiction under a commission of assize is deemed to constitute a court of the High Court of Justice, having all the powers of that court. See ASSIZE; HIGH COURT OF JUSTICE.

Commissioner of Deeds is a person authorized by the state to take acknowledgments of the execution of legal instruments and administer certain oaths voluntarily taken out of court. His powers vary in each jurisdiction and are somewhat similar to, but usually more limited than, those of a notary public. See NOTARY PUBLIC.

COMMISSIONERS OF THE NAVY. See ADMIRAL; also ADMIRALTY.

COMMISSION FORM OF GOVERNMENT. See MUNICIPAL GOVERNMENT.

COMMISSION MERCHANT. A person, called also a *factor*, employed to sell goods consigned or delivered to him by another who is called his principal, for a certain percentage, commonly called his commission or factorage. As the goods thus received are said to be consigned, the commission merchant or agent is often called a consignee. See FACTOR.

COMMIT'MENT (from *commit*, Lat. *committere*, to commit). A warrant of a justice, magistrate, or other official having police jurisdiction, ordering that a person accused of a crime be held for trial, and either directing that he be sent to prison immediately, or admitting him to bail to secure his attendance at that time. The term "commitment" is also sometimes used of the sending a person to jail to enforce obedience of an order or decree of a court; but the term is most frequently used where the person is to be detained for some temporary purpose, as above indicated. It is seldom employed where the prisoner is finally sentenced to a term in prison as a punishment, after having been found guilty of a crime, in which case the judgment of the court is usually considered a sufficient warrant for the sheriff or proper authorities to carry out the sentence. See JUDGMENT; SENTENCE; SHERIFF; WARRANT.

COMMIT'TEE (Lat. *committere*, to intrust). A group of persons, rarely less than three, to whom an organized body, legislative or otherwise, intrusts or *commits* certain matters for investigation, consideration, and decision as to their meriting the attention of the whole body. A *standing committee* is one which exercises its functions permanently and considers all matters coming within a certain allotted sphere of action. In modern parliamentary practice immense importance attaches to the work of standing committees; and so true is this that modern legislation has been by some termed "government by committee." Almost every matter brought before such bodies as the United States Congress and the legislatures of the several States is at once referred to a standing committee, which holds meetings by itself, examines the subject closely, summons witnesses, if neces-

sary, and at length reports back to the main body its findings and conclusions, with recommendation to act favorably or adversely. The committee usually formulates its conclusions in a bill recommended to be passed if action is thought desirable. The same procedure is followed in the British Parliament. The United States House of Representatives has at least 60 committees; the Senate about 50; these consist of not less than three, and, except in one or two cases, not more than 15 members. The most important committees of the House are that of Ways and Means, which considers all matters relating to the tariff, internal taxation, and, generally, the revenues of the government, and that of Appropriations, which deals with all estimates of appropriations to be made by Congress and the framing of bills for that purpose. Other important standing committees are those of Banking and Currency, Foreign Affairs, Patents, Pensions, Judiciary, and Railways and Canals. Similar committees exist in the British Parliament. The argument in favor of the system of committees is the impossibility of a large deliberative body's examining every matter within the scope of its action in detail; the objection to it is the possibility of more easily corrupting or deceiving a small body than a large one; but whatever be the argument against it as a matter of theory, the committee system is fully recognized as a necessity and is too firmly intrenched in parliamentary practice to be successfully argued against. A *select committee* is one appointed at a special time to consider and report on a given topic; when this has been done, its powers and existence cease. The *committee of the whole* is the entire body sitting in a deliberative rather than a legislative character—for the purpose, that is, of debating and consulting upon the details of a question rather than of taking legislative action upon it. In the British House of Commons there is a regularly chosen chairman, other than the Speaker of the House, who presides over all committees of the whole; in the United States Congress any member may be chosen to preside in a committee of the whole. A *joint committee* is one made up of separate committees appointed by two bodies; in the United States, owing to the dual constitution of the legislatures, it is often necessary to appoint such joint committees to bring the two bodies to a mutual understanding and make harmonious action possible. In the national Congress such committees, known as *conference committees*, are almost always necessary to eliminate the discrepancies that arise in any important project of legislation in its passage through the two houses. Such committees are by tradition restricted to reporting for final passage only such parts of the project as appear in the measure as passed in either house.

In law, a committee is a person or persons appointed by a court having equity or probate jurisdiction to take charge of the person and manage the property and business affairs of an individual who is legally incompetent by reason of lunacy, idiocy, or habitual drunkenness. The duties are much similar to those of a guardian of an infant, and the committee is under the supervision and control of the court appointing him. He must file inventories and accounts, maintain all necessary actions in behalf of his charge, and apply the income, and the proceeds of the property itself if necessary, to the support of the incompetent and his family. If the incompetent recovers, he may apply to the court to have the committee discharged and resume his personal freedom and the control of his property. The power of the committee ceases at the death of the incompetent, and his estate is administered in the usual manner. See GUARDIAN; LUNATIC; HABITUAL DRUNKARD; IDIOCY.

The term is also employed to designate a person or persons appointed to take charge of specified matters by any body organized for governmental business or social purposes, and to make a report of the result of their efforts to the appointing power. See LEGISLATURE; PARLIAMENTARY LAW.

COMMITTEE, THE. A comedy, by Sir Robert Howard, published in 1665, but played for several years previously. In 1797 Knight brought out an adaptation of it under the title of *The Honest Thieves*.

COM'MODA'TUM. In the Roman law, an informal agreement for the return to the owner of a chattel gratuitously loaned to another. The return of the thing (*res*) loaned, or of its equivalent in quantity and quality, was enforced by a real action. In our law the commodatum has taken its place as a form of bailment (q.v.).

COMMODE, kô'môd' (Fr., Commodus). A play by Thomas Corneille, played at the Louvre for Louis XIV in 1659.

COMMO'DIA'NUS. A Christian Latin poet, of the third century, supposed to have been of African extraction. His extant poems, *Instructiones per Litteras Versuum Primas* (80 pieces, in acrostic and telestic verse), and the *Carmen Apologeticum*, both of which are aimed against the heathen and the Jews, lack poetic fire and present few attractions as literary productions. Although some attempt is made to imitate the general rhythm of the hexameter, the author in reality employs a peculiar prosody, based partly on accent and partly on syllabic quantity. There is an edition by Dombart (Vienna, 1888), and an English prose translation of the *Instructiones*, in *Ante-Nicene Fathers* (Buffalo, 1886–96). See Teuffel, *History of Latin Literature* (Eng. trans., London, 1892).

COM'MODORE (probably from Sp. *comendador*, It. *comandatore*, OF. *commandeor*, Fr. *commandeur*, commander). Previous to 1862 the courtesy title "commodore" was given to all captains in the United States navy who had commanded a squadron, but no actual rank higher than that of captain existed. In July, 1862, the first captains to hold a higher office were commissioned as commodores. In 1882 the number of commodores on the active list was reduced from 25 to 10, and in 1899 the grade was abolished and the 10 commodores on the list promoted to the rank of rear admiral, the numbers in that grade being increased from 6 to 18. The title is now borne only by certain officers on the retired list and upon their death will become extinct. In the British navy captains having certain important commands are officially styled commodores (as the officer in command of the submarine flotilla), and have an increase of pay while on this duty, but there is no grade of commodore on the British Navy List. See ADMIRAL.

COM'MODUS, LUCIUS ÆLIUS AURELIUS. A Roman Emperor (180–192 A.D.). He was born in 161 A.D. and was the son of Marcus Aurelius Antoninus. Great pains were taken with his education, but to no purpose. When he was

summoned to the throne on his father's death (March 17, 180), he was successfully fighting the Marcomanni and other tribes on the upper Danube, but he hastily concluded a treaty with the barbarians and reached the capital in the autumn. The cruelty to which he was always prone was especially exhibited after a conspiracy by his sister Lucilla against his life had been discovered in 183. Nearly all who had risen to honor during his father's lifetime were sacrificed to appease his jealousy of the good and the great. Gross prodigality also marked his reign. He was proud of his physical strength and exhibited it in gladiatorial combats. For each of these exhibitions he charged the state an enormous sum. He used also to sing, dance, play, act the buffoon, the peddler, or the horse dealer. He demanded to be worshiped as a god and assumed the title of Hercules Romanus. Many unsuccessful plots were devised against his life. Finally, his mistress, Marcia, in concert with the prefect Lætus and the Imperial chamberlain, Eclectus, after they had failed in an attempt to poison him, caused him to be strangled by Narcissus, a famous athlete. The life of Commodus, written by Lampridius, is to be found in the so-called *Augusta Historia*. See AUGUSTAN HISTORY.

COM'MON (OF. *comun*, Fr. *commun*, from Lat. *communis*, OLat. *comoinis*, common). In the law of real property, the right of one person, in common with others, to take a profit, i.e., a thing of value, as the herbage or other produce or minerals or wild animals, from the land of another. The person over whose land the right is exercised may be a private owner or the state. The term is somewhat loosely employed as the equivalent of *profit à prendre* (q.v.); but such a "profit" may be exclusive or "several," in which case it is not properly characterized as a common. Blackstone, however, seems to use the term in this sense, and he enumerates four species of commons, viz., *common of pasture*, or the right of feeding one's beasts on another's land; *common of piscary*, or a liberty of fishing in another man's water; *common of turbary*, a liberty of digging turf upon another's ground; and *common of estovers*, a liberty of taking necessary wood, for the use of furniture of a house or farm, from off another's estate. These rights, with the various other *profits à prendre*, will be considered under that head. See also HEREDITAMENT; INCORPOREAL.

The term is often used to denote the common use of a piece of uninclosed ground possessed by all the inhabitants of a village or hamlet. The right of common is "disturbed," as the legal phrase is, when one who is not possessed of the right unlawfully infringes it, or when one possessed of the right exceeds his lawful use, or where one wrongfully prevents others possessed of the common right from exercising it, as where he incloses the land. In Great Britain the right of common was formerly possessed from time immemorial in almost every village with regard to certain pieces of land which were not held by any owner in fee, but might be fairly considered to belong to the community as a body. Statutes, both public and private, permitted the inclosing of such common land under various conditions, such as the consent of two-thirds of those exercising the right of common. By this legislation, and by acts of usurpation on the part of individuals, much of the common land has been lost; of late years the further inclosure of common land has been to some extent guarded against. In the United States the most frequent use of the term is as a substantive to denote a piece of ground set apart for public uses, such as open-air meetings, reviews, and for the general pleasure of the people at large. See PROPERTY, and the authorities there referred to.

COMMON, DOL. Subtle's mistress, in Ben Jonson's *Alchemist*.

COMMON, TENANCY IN. The most usual form of common ownership of lands or goods. It may be constituted of two or any greater number of persons, who may have equal or unequal shares, and whose titles and interests are distinct although undivided from those of their colleagues. Accordingly, while the tenant in common cannot claim any specific portion of the property as his own, he may, nevertheless, deal freely with his undivided share, alienating or devising it at his pleasure, or he may, by appropriate legal action, compel the partition of the property; whereupon, if it be divisible in fact, his share will be set off to him, as a separate parcel, in severalty. If it be not physically severable—as a mansion or a horse—the courts will direct its sale and the distribution of the proceeds among the several owners in the proportion of their respective interests. If the estate of a tenant in common be of an inheritable nature—as an estate in fee simple—it will, upon his death, descend, like his other real property, to his heirs. In the event of a conveyance or descent of such an interest the new holder simply takes the place of his grantor or ancestor and becomes a tenant in common with the surviving cotenants of the latter.

In its incidents the tenancy in common is at the present time not distinguishable from the estate which arose at common law by the descent of lands to two or more heirs who were entitled to share the estate. (See COPARCENARY.) Indeed, this is now in the United States the more usual method of creating a tenancy in common. It is, however, to be sharply distinguished from the other forms of common ownership, as joint tenancy, tenancy by entireties, and partnership, the two former of which are attended by the incident of survivorship, and the last of which is affected by the peculiar qualities of the partnership relation. In general, all tenants in common of a chattel or an estate are equally entitled to its possession and use, but the tenant for the time being in possession is protected by law from any forcible interference with his possession by his cotenant. The latter must wait for a "convenient" opportunity to secure the possession to which he is equally entitled.

At common law, upon a conveyance of lands to two or more persons without more being said, they took the property as joint tenants, and not as tenants in common. This presumption has generally been reversed by statute in modern times, and now such a grant will vest the property in the grantees as tenants in common, unless the deed declares that they are to take as joint tenants. See OWNERSHIP; PROPERTY; and the authorities there referred to.

COMMON ASSURANCE. The technical description of the ordinary processes for conveying the title to land. The term "assurance" was also employed, without the qualifying adjective, in such phrases as "a covenant to make further assurance" (meaning a covenant to protect the title conveyed by making or procuring the making of any further instrument which might be

necessary for that purpose), but the instrument or act of conveyance itself was always described as a common assurance. Blackstone defines common assurances as the legal evidences of the translation or transfer of real property, and comprehends under that description the four following modes of alienation: (1) by matter *in pais* or by deed; (2) by matter of record, or an assurance transacted in the King's public courts of record; (3) by special custom obtaining in some particular places and relating only to some particular species of property; (4) by devise.

By *matter in pais* is meant a transaction to be evidenced by witnesses before a jury, and it has reference to the old common-law method of conveyance by feoffment or livery of seisin. The deed referred to is the deed of grant, which has in modern times come to supersede most of the other modes of transfer. Alienation by *matter of record* includes assurance by private acts of Parliament, the King's grants, and the awkward processes by fictitious suit, known as common recovery and fine. Under alienation by *special custom*, Blackstone describes only the peculiar mode of conveyance "by surrender and admittance," whereby copyhold lands were transferred. *Devise* was employed in the same sense as that which it now bears, and included any gift of land, present or future, or of any interest in land, by last will and testament.

It will be noticed that these four modes of conveyance comprehend every form of voluntary alienation of real property, only involuntary alienations, as by forfeiture, escheat, bankruptcy, eminent domain, and the like, and the transmission of lands by descent, being omitted from the category of common assurances. See ALIENATION; CONVEYANCE; TITLE; and the names of the various common assurances referred to above. Consult the *Commentaries* of Blackstone, Stephen, and Kent, and the authorities referred to under CONVEYANCING and TITLE.

COMMON BENCH. The earlier name of the English Court of Common Pleas. See COMMON PLEAS, COURT OF.

COMMON CARRIER. See CARRIER, COMMON.

COMMON COUNCIL. The name usually applied to the local legislature in American cities. Usually a legislative body, so called, consists of only one chamber, but the term may be applied to a bicameral body as well as to one chamber in a bicameral assembly.

COMMON COUNTS. In law, in general, technical forms for stating a cause of action, used particularly in assumpsit (q.v.), in order to take advantage of proof which might vary from the particular facts and circumstances alleged and yet justify a recovery. Common counts were founded on an express or implied promise to pay money. Those in most general use were known as counts for "goods sold and delivered," "work, labor, and services," "money paid," "money had and received," "money lent," "account stated," and "use and occupation." Their names are somewhat descriptive of their purposes; thus, under the count "money had and received" the plaintiff could prove any circumstances under which the defendant received money which in law he ought to pay or return to the plaintiff. The money may have been obtained by fraud, but a fictitious promise to pay could be alleged, the fraud proved, and it was held the law implied a promise to pay on the part of the defendant. The common counts originated in England, but were abolished, together with all ancient forms of action, by the Judicature Acts. In the United States they are still used in some of the States where common-law pleading is retained, but in most States simpler and less technical forms of pleading have been substituted. See COMMON FORMS; PLEADING.

COM'MONER. In England, a term applied to all citizens except the hereditary nobility. John Hampden was called the "great commoner," and the title was also given to the elder Pitt before he was created Earl of Chatham. In Oxford University students of the second class who pay board are called "commoners," ranking between gentlemen commoners and bursars.

COMMON FEELING. See COMMON SENSATION.

COMMON FIELD SYSTEM. See OPEN FIELD SYSTEM.

COMMON FORMS. In law, the forms of personal actions in common-law pleading (each action having a general form of declaration or complaint), the allegations in which were usually fictitious, but which had a recognized meaning and which would be supported by a certain line of proof. Thus, in the action of trover (Fr. *trouver*, to find) it was alleged that the plaintiff lost a chattel and that the defendant found it, and this allegation could not be traversed or denied by the plaintiff, but plaintiff could prove any facts which in law would entitle him to the chattel and disregard the fiction of finding. These forms of pleading originated in the feudal period in England, and they arose out of the practice of granting a writ for trying the justice of some complaint for the redress of which there was no other provision in the law. The following forms of action were in general use: assumpsit, covenant, debt, detinue, replevin, trespass, trespass on the case, and trover (qq.v.). These forms were generally adopted in the United States, but have now in most of the States been superseded by simpler and less technical forms of action, usually through the enactment of codes of civil procedure. They have also been abolished in England by the Judicature Acts. See COMMON COUNTS; PLEADING.

COMMON LAW. The great body of English unwritten law (from which also is, in the main, derived the common law of the English colonies and of the United States), as distinguished from written or statutory law, from the Roman civil law, from international law, and from the systems of law administered by courts of equity and admiralty courts. Blackstone divides the civil law of England into the *lex scripta*, or statute law, and *lex non scripta*, or common law, and defines the latter as consisting of general customs, of particular customs prevailing in certain districts, and of certain laws used in particular courts. Common law is based primarily on customs growing out of the united wisdom and experience of mankind; these customs in time become recognized as reasonable, consistent, and established, are sanctioned by the courts, and are interpreted and made binding by the decisions of the final courts of appeal. While continental countries generally follow the carefully classified and codified system of the Roman civil law, the common law of England was a growth, gradual and in its origin complex—derived from the customs and precedents of Anglo-Saxons, of Normans, of the united England which followed the Norman rule, and including also some prin-

ciples and practices derived through various sources from the Roman law itself. It must be remembered that even at the time of the Norman Conquest England had a definitely established, though, of course, crude, legal system, and on that system much of the common law, though perhaps not the greater part, rests.

From its nature the common law cannot be sought in any one book or digest; its principles are discussed in the treatises of innumerable writers of textbooks and commentaries and in the records of the decisions of the courts. Commentators cannot make law, but they may discuss and record it. The real oracle of the common law is the judge, who considers and weighs precedents, measures them by the standard of reason and public policy, and sets finally the seal of authority upon them by his decision. Great importance, therefore, is attached to precedent in ascertaining the principles of the common law; it was, it is conceded, because too much importance was attached to precedent that, side by side with the system of common law, grew up, to correct and supplement it, a system of equity law. (See EQUITY.) On the other hand, the greatest jurists of the English bench have most widely recognized the fact that precedent must be tempered by reason. Lord Mansfield more than any other one judge, enlarged in this way the interpretation and application of common-law principles, insomuch that he was accused of assuming legislative rather than judicial powers. But there can be no question that his view, carried out with unswerving devotion to natural justice, to the necessities of growing and changing mercantile and legal conditions, and to the true fundamental principle of precedents, did much to make the administration of law in England pliable and efficient. We may illustrate the manner in which common custom became common law by citing the recognition by courts of the already long-established principle of primogeniture; of the similar recognition of the fact that the validity of a deed depends on its being sealed and delivered; of the recognition of the principle that wills should be less strictly construed than deeds; of the sanctioning the already existing mercantile custom that three days of grace should be given in payment of notes and bills. In all these cases the law did not make the custom or principle, but found it ready made to hand, recognized its convenience and usefulness, and sanctioned it by judicial authority.

Though based so firmly on custom and precedents, the common law is not totally inelastic. The continual growth of modern civilization, the progress of invention and manufactures, and the increased complexity of business—all have demanded from the common law recognition and an adaptation of the law to the conditions of the time. The rule generally followed as to precedents is that the courts shall always "abide by former precedents where the same points come again into litigation." But the decision of one of two courts of concurrent jurisdiction does not necessarily bind the other, nor will a new decision by a court of appeal always be supported by that very court in subsequent cases. It follows, therefore, that often precedents almost equal in number and authority may be quoted on both sides of a given question, and in such a case the power and authority of the court appealed to are called upon to decide as is consonant with justice and reason. In the United States, as each State has a final court of appeal, and as theoretically they are of equal authority, such a contradiction of precedents and decisions is frequent.

It is sometimes said that the United States, considered as one body politic, has no common law. It would, perhaps, be more accurate to say that, owing to the restricted character of the jurisdiction of the Federal courts, its common law is more indefinite and less completely developed than is that of the several States. This is largely due to the fact that, by Act of Congress, the Federal courts, when acting as common-law courts, are required generally, though not invariably, to follow the common law as it stands in the particular State where the action arises. As for the States themselves, the common law of England, as it existed at the time of the Revolution, together with such of its statutes as reasonably applied to the colonies, became at that time the common law of the States. In the United States, as in England, of course, the body of the common law has developed with growing industrial conditions, and has, on the other hand, been from time to time restricted by statutes of the States or of the United States. What we have said in regard to the common law of the States has one exception—Louisiana, which, when ceded to this country, retained in the main the system of French civil law already existing. The common law on a given point is always superseded by a statute covering that point. Thus, in the United States the order of authority of law is: the Federal Constitution; treaties with foreign powers; and acts of Congress; the constitution of the State; the statutes of the State; and finally the common law. When a statute is rescinded, the common law on that point again becomes of force, unless there be an older unrescinded statute, in which case that revives. For a sketch of common-law courts, pleading, etc., see COURT; PLEADING; ETC.

Bibliography. Consult: The commentaries of Blackstone, of Kent, of Stephen (13th ed., London, 1899), of Broom (9th ed., London, 1896); Coke, *First Part of the Institutes of the Laws of England; or a Commentary upon Littleton* (any edition); Pollock and Maitland, *History of the Laws of England* (2d ed., Boston, 1899); Stephen, *History of the Criminal Law of England* (London, 1883). For a statement of the elementary principles of the common law, consult Robinson, *Elementary Law* (Boston, 1882), and Minor, *Institutes of Common and Statute Law* (2d ed., Richmond, 1876–79).

COMMONPLACE BOOK. A sort of scrapbook for jotting down memoranda, occasional thoughts, or ideas for subsequent development. Southey, Dickens, and Charles Reade, among others, kept commonplace books, of which they made much use.

COMMON PLEA. A civil action between individuals, as distinguished from criminal proceedings, or other cases to which the government is a party. See CIVIL ACTION; PROSECUTION; COMMON PLEAS, COURT OF.

COMMON PLEAS, COURT OF. One of the great historic tribunals of the common law in England. It was instituted, as a separate jurisdiction, in the reign of Henry III, under the name of the Court of Common Bench, but its real origin lies further back, in the provision of Magna Charta that common pleas (*communia placita*) should no longer follow the

King's Court (*Curia Regis*) in its wanderings over the kingdom, but should be held in a fixed place (Magna Charta, 1217 s. 17). The rapid rise in power and influence of the court held by the King in person, or by his judges who attended him, combined with the necessity of bringing all causes, whether of a public or private nature, to the attention of a constantly moving court, constituted, for private suitors, a grave abuse. This was remedied by definitely establishing at Westminster, under the provision of the charter above referred to, a sufficient number of justices and barons of the King's Court to hear the private causes (common pleas) which could not conveniently follow the royal progresses. From this beginning down to the reform of the English judicature in 1875, the Court of Common Pleas at Westminster, as it was commonly called, shared with the Court of King's Bench the greater part of the common-law jurisdiction of England.

As distinguished from the King's Bench, the Court of Common Pleas was, as its title would seem to suggest, the popular and common court of the kingdom, having exclusive jurisdiction in all real actions, or suits relating to land, and in actions between private persons to try private rights; while the King's Bench was, for a long time at least, limited to pleas of the crown, i.e., public causes, and appeals from county courts and other inferior jurisdictions. This division of business threw upon the Common Bench the great mass of litigation, so that Sir Edward Coke called it "the lock and key of the common law," and Sir Orlando Bridgman described it as "the common shop for justice." The court was composed of a chief justice and as many common (or *puisne*) justices as the business of the court required. The number of these varied at different periods from four to eight. It was abolished by the Judicature Acts, 1873–75, and its functions transferred to the High Court of Judicature. See CURIA REGIS; COURT; EXCHEQUER; KING'S BENCH. The origin and history of the English courts of justice are concisely and accurately described by Inderwick, *The King's Peace: A Historical Sketch of English Law Courts* (London, and New York, 1895).

COMMON PRAYER BOOK. See PRAYER BOOK.

COMMON RECOVERY. At common law, a mode of alienation, or process for conveying land, through the medium of a fictitious suit in the superior courts of law. There is no reason to doubt the tradition, to which Blackstone has given the weight of his authority, that this method of conveyance was "invented by the ecclesiastics to elude the statutes of mortmain." Being incapable of taking land by feoffment or deed, there was nothing to prevent them from bringing a suit for the recovery of the land of a collusive donor, alleging that the title was in them, and if he thereupon made default, the judgment of the court in their favor operated to vest the title conclusively in them. In form it was a judicial determination that they were the owners of the land as against the defendant. In effect it was a device for enabling the defendant to transfer his interest in the land to them. Blackstone says, further, that after the invention of common recoveries they "were encouraged by the finesse of the courts of law in 12 Edw. IV in order to put an end to all fettered inheritances, and bar not only estates tail, but also all remainders and reversions expectant thereon." This refers to the famous struggle between the great landowners, seeking to tie up their estates in their families by entailing them on their issue and making them inalienable, and the lawyers and law courts, who aimed, in the interests of public policy, to defeat the attempt. The statute *De Donis Conditionalibus* (known also as the Statute of Westminster II), enacted by Parliament in 13 Edw. I (1285), provided that lands given to a man and the heirs of his body, known as conditional gifts, should not be alienable so as to defeat the inheritance of the issue therein nor so as to cut off the interests of those to whom the estate was to go upon the failure of such issue.

Several devices were tried to avoid the statute and break entails, but none of them was entirely successful until the year mentioned by Blackstone, 12 Edw. IV (1473), when, in the famous "Taltarum's Case," a common recovery was employed for the purpose. This proved to be entirely successful in barring the claims of the heir upon whom the lands were entailed, and, by a subsequent development of the action, all remainders and reversions dependent upon the fee tail were also cut off.

The process was too difficult and technical to be set forth at length here, but it may be briefly described as a collusive and fictitious suit, instituted by the person to whom the fee was to be conveyed (called the demandant) against the one who desired to bar the entail and convey the land (known as the tenant), by suing out a writ called a *præcipe quod reddat*, in which the demandant alleged that the tenant had no legal title to the land and that he, the demandant, had been turned out of it. The tenant defended the suit, but at a subsequent stage of the proceedings—which were in part conducted in open court—disappeared and had judgment rendered against him by default, and the lands were thus "recovered" by the demandant. This recovery, being a supposed adjudication of the rights of the parties, bound all persons and vested a free and absolute fee simple in the recoverer. The process was known as "suffering a common recovery." A similar but less difficult and somewhat less efficacious proceeding was known as "levying a fine." The fine was by statute, in the reign of Henry VIII, substituted for the more cumbrous and expensive common recovery as a means of barring entails, and both have now been superseded by simpler and more modern conveyances. Recoveries were occasionally employed in the early history of some of the United States, but are now everywhere obsolete, and in some States expressly abolished by statute. See FINE; COMMON ASSURANCE; CONVEYANCE; TITLE. The common recovery is fully described by Blackstone, *Commentaries on the Laws of England*, bk. ii, chap. 21. See also: Pigot, *Treatise of Common Recoveries: Their Nature and Use* (Dublin, 1792); Digby, *An Introduction to the History of the Law of Real Property* (5th ed., Oxford, Eng., 1900); Leake, *Elementary Digest of the Law of Property in Land* (London, 1874).

COMMONS. A name given to meals provided in English colleges and inns of court for their members. It is used occasionally in the United States for the college dining room when that is under college control.

COMMONS, HOUSE OF. See PARLIAMENT.

COMMONS, JOHN ROGERS (1862–). An American economist, born in Hollandsburg, Ohio. He graduated at Oberlin College in 1888 and studied at Johns Hopkins University; taught economics at Wesleyan (1890), and sociology at Oberlin (1892), Indiana University (1893–95), and Syracuse University (1895–99); and in 1904 became professor of political economy in the University of Wisconsin and director of the American Bureau of Industrial Research. In 1911 he was appointed a member of the Wisconsin Industrial Commission; and in 1913 he published a report of the work of the Milwaukee Bureau of Economy and Efficiency. He wrote: *The Distribution of Wealth* (1893); *Proportional Representation* (1896; revised, 1907); *Trade Unionism and Labor Problems* (1905); *Races and Immigrants in America* (1907); *Labor and Administration* (1913). He was one of the editors of *A Documentary History of American Industrial Society* (1910).

COMMON SCHOOLS. Since instruction has, at least in modern times, been provided for the great majority of the people, the term "common schools" implies that the schools are for the masses of the people, or, where class distinctions are drawn, for the common people. The term, as used in the United States, implies, as well, that such schools are supported and controlled by the people and charge no tuition. The latter characteristic is now true for the most part of the common schools of Europe. The details of all such systems of schools are given in the article on NATIONAL EDUCATION, SYSTEMS OF.

Previous to the beginning of modern history no people ever contemplated the education of the masses, though with most ancient peoples, as well as during the greater part of the Middle Ages, there were schools that provided the rudiments of education for a limited class. With the Greeks and Romans this class was not a special educational class, the priesthood, as with most other ancient peoples, but included all those entitled to full citizenship. At Athens the elementary schools were private and taught gymnastics and music, the latter including reading and writing. At Rome the elementary schools were introduced at a much later date than at Athens, were also private, and gave instruction in reading, writing, and calculation. During the Middle Ages such educational efforts as were made were wholly under the auspices of the church. Schools were established and maintained by the church, until the Renaissance of the twelfth century. The mediæval schools were either singing or grammar schools. The former were the elementary schools and were designed primarily for training boys to assist in the church service. A rudimentary knowledge of reading, and often of writing, Latin, as well as instruction in singing, was given. Such schools were very numerous before the Reformation, but how numerous or how extensive is a question which research in educational history has not yet determined. In the large commercial and industrial cities of northern Europe private schools for teaching the three R's and some commercial subjects sprang up in the thirteenth and fourteenth centuries. But it is certain that after the Reformation a new impetus was given, both in Protestant and Catholic countries, to the establishment of common schools—in the one case by church and state, in the other by new teaching orders.

Until the middle of the eighteenth century the common schools still remained almost entirely under ecclesiastical direction. Later they were secularized, and attendance made compulsory. This was first accomplished on a large scale by Prussia in the latter half of the eighteenth century. In France the system of public elementary schools under the control of the state has been developed since 1833. In Scotland common schools have existed very generally since the latter part of the seventeenth century, though it was not until 1872 that these were placed entirely under the control of the state and attendance made compulsory. English common schools on any extensive scale date from the opening of the nineteenth century, and only since 1870 has there been any concerted governmental effort towards building up a common-school system.

In the United States common schools were early established in most of the colonies. Often these were private schools taught by some woman as a means of support. They were consequently called, as in England, dame schools, or sometimes, from the place where held, kitchen schools. The early colonists, however, gave greater attention to the founding of secondary or grammar schools as being of more immediate importance in the education of a ministry, this forming the chief motive to an education with them. In 1642 Massachusetts required that every township containing 50 families should have a school for all the children, the tuition to be paid either by their parents or by general provision. While in New England such common schools became free in the sense of charging no tuition during the latter part of the seventeenth century, in most of the United States the free common school is a development of the second quarter of the nineteenth century. During and since that time the system of free common schools has been systematically extended throughout all the States and Territories, and the course of instruction has been greatly enlarged. As each State has control of its own schools, there is great variety in the details of their management, but the following leading principles are the same in all: (1) a system of graded schools, embracing primary, grammar, and high schools; (2) State superintendents, who determine by examinations the qualifications of the teachers and watch over the efficiency of the instruction given; (3) uniformity of textbooks; (4) public examinations; (5) school libraries and illustrative apparatus, and in many cases textbooks supplied at public expense; (6) improved construction and furnishing of schoolhouses; (7) access to the school for all children of suitable age; (8) normal schools for the training of teachers. Some of the States have funds to aid them in supporting their schools. In the West these funds are generally large, arising from the sale of lands granted by the general government and in some instances also by the State. Such grants by the United States for school purposes amount to 68,000,000 acres, valued at more than $100,000,000. Before the Civil War there was no general and well-ordered system of common schools in the Southern States. But in their new constitutions they have made pro-

vision for them and are now pressing forward the work. In 1867 a National Bureau of Education (see EDUCATION, COMMISSIONER OF) was established by Congress for the purpose of collecting statistics and diffusing information on the whole subject, so as to aid the people of the United States in the adoption and support of the best school systems and to advance in other ways the cause of education throughout the land.

While the Massachusetts school law of 1647 had a compulsory feature, no effective system of compulsory education was ever adopted in the United States before the reform in Massachusetts that resulted from the efforts of Horace Mann (q.v.). At present (1914), 42 States, and the District of Colombia, the exceptions being in the South, have laws making education compulsory, either at a public or an approved private school. In 1910–11 there were 18,035,118 children enrolled in the common schools of the United States, out of a total of 19,636,230 enrolled in all the schools. The enrollment in the common schools is about 73 out of every 100 children of school age. The average length of the period of attendance was 101.8 days out of a total length of 156.8 days for the school term. There were more than 533,500 teachers engaged in the common schools, and the total expense of such schools was $446,726,929. See EDUCATION; NATIONAL EDUCATION, SYSTEMS OF.

COMMON SCOLD. One who, by the practice of habitual scolding, disturbs the peace of the neighborhood. Scolding, in itself, is not obnoxious to the law, and, so long as it is confined to the domestic hearth, it is *damnum absque injuria*, no matter how persistent and violent it may be. It is only when the practice is indulged in public and with such frequency and under such circumstances as to threaten a breach of the peace that it becomes a public nuisance and punishable as such. The common law took cognizance of the offense and resorted to various devices, mostly of an unpleasant nature, for the punishment of those convicted of it. Among these punishments were the stocks (q.v.), the ducking stool (q.v.), and the branks (q.v.), the last named being, during the period of its application, the most efficacious. The practice of punishing common scolds survives, sporadically, in the United States, in some of which it is recognized in the penal statutes, but the punishment has been mitigated to fine and imprisonment. Consult the authorities referred to under the title CRIMINAL LAW.

COMMON SENSATION, or COMMON FEELING. A collective name for the sensations which make up our general sense of bodily health or ill health, well-being or ill-being. It includes, e.g., the diffused sensations of the tactual sense: shuddering, shivering, tingling, tickling, creeping, goose flesh, pricking, pins and needles; sensations which can in many cases be set up as concomitant sensations to squeaking or sawing noises and the like. (See references under ANTIPATHY.) It includes, further, dizziness (see STATIC SENSE); the sensations of muscular exertion and fatigue; and the muscular and organic pains. Indeed, on the theory that pain is aroused by overintensive stimulation of any and every sensory nerve (Wundt, *Phys. Psych.*, 1910), pain would be, literally, a sensation "common" to the whole sensitive organism. Sometimes the two sensations of temperature are called common or general sensations; and the alimentary sensations of hunger, thirst, and nausea, as well as the respiratory sensations of stuffiness, of a "bracing" air, etc., are also covered by the term. It is clear that the phrases "common sensation," "common feeling," "general sense," belong to a psychology that had not yet succeeded in analyzing the more massive complexes of organic sensations and in referring them to specific organs within the body. In the present state of our knowledge there is no reason for their retention. Consult Kuelpe, *Outlines of Psychology* (London, 1909), and Titchener, *Text-Book of Psychology* (New York, 1910). See CUTANEOUS SENSATION; ORGANIC SENSATION.

COMMON SENSE. A pamphlet by Thomas Paine, published in Philadelphia, 1776, advocating the separation of the United States from England. It was thought of sufficient importance at the time to receive public notice from General Washington.

COMMON SENSE, THE PHILOSOPHY OF. There are certain beliefs that have been supposed to be current among men in all ages. Of these, illustrations are found in the belief in an external, material world, independent of any mind to perceive it, in the universality of causality, and in the eternal obligation of morality. Every man of common sense, it is held, shares such beliefs. The philosophical acceptance of these beliefs as self-evident and beyond the reach of criticism is called commonsense philosophy. (See also DOGMATISM.) Thomas Reid (q.v.) was the most distinguished advocate of common sense as the final court of appeal on all matters philosophical, and he has been generally followed more or less closely by the philosophers of the Scottish school. (See SCOTTISH SCHOOL OF PHILOSOPHY.) The untenability of this position is realized as soon as it is recognized that common opinion has often been shown to be mistaken. Common sense is the starting point of philosophy, but not its final arbiter. And yet we find in the history of philosophy that there is a strong tendency, on the part even of independent thinkers, to make their views appear as those of the ordinary man. Thus Berkeley (q.v.) claimed that his idealism was in accord with common sense. This constant attempt of the philosopher to square himself with common sense shows the strong hold that popular belief has even upon the most original thinkers. Consult: Seth, *Scottish Philosophy* (Edinburgh and London, 1890); McCosh, *Scottish Philosophy from Hutcheson to Hamilton* (London and New York, 1875); Sidgwick, "The Philosophy of Common Sense," in *Mind*, N. S., vol. iv (London, 1895). See KNOWLEDGE, THEORY OF.

COMMON TIME. See TIME.

COM'MONWEALTH' OF AUSTRA'LIA. The federal union of the self-governing states of Australia, set up by Act of Parliament July 9, 1900, and proclaimed at Sydney, Jan. 1, 1901. See AUSTRALIAN FEDERATION.

COMMONWEALTH OF ENGLAND. The official designation of the government of England from the abolition of the monarchy, February, 1649, until the establishment of Cromwell's Protectorate, December, 1653. The title is generally applied to the whole period dating from the death of Charles I, Jan. 30, 1649, to

the restoration of Charles II, May 29, 1660. See CROMWELL, OLIVER.

COMMUNE' (Fr., district, from ML. *communa, communia,* district, from Lat. *communis,* common). The smallest administrative division of France and the unit of local self-government. The commune is a legal body and can buy and sell property, contract debts, and appear in the courts. The chief magistrate is the *maire* (mayor), who is assisted by one or more deputies and a deliberative assembly, called the *conseil municipal.* The *maire* unites in himself two general classes of functions resulting from the twofold nature of the commune. As the agent of the national government, he is charged with the local promulgation and enforcement of laws and decrees; and, as a member of the municipality, he has to attend to the police, the revenue, and the public works of the commune, and in general to act as the representative of the corporation. In communes which rank as the administrative centres of a department, arrondissement, or canton, or which have a population of more than 3000, the *maire* is nominated by the central government; elsewhere the appointment is made by the prefect of the department. The councilors are elected by the votes of the communal electors and hold office for five years.

COMMUNE. A term applied in feudal times to a body of burghers holding a charter granting them certain privileges of self-government. These communes were found in France, England, Italy, and elsewhere. On the character of these mediæval communes, consult Schröder, *Lehrbuch der deutschen Rechtsgeschichte* (Leipzig, 1907).

Commune of Paris (1792). The revolutionary municipal government established in Paris in August, 1792. It acquired immediate ascendancy in the Assembly, through the personal pressure its leaders could bring to bear, and as its power increased it became more and more the instrument of the violent element of the Revolution and dictated the policy of France. Its history became the history of the Revolution itself. On this commune consult Morse-Stephens, *History of the French Revolution,* vol. ii.

Commune of Paris (1871). This is commonly referred to when the term is used without qualification. It was the insurrectionary body, or organized mob, which was in possession and control of Paris from March 18 to May 27. The German army of occupation left Paris March 3, and almost immediately signs of revolt appeared. On the 18th the Reds, as the Communists were called, with the encouragement of the Internationale (q.v.), rose against the French regular troops and, supported by the National Guard, took possession of the city. Generals Lecomte and Clément Thomas were shot. Communal elections were held, and the authority of the National Assembly, which was sitting at Versailles, was declared null. Peace negotiations with Germany were held in abeyance until the new national government could establish its authority in France, and it was intimated that Germany might find it necessary to reoccupy the abandoned fortresses. Large bodies of the French prisoners held by Germany were released to reinforce the army at the disposal of the government for the suppression of the insurrection. The army was thus raised to 150,000 men, and on April 6 active operations were begun by the government forces under Marshal MacMahon, for the capture of Paris. The military administration of the Commune was notoriously incompetent, and insubordination and debauchery rendered the forces inefficient, but the available number of the National Guard approximated 100,000, and they were well armed and possessed strong fortifications, the reduction of which was not a light task. The siege of the city was pushed with energy, for the credit of the new Republican government of France before the world hung upon its ability to maintain its authority. Before the middle of May it became evident that the Commune could not hold out much longer, and its followers began to resort to acts of vandalism. The residence and library of Thiers were destroyed, and the Vendôme Column pulled down. The government forces penetrated the defenses of the city on May 21 and obtained possession of Montmartre and now was enacted that saturnalia of violence and crime which has made the name of the Commune infamous. On May 24 the Communists set fire to the public buildings, the palace of the Tuileries being destroyed. On the same day a large number of hostages, including M. Darboy, Archbishop of Paris, were massacred. On May 27 the last hand-to-hand struggle, without quarter, was fought in the cemetery of Père-Lachaise. On the following day all resistance came to an end, and the reign of the Commune was closed. The Communal Council, the governing body of the Commune, was organized in 10 committees, of which that for finance was the most efficient. At the head was a general executive committee, the authority of which was never great. It was displaced by a committee of public safety, which was expected to exercise dictatorial power, like its Revolutionary prototype; but this, too, proved a failure. The Commune was essentially lawless. Many of those who initiated the movement were honest theorists and enthusiasts, but the forces they called into action were entirely beyond their control. There is no scientific history of the Commune. The principal work is Du Camp, *Les convulsions de Paris* (4 vols., Paris, 1878–79), conservative. Of Communist sympathies are Arnould, *Histoire populaire et parlementaire de la Commune de Paris* (3 vols., Brussels, 1878), and Lissagaray, *Histoire de la Commune* (last ed., Paris, 1896); there is an English translation by Aveling of an earlier edition (1886). Consult also Washburne, *Recollections of a Minister to France* (2 vols., New York, 1887); Simon, *The Government of M. Thiers* (2 vols., ib., 1878); Fetridge, *Rise and Fall of the Paris Commune of 1871* (ib., 1871); March, *History of the Commune of 1871* (London, 1896); Margueritte, *La commune* (Paris, 1904). See FRANCE; FRANCO-GERMAN WAR.

COMMU'NICA'TIO ID'IOM'ATUM (Lat., communication of peculiar properties). A term of ancient, and also of Lutheran, Christology, denoting that each of the two natures of Christ, divine and human, imparts its peculiar properties to the other, so that the properties of the divine Word can be ascribed to the human Christ, and the human properties to the divine Christ. Consult Thomasius, *Die Christliche Dogmengeschichte,* vol. ii (Erlangen, 1874–76). See CHRISTOLOGY.

COMMUNICATION, CONFIDENTIAL OR PRIVILEGED. See PRIVILEGED COMMUNICATION.

COMMU'NION (Lat. *communio*, participation, from *communis*, common). In ecclesiastical language, that relation, involving mutual claims and duties, in which those stand who are united by uniformity of belief in one religious body or church. To exclude from this relation and its involved rights is to *excommunicate*. The most visible symbol of this relation being the partaking together of the Lord's Supper, that rite is often called the Communion. See LORD'S SUPPER; and, for communion table, ALTAR.

COMMUNION IN BOTH KINDS. A term of theology, implying that, in the celebration of the Lord's Supper, communicants partake of both the bread and the wine. It is universally acknowledged that in the primitive Church both the bread and the cup were distributed to all who communed. Sects which, like the Manichæans, discarded the wine, were condemned as irregular. Early popes commanded the use of both kinds (e.g., Gelasius I, 492–496). As, however, there was frequent occasion to carry the consecrated elements from the church to sick persons at their homes, it became customary, for convenience, to dip the bread in the wine, administering in this way both in one. As early as the third century communion of the sick seems to have often been with bread only. In the thirteenth century Robert Pulleyn, of Oxford, approved the custom of giving to the laity the bread only, in order, as was said, to avoid the danger of spilling the wine. This view was adopted by the scholastic theologians, who taught that Christ was wholly present in the sacrament under either form, and that, consequently, one form was sufficient for a valid observance of it. Thomas Aquinas and Bonaventura, especially, advocated the administration of the communion under one form only. As this view predominated in the course of time, it became the practice of the Church in the West to withhold the cup from the laity. Against this the heretics of the Middle Ages, as the Waldenses, and especially the Hussite sect of Calixtines (Utraquists), protested, but the Council of Constance defended the custom. The Protestant churches were united in regarding the communion in both kinds as essential to the right observance of the ordinance. The practice of the Roman Catholic church was confirmed and made binding by the Council of Trent in 1563. It is defended on the ground that the cup is not necessary to the completeness of the sacrament. Since the whole Christ, as to His body, soul, and divinity, is not only in each species, but in every particle of both, he who receives the consecrated bread receives the whole Christ. See LORD'S SUPPER.

COM'MUNISM (Fr. *communisme*, from *commun*, joint, common, from Lat. *communis*, common). A system of society in which private property, at any rate, in the means of production is abolished and all or practically all goods are held in common, the needs of each individual being supplied from public sources. Communism, in its broadest sense, is the economic basis of socialism (q.v.). It is also the economic basis of anarchism (q.v.). The term is, however, usually restricted to various non-political communities organized on a basis of common ownership and to the principles upon which they rest. Communism in this sense was an early form of economic organization; in most parts of the world it probably antedated private property and still survives in many primitive societies. The Russian Mir is in large measure a communistic organization. Primitive communism was often kept alive, after the introduction of private property, by religious organizations. In ancient Palestine the Essenes and Therapeutæ held property in common. Much is said about the communism of the early Christians. A certain degree of it existed, but it seems not to have been universal, many Christians retaining their private property. In any case the institution did not long endure. The ascetic tendencies which often manifested themselves in communistic forms among heretical and orthodox sects were introduced into the West from the East. Before an inquisition at Turin in 1030 a heretic declared: "We hold all our goods in common with all men." Other heretical sects, the Catharists (eleventh century) and the Apostles (thirteenth century), held similar views. The Brothers and Sisters of the Free Spirit held that, before the fall, men were like God, that paradise must be reintroduced with community of goods and of women. Many evil stories are told of their proceedings, and they were opposed by the Inquisition, but spread in secret during the fourteenth and fifteenth centuries. With these may be compared the Adamites of the fifteenth century. The great monastic orders also present many communistic traits.

During the fifteenth and sixteenth centuries the Taborites (Hussites), the Moravians, and the Anabaptists arose and flourished in succession in central Europe. (For detailed descriptions, the reader is referred to separate articles under these heads.) The teachings of the Anabaptists were embodied, in Thuringia, in a popular movement to realize a state without government, law, or property, each to receive according to need, "omnia simul communia." This and the attempt at Münster to establish the new Zion were forcibly put down. Communistic societies with a religious basis were formed in considerable numbers in eighteenth-century Europe and became still more numerous in the nineteenth century, especially in America, many of them still surviving. The later communities, however, drew their inspiration from the philosophic social reformers, or Utopists, as well as from religion.

Of philosophic utopianism the first important example is the ideal republic of Plato. In Plato's state political functions were to be restricted to the two upper classes, the philosophers and the guardians. Among these Plato proposed that community of wives and wealth should be the rule, in order that the disorders attendant upon a régime of private interest might be obviated. Plato's scheme was far from communism in its present meaning, since the middle class of traders and artisans were to retain private property and the institution of the monogamic family, and since it premised the existence of slavery. Its influence upon modern communism was exerted through the work of Plato's imitators, Sir Thomas More and Thomas Campanella. More, influenced by Plato, proposed to retain slavery, the slaves being chiefly convicted criminals. There should be community of goods; every one should be supplied from the state storehouses. Monogamy is prescribed, and the greatest freedom allowed the individual families. Men and women are to work six hours per day. The title of More's book *Utopia* has given the name to all such pro-

posals. More has been followed by many writers. Campanella (*Civitas Solis*, Frankfort, 1623) advocated community of goods and of women, with universal duty to labor four hours a day, each person to be provided according to need. Vairasse (*Histoire des Severambes*, 1677) proposed an eight-hour working day. Among the most interested Utopistic efforts is the charming story by Cabet, *Voyage en Icarie* (1842), in which monogamy is preserved, each person working according to ability and receiving an equal reward. Cabet's attempts to realize his dreams will be mentioned later. Bellamy (*Looking Backward*, 1888) advocated wages in the form of annual credits at the public warehouse, at which goods are sold according to the quantity of labor required in their production. Hertzka (*Freiland*, Leipzig, 1890) and Sheldon (*In His Steps*, 1899) may also be classed here, as well as H. G. Wells, *A Modern Utopia* (1905). The work of Wells is especially interesting in that it represents a reaction towards an aristocratic communism. Administrative functions, in Wells's scheme, are concentrated in a body of "Samurai," bearing important analogies to Plato's upper classes of philosophers and guardians.

Mention should also be made of certain critics of the system of private enterprise who proposed communism as a remedy for its evils, although they did not elaborate ideal plans of social reorganization. Among these was Meslier (1664–1729). In his *Testament* (published in 1864) Meslier described society as a product of force, and its evils as the results, largely, of private property. The various parishes should form large families bound mutually to assist one another, each individual to have according to his needs. Morelly (*Code de la Nature*, 1755) advocated communities of about 1000 persons with common goods and distribution according to need.

The Utopists were essentially romancers and made no effort towards the realization of their ideals in practical institutions. A practical movement in the direction of communism was instituted in France by Saint-Simon and Fourier. Fourier's plan of organization, while providing for life and labor in common, sought to preserve the essentials of private property. With Louis Blanc, French communism assumed practically the character of socialism, relying upon the state rather than upon coöperative effort to effect social reform.

Among the leaders of the communistic movement in the early nineteenth century perhaps the greatest was Robert Owen. At the outset of his career Owen was merely a philanthropic manufacturer who believed that the lot of the worker could be rendered quite tolerable at no ultimate cost to other classes in society. Later he was forced to the conclusion that reforms under the existing economic system could give only temporary relief, and advocated the formation of coöperative groups of 500 to 1000 persons, owning land and tools in common and sharing the products of labor according to need. Such groups, or colonies, he believed, would be so efficient, and life in them would be so agreeable, that all workmen would desert to them, and the existing industrial system would break down of itself. In 1819 he attempted to start such a colony at Motherwell, but the funds were not sufficient. In 1824 Owen came to America, where his presence did much to start a wave of communistic thought, and where some 14 colonies were planted, none of which lasted more than a few years. During his absence (1826) some of his friends purchased 291 acres of land at Orbiston, near Glasgow, and built a large building in which all should live, each sharing in the division according to his labors. The death of one of the founders, with other difficulties, brought an end to the plan. Similar colonies at Rahaline, in the thirties, and Queenswood (1841) likewise failed, the latter after five years' existence.

Communistic Societies in America. The conditions of economic life in the United States have been especially favorable to the foundation of communistic societies, both social and religious. Cheap land and freedom from hampering political regulations have been the chief favoring conditions. In 1774, driven by religious opposition, "Mother Ann Lee" came from England with a small company of Quakers, who were called Shaking Quakers because of certain physical movements in religious exercises. The name was soon shortened to Shakers. They settled at Watervliet, near Albany, N. Y. Mother Ann died in 1784. In 1787 a covenant was adopted establishing celibacy and community of goods. Their communism grew out of their religion. Christianity, they say, does not admit of divisions into rich and poor; "mine" becomes "ours," and riches and poverty, with their misery, disappear. The Shakers have lived happily and contentedly and have had great material prosperity. They have now some 15 societies in different States, the largest being at Mount Lebanon, N. Y. They number about 700 and own much land. Their aggregate property has been estimated at $10,000,000, but it is not managed so as to yield considerable returns. (See SHAKERS.) The Harmonists, or Separatists, as they were called in Germany, left the Fatherland because of sectarian opposition and settled in 1803 at Harmony, Pa., under the leadership of George Rapp. They, too, have been very successful financially. At one time they had 1000 members, but now less than five remain. They employ outsiders to carry on their enterprises, so that they have practically become a close corporation. See HARMONISTS.

The Amana Community of seven villages in Iowa was founded by another German sect, the Inspirationists, who settled near Buffalo, N. Y., in 1842, moving to Iowa in 1855. Religion is the primary thing. They have prospered and possess fertile and well-improved lands. They number 1700 or more. (See AMANA.) In 1844 Dr. Keil founded the Bethel Community in Shelby Co., Mo. The community prospered, numbering at one time 1000 members, and formed several branch communities in the same State. It was dissolved in 1880, but some of the members removed to Oregon, where Dr. Keil had formed another community known as Aurora. This colony, however, was also dissolved in 1881. Under the leadership of Cabet a large group of French communists attempted in 1848 to form a community in Texas and later in Illinois. They were finally settled at Icaria, Iowa, where they prospered for many years, but were disbanded in 1895. See ICARIANS.

All of these communities were started by foreigners, though most of the Shakers have been Americans. An American colony of some 50 members was started by John Humphrey Noyes in 1848 at Oneida, N. Y. Later a small branch

was established at Wallingford, Conn. They believed in freedom from sin and were called "Perfectionists" (q.v.). Between 1840 and 1850, under the leadership of Albert Brisbane, Horace Greeley, Charles A. Dana, and others, Fourierism spread over the country, Greeley advocating it in the New York *Tribune*. Some 27 "phalanxes" were started in various places, most of which were short-lived. The most famous was Brook Farm (q.v.). The North American Phalanx, in Monmouth Co., N. J., was the most successful, lasting some 12 years (1843–56). Ripon, Wis., dates back to the Wisconsin Phalanx of 1844. This association paid $1.08 on the dollar when it dissolved.

In recent years a number of attempts to found communistic settlements have been made. Among these may be mentioned Ruskin Cooperative Colony, founded in 1894 and closed in 1902; the Christian Commonwealth of Georgia (1896–1900); the Freedom Colony of Kansas (1897–1905); Equality (Wash.), founded by the Brotherhood of the Coöperative Commonwealth in 1895, the name being changed to Freeland in 1905. Lack of unity and unwise management have been the chief reasons for the failure of communistic societies. The communities having the longest life have all been under the influence of religious ideals powerful enough to check dissension. Of such communities Ephrata, the Harmonists, and the Shakers have existed over a century. Of the religious communistic societies that have disbanded, the average life has been about 24 years; the Owenite societies lived on an average less than a year and a half; the Fourieristic societies, two years and a half. Societies organized in the last 25 years have endured, on an average, four years. A common cause of the failure of religious communities has been the death of the founder and failure to find another religious leader with personality sufficiently powerful to check the growth of discontent. Contrary to popular belief, the communistic societies of the last century have been troubled very little by idlers. Nor has great difficulty arisen over the apportionment of tasks. Troubles that have arisen are of a more purely personal nature: discontent with leaders, restiveness under discipline. In many communities the secession of the young, attracted away by opportunities for individual success, has been a chief cause of ultimate failure. Some of the most successful communities have been celibate, as, e.g., the Shakers, and have found increasing difficulty in securing enthusiastic recruits with the change in the spirit of the times.

The failure of most communistic societies and the very moderate success of those that survive are frequently assumed to be proof of the impracticability of any scheme of communistic organization. Socialists urge that no conclusions can be drawn from the experience of such societies. Economically they hark back to primitive conditions. They seek to be as nearly self-sufficing as possible; they make little use of modern improvements in production, and hence labor hard for small results; they attempt to cultivate asceticism, as a rule, and hence life in them becomes irksome to those who are not bound to them by strong religious convictions. The communism desired by modern socialists is that of a great state, not that of a petty community. There is no reason why a communistic state should not employ all known improvements in production, nor why life in it should be narrow and ascetic. Furthermore, a communistic state might keep within it the abler and more enterprising spirits, but a small communistic group cannot keep these from drifting away.

Consult Kautsky, *Communism in Central Europe at the Time of the Reformation* (London, 1897); Stammhammer, *Bibliographie des Sozialismus und Kommunismus* (Jena, 1893–99); Stegman-Hugo, *Handbuch des Sozialismus* (Zurich, 1897); Ely, *French and German Socialism* (New York, 1883); Nordhoff, *The Communistic Societies of the United States* (ib., 1875); Ely, *The Labor Movement in America* (2d ed., ib., 1890); Noyes, *History of American Socialisms* (Philadelphia, 1869); Shaw, *Icaria* (New York, 1884); Lockwood, *The New-Harmony Communities* (Marion, Ind., 1902); Bushee, "Communistic Societies in the United States," in *Political Science Quarterly* (Boston, 1905); Hinds, *American Communities* (Chicago, 1908). See SOCIALISM.

COM'MUNIS'TIC SOCIETIES. See COMMUNISM; also AMANA; BROOK FARM; EPHRATA; KORESHAN ECCLESIA; PERFECTIONISTS; SEPARATISTS; SHAKERS; ZOAR COMMUNITY.

COMMU'NITY OF PROPERTY. In the civil law, a form of partnership or common ownership of property by husband and wife. It covers all personal property owned by either party before marriage or acquired during marriage, all realty and all profits and rents acquired or accruing during marriage. Property given to either by deed of gift in which the donor specifically makes it the exclusive property of the donee is exempt from the operation of the doctrine. The survivor takes one-half the property after their joint debts are paid and also has certain homestead rights. The heirs of the deceased spouse take the remaining half, subject to the survivor's homestead rights. This doctrine was introduced from the French and Spanish law into some of the southern and western States, including Louisiana, Washington, Texas, and California, but is generally regulated and somewhat modified by statutes. (See HUSBAND AND WIFE; GANANCIAL SYSTEM.) The expression "community property" is sometimes used to describe the holding of property in common by communistic societies, such as the Shakers. In such communities there is a sort of general partnership in all property, each adult individual owning an equal share by virtue of his membership. The ownership is in the nature of a tenancy in common and is not subject to the rules of the civil law above described.

COM'MUTA'TIONS. A military term. See ALLOWANCE; PAY AND ALLOWANCES.

COMMU'TATIVE LAW. See ASSOCIATIVE LAW.

COM'MUTA'TOR. See DYNAMO-ELECTRIC MACHINERY.

COMNE'NUS (Lat., from Gk. Κομνηνός, *Komnēnos*). The name of a family, originally from Paphlagonia, of which several members occupied the throne of the Byzantine Empire, from 1057 to 1204, and that of Trebizond, from 1204 to 1461. After the fall of Constantinople one branch of the family settled in Saxony, another in Corsica; but the attempt which has been made to trace the descent of the Bonaparte family from a branch of the Comneni is not supported by valid evidence. See ALEXIS; ANNA COMNENA; BYZANTINE EMPIRE.

CO'MO (Lat. *Comum*). The capital of the province of the same name in Lombardy, north Italy, picturesquely situated at the southwestern end of Lake Como, at a distance of 28 miles north of Milan (Map: Italy, D 2). The old town is surrounded by walls which form a rectangle as in Roman times. The city is surrounded by garden-covered hills and groves and contains some very beautiful buildings. The marble cathedral, begun in 1386, belongs to different periods and is built in many styles. Begun in the Gothic at the end of the fourteenth century, the larger portion was constructed in fifteenth-century Renaissance style, mostly by Rodari, while the dome is of relatively recent origin. The interior is decorated with rare pictures and monuments; in the main entrance are placed two statues of Pliny the Elder and the Younger, natives of Como. The basilica of S. Abondio, a building of Lombard origin, rebuilt in the eleventh century and recently restored, dates from the eleventh century. Near by is the church of S. Carpoforo, also the ruined castle of Baradello. The church of Santissima Annunziata, situated on the promenade outside of the town, is also remarkable for its rich decorations of marble and gold. Adjoining the cathedral is the city hall, a large, arcaded structure, built of different-colored stone, and completed in 1215. Other noteworthy buildings are the theatre, built in 1813; the lyceum, founded in 1824; and the city museum, opened in 1897, with its collections of Roman antiquities, arms, and coins. Since the early Christian era it has been a suburban resort. Como has extensive manufactures of silk, velvet, knit ware, optical glasses, shoes, stockings, and metal work. The commerce is also of considerable importance.

The ancient Comum was a city of the Insubres, occupied by the Romans in 196 B.C., and colonized by Cæsar as a military post to repress the Alpine tribes. In the Middle Ages it was a stronghold of the Ghibellines and the "open door of the emperors into Italy." In 1127 it was destroyed by the Milanese and rebuilt by Frederick I in 1159. Later it was ruled by the Rusca family and in 1335 came into the possession of the Visconti, from which time it shared the fortunes of Milan. In 1859 it was a centre of the agitation headed by Garibaldi.

Como is the seat of a bishop and the birthplace of Innocent XI and Clement XIII, the historian Giovio, and Volta, the physician. Pop. (commune), 1881, 25,560; 1901, 38,895; 1911, 43,439.

COMO, LAKE (It. *Lago di Como*, or *il Lario*, Ger. *Comer See*, anc. *Lacus Larius*, praised by Vergil, *Georg.* ii, 159). The most beautiful and celebrated of the Italian lakes, situated in Lombardy, at the western foot of the Bergamese Alps, 30 miles north of Milan (Map: Italy, D 2). Its elevation is 650 feet; its area, about 55½ square miles; its greatest length, 43 miles; its greatest width, not quite 3 miles; and its greatest depth, 1365 feet. The southern part divides, at Bellaggio, into two arms—the eastern called Lake Lecco, the western retaining the name "Lake Como," and having the city of Como (q.v.) at its extremity. Between these two arms lies the fruitful District of Brianza. The river Adda enters the northern end of the lake and leaves at the southeastern extremity, near the town of Lecco. The beauty of Lake Como has long been extolled. The luxuriant landscapes are embellished by costly villas, with gardens, terraces, and vineyards, of wealthy families that have been attracted from many countries by the delightful region and the indulgent climate. The lake is especially the resort of the Milanese aristocracy. A number of the villas, possessing worthy art collections (including particularly several fine examples of Thorwaldsen and Canova), are opened regularly to visitors. The most attractive towns on the lake are Cernobbio, Tremezzo, Cadenabbia, Menaggio, Bellano, and Bellaggio. The steamboat service is excellent. The inhabitants along the shore are chiefly engaged in silk production and manufacturing. Fish are plentiful and of many varieties. The lake partially occupies a fold in the limestone formation of the foothills of the Alps. This depression is traceable in the contours as far as Chiavenna, for Lake Mezzola is really a continuation of Como, though now separated therefrom by the silted delta of the Adda.

COMONFORT, kō'mōn-fôrt', IGNACIO (1812–63). A Mexican statesman. He was a member of Congress in 1842 and a Senator six years later. In 1854, in the uprising against Santa Anna, he aided Álvarez, whose Minister of War he became. Soon after, upon Álvarez's abdication (1855), he became provisional President. He was proclaimed President in 1856, and instituted some important democratic and anticlerical reforms. But he was too generous to his foes and trusted too much in their pledges, and in 1858 was driven into exile. He returned to Mexico in 1861, offered his services to Juárez and the Republic for the approaching struggle between Republicans and Imperialists, and was appointed general, with the command of the fortress of Zaragoza. In 1863 he commanded an army to oppose the French invaders who intended to establish the Emperor Maximilian in power, was defeated by Bazaine near Cholula, and shortly afterward was killed in an ambuscade by bandits.

COM'ORIN. See CAPE COMORIN.

COMORN, kō'mōrn. See KOMORN.

COM'ORO ISLANDS. A group of four large and a number of smaller islands in the Mozambique Channel, midway between Africa and the northern end of Madagascar, lying between lat. 11° and 13° S. and long. 43° and 45° 30′ E. (Map: Africa, J 6). The four larger islands are Great Comoro, Johanna, Mohilla, and Mayotte. They have a total area of 760 square miles. They are of volcanic origin and mountainous; the highest peak, 8500 feet high, on Great Comoro, is still an active volcano. The soil is fertile and produces coffee, cotton, sugar, vanilla, cloves, and coconuts. Cattle are also raised to some extent. The manufactures are coarse cloths, jewelry, and cutlery. The island of Mayotte was ceded to France in 1842, and a protectorate extended over the remaining ones in 1886. The group is ruled by native sultans, who are under the supervision of a French governor residing at Mayotte. The population is estimated at about 65,000, of mixed Arabic, Malagasy, and negro descent, professing Mohammedanism, but practicing fetichism.

COMOX. A coast tribe of Salish Indians in British Columbia. See SALISHIAN STOCK.

COMPAGNI, kôm-pâ'nyê, DINO (c.1260–1324). A Florentine historian and statesman of the fourteenth century. Of plebeian origin, he was a member of the silk guild, and in the rise of the populace to power he played an impor-

tant rôle as *consol* of his guild (1282–99), as reformer of the constitution (1282), prior (1289), and *gonfaloniere* (1293). As prior again in 1302, he opposed Pope Boniface and Charles of Valois, but escaped on a technicality the ruin which overtook Dante and the other *Whites* at that time. (See DANTE.) His *Cronaca delle cose occorrenti ne' tempi suoi* was written in 1310–12, probably inspired by the hopes aroused in the *Whites* by the descent into Italy of Henry VII. This narrative deals particularly with the events of 1300, the formation of the Black and White parties, the antecedent history of Florence from 1280, and the subsequent results down to 1312. Frequent errors of fact and the omission of several important episodes which Compagni must have known occasioned (1858–75) a polemic as to the authenticity of the *Chronache*. Compagni's authorship was, however, definitively established by Isidoro del Lungo (*D. C. e la sua cronaca*, Florence, 1879–87), who shows that the Chronicle is not a work of research nor of patient, dispassionate historical interpretation, but is dominated by the feelings of a great personality, which explains its inaccuracies as well as its fiery vigor, its Dantesque objectivity, its healthy emotionality. To Compagni have likewise been attributed, but inconclusively, the *Intelligenzia*, an allegorical poem in *nona rima* and some verses in the manner of the Provençal school.

COMPAGNONNAGE. See GUILD.

COMPAN'ION (Dutch *kompanje*, Fr. *compagnie*, company, crew; influenced in popular etymology by Eng. *companion*, comrade). The skylight or cover to quarter-deck hatches through which the light passes to the deck below. Companions are usually removable. With the disappearance of old-fashioned ships, the name has fallen into disuse. The *companion ladder* is the ladder leading from the quarter-deck to the deck below, and the *companionway* is the hatch (together with its deck house, if there be any) through which the companion ladder leads.

COM'PANY (from Fr. *compagnie*, OF. *companie*, It. *compagnia*, from Lat. *com-*, together + *panis*, bread). A number of persons associated together in a joint enterprise, usually of a mercantile character. A company may be incorporated by public authority, in which case it is known as a corporation aggregate, or it may be unincorporated, when it is called a voluntary association.

Any group of two or more persons acting together under joint direction for a common purpose may constitute a company, but it is only when incorporated that the association as such acquires an independent legal status as an artificial person, capable of suing and of being sued like a natural person. In England the term "company" is generally employed to describe two great classes of associations, viz., (1) joint-stock companies, instituted and organized under the Companies Acts (1862–1900), and (2) public companies, existing by virtue of special acts of Parliament for carrying on certain undertakings of public utility, such as railways, water works, and the like. These are not usually incorporated in England, but are in effect large partnerships trading on a joint stock with transferable shares. Consult *Encyclopedia of the Laws of England*, vol. iii, p. 253 (London, 1907); Lindley, *Companies* (5th ed., London); Buckley, *The Companies Act* (8th ed., London); Healey, *Joint-Stock Companies* (London). In the United States associations of either sort are almost invariably incorporated either by special charter or under general laws. See CORPORATION.

Chartered Companies. As a legal term, "company" was first employed in connection with the great chartered companies of the period of adventure and exploration in England during the fourteenth to the seventeenth century. The essence of these companies was the possession of certain exclusive privileges conferred by royal charter, either a monopoly of trade with certain countries or regions of the earth, or more or less extensive power of colonization and government; or, as was usually the case, a combination of the two. These companies were of two distinct types, viz., the trading company, to which individual merchants were admitted on certain conditions, and then traded each on his own account; and the joint-stock company, in which the trade was carried on in behalf of all its members by the managing board and officers of the company. The latter might be either incorporated (in which case it differed only in the extent of its powers and the character and range of its operations from the modern business corporation), or unincorporated (in which case it was simply a great partnership, of the type known to us as a joint-stock association). In all cases, however, it was usual to vest in the company, or in its officers or managing directors, legal jurisdiction over its members, and, in the case of the colonizing companies, a territorial jurisdiction as well. The famous company, known as the Merchant Adventurers of England, whose beginnings can be traced back to the year 1359, was originally of the type of trading companies, but was incorporated 200 years later by a charter of Elizabeth. The Eastland Company, the Russia (or Muscovy) Company, the Levant (or Turkey) Company, were of the same character. The great colonizing companies under whose auspices the first English settlements in the New World were made—as the Virginia Company, chartered in 1609; the Massachusetts Bay Company, chartered in 1629—were of a composite character, being incorporated for the express purpose of founding new colonies, but organized for trading purposes on the principles of the regular trading companies. The East India Company, on the other hand, chartered in 1600 as a trading company, pure and simple, became a joint-stock company in 1612, and the Hudson's Bay Company, incorporated by royal charter in 1670 (which, shorn of most of its ancient privileges, is still in active existence), is also for trading purposes a joint-stock association.

The extensive powers of government, and even the legal jurisdiction over their own members, formerly vested in these old trading companies, have long since been resumed by the crown. Their present significance lies in the fact that they constitute the beginnings and the foundation of the colonial empire of Great Britain. But the principles on which they were organized and conducted are, with some modifications, still recognized and acted upon in that country. Chartered companies for purposes of trade and colonization in territories not under the sway of Christian powers are still created, and some such companies of recent origin have played an important rôle in the history and politics of the past 20 years. Among these may be mentioned the North Borneo Company, chartered in 1881; the Royal Niger Company, in 1886; the British

East Africa Company, in 1888, and the British South Africa Company, in the same year. All of these companies have had qualified rights of sovereignty and powers of government vested in them, and they have all continued the rôle of the older companies in expanding the limits of the British Empire. See Anderson, *Origin of English Commerce;* Cunningham, *Growth of English Industry and Commerce;* Schanz, *Englische Handelspolitik;* Cawston and Keane, *Early Chartered Companies;* Westlake, *International Law* (London, 1880); Hall, *Treatise on the Foreign Powers Jurisdiction of the British Crown* (Oxford, Eng., 1894); and the comprehensive treatise of Bonassieux, *Les grandes compagnies de commerce* (Paris, 1892); Davis, *Corporations: Their Origin and Development* (New York, 1905); Unwin, *Industrial Organization in the Sixteenth and Seventeenth Centuries* (Oxford, 1904).

City Companies. The incorporated trades or guilds of the city of London. The origin of these companies is to be traced back to the close organization and exclusive membership of the mediæval craft or trade guilds, which appeared in England in the early part of the twelfth century. These had various privileges conferred upon them from time to time by royal charter until in the latter part of the fifteenth century they exercised all the powers of government within the city of London and, indeed, constituted its entire citizenship. Thereafter the "freedom of the city" consisted in membership, as a "liveryman," or "freeman," of one of the city companies, and the franchises of the city were exercised in this fashion until 1725, when the companies were deprived of some portion of their political authority by Act of Parliament. They were further restricted by the reform legislation of 1832 and 1867, but still retain the right of choosing the lord mayor, the sheriffs, chamberlain, and other civic officers. Though the companies have by lapse of time entirely lost their trading character, they still retain their ancient organization, many of their exclusive privileges, and, in some cases, great wealth. There survive 12 great companies and 60 lesser ones. See GUILD; LONDON; and consult Brentano, *Guilds;* Gross, *Gild Merchant;* Norton, *The City of London* (London, 1829); and *Report of the Royal Commission on the Livery Companies* (Parliamentary Papers, 1884); Ditchfield, *The City Companies of London and their Good Work* (London, 1904); Unwin, *The Guilds and Companies of London* (ib., 1908).

Modern Trading Companies. In a legal sense, the term "company" may be applied to any association of individuals for business purposes. This may be a partnership of the ordinary type, a joint-stock association—which is commonly a large partnership formed and conducted in ways prescribed by statute—or a business or trading corporation. It is in the last sense that the term is commonly employed in England. In the United States it has no such definite legal signification. Though there is no inappropriateness in applying it here to any of the three forms of association above enumerated, it usually refers to the second or third form. The expression "company law" may have reference either to the law of business corporations or of unincorporated associations. All of these forms of association for trading purposes are dealt with under their respective heads. See CORPORATION; JOINT-STOCK ASSOCIATION; PARTNERSHIP; VOLUNTARY ASSOCIATION, and the titles and authorities referred to thereunder.

COMPANY. In military organization, an aliquot part of a regiment or battalion, though not absolutely or necessarily so. In the United States all infantry regiments, the three battalions of engineers, and the coast artillery corps, are divided into companies. For duty in the field signal and sanitary troops are also organized as companies. A company of infantry has three officers, a captain, one first and one second lieutenant. Troops of cavalry and batteries of artillery generally correspond in command and organization to companies of infantry. The average war strength of companies in the United States and British armies is 100 men. On the continent of Europe the number varies from 100 to 250 men in Germany and Russia. In the former country the captain of infantry is a mounted officer and has three subaltern officers under his command. The general trend of modern military tactics is to reduce the size of the unit of command in attack formations, largely because of the vast area over which comparatively small bodies of troops are scattered, and the corresponding difficulty of their effective control; thus the importance which heretofore has attached to the regiment or battalion is likely to attach to the company and greatly alter its present formation and organization. See ARMY ORGANIZATION; TACTICS, MILITARY.

COMPANY, JOHN. The popular name for the old East India Company (q.v.).

COMPANY, SHIP'S. All persons who are regularly employed in various capacities on board a ship. In the United States navy it is also frequently used to designate the crew only. See COMPLEMENT; CREW.

COMPARATIVE ANATOMY. For definition, scope, and bibliography, see ANATOMY, and ANATOMY, COMPARATIVE. In this work all the larger topics dealing with the anatomy and physiology of men and animals have been treated comparatively and with reference to their evolution. Such is the character of ALIMENTARY SYSTEM; CIRCULATORY SYSTEM; EAR; EXCRETORY SYSTEM; EYE; FOOT; HAIR; HAND; INTEGUMENT; MUSCULAR SYSTEM; NERVOUS SYSTEM; PELVIS; REPRODUCTIVE SYSTEM; RESPIRATORY SYSTEM; SKELETON; SKULL, and similar articles, in which the reader will find the methods of comparative anatomy exemplified.

COMPARATIVE GRAMMAR. See GRAMMAR.

COMPARATIVE MYTHOLOGY. See MYTH; MYTHOLOGY.

COMPARATIVE PHILOLOGY. See PHILOLOGY.

COMPARATIVE PSYCHOLOGY. See ANIMAL PSYCHOLOGY.

COM'PARA'TOR (Lat., comparer, from *comparare,* to compare, from *com-,* together + *par,* equal). An instrument used in comparing the lengths of two graduated scales or standards of length, and in determining accurately the amount of their difference. It consists essentially of two microscopes, each fitted with cross hairs and capable of being moved by a micrometer screw, or else supplied with a micrometer eyepiece, or often both. (See MICROMETER.) These micrometer microscopes are so mounted that they may be moved both laterally and forward and backward, and through them the observer looks down on the scale which is being examined. The microscopes are then

moved so that their cross hairs are either at the end or over some division of the scale, which often is so magnified that in making a setting it is convenient to bisect the enlarged image of the mark. By means of rollers or other mechanism the platform containing the first scale is temporarily removed and a second introduced in its place. In this case the intersections of the cross hairs are probably some small distance away from the corresponding division of the other scale, and this amount, as determined with the micrometers, is their difference at that temperature. While the operation of comparing two scales does not seem particularly complicated, nevertheless, in order to secure the desired high degree of precision, elaborate precautions are taken both in the construction and manipulation of the apparatus. The temperature at which the scales are compared is of course no unimportant consideration, and in order that this should be uniform and easily determined, they are immersed in a bath of liquid whose temperature can be maintained at some constant point or measured to a high degree of precision. In the comparison of standards there must of course be an ultimate standard to which all measures of length are referred, and this bar is defined as correct at some one stated temperature, usually taken at that of melting ice. Copies of the original standard are made and serve as secondary standards whose coefficient of expansion, minute errors, and other constants are known. Such comparisons are performed by the International Bureau of Weights and Measures at Paris, where comparators, with massive pedestals to carry the micrometer microscopes, and susceptible of the most accurate results and possessing all possible refinements, are employed. (See WEIGHTS AND MEASURES.) Similar but usually less precise apparatus is found also in the various national standards bureaus and physical laboratories. The comparator in the division of weights and measures of the United States Bureau of Standards at Washington consists of a massive beam of invar steel carried on brick piers to which the micrometer microscopes are clamped. The *Mémoires du Bureau International des Poids et Mesures* (Paris) contain full and technical descriptions of the most accurate and approved apparatus and methods. Consult also Fischer, "Recomparison of the United States Prototype Meter," in *Bulletin of the Bureau of Standards*, vol. i, No. 1 (Washington, 1904), and Hallock and Wade, *Evolution of Weights and Measures and the Metric System* (New York, 1906).

COMPARETTI, kōm'pȧ-rĕt'tē, DOMENICO PIETRO ANTONIO (1835–). An Italian philologist, born in Rome. He devoted himself at first to mathematics and the natural sciences. Later, having studied Greek by himself, he became, in 1859, professor of Greek in the University of Pisa. A few years later he accepted a similar position at Florence and afterward went to Rome, where he conducted the lectures on Greek antiquities at the university and studied carefully the excavations in the Forum. Aside from his Greek studies, he is distinguished as a scholar in Romance philology and in the culture history of the Middle Ages. His most important works are: *Saggi dei dialetti greci dell' Italia meridionale* (1866); *Virgilio nel medio evo* (1872; Eng. trans., 1899); *Papiro ercolanese* (1875); *La commissione omerica di Pisistrato e il ciclo epico* (1881); *Iscrizione arcaica del foro Romano* (1900). He wrote also on Pindar, Sappho, and Hyperides, and on the Gortynian law code. (See GORTYNA.) With D'Ancona he edited *Conti e racconti del popolo italiano* (9 vols., 1870–91); with others he edited the *Rivista di filologia e d'istruzione classica*. After 1884 he was editor also of the *Museo italiano di antichità classica*.

COMPAR'ISON (OF. *comparaisun*, Fr. *comparaison*, from Lat. *comparatio*, from *comparare*, to compare). In grammar, and as applied to adjectives (q.v.), that which marks the degree in which the quality is attributed to the object, as compared with other objects. There are three degrees of comparison. The positive indicates the quality generally, without comparison; the comparative, a higher degree of the quality than is attributed to other things; and the superlative, the highest degree that is attributed to any of the things under consideration. Sometimes the positive is not regarded as a degree of comparison. There are two ways of expressing these degrees. 1. By an inflection or change of the word; as, *hard, harder, hardest; happy, happier, happiest.* This mode prevails almost exclusively in Greek and Latin. 2. By an additional word; as, *more happy, most happy.* This may be called logical comparison; the other, grammatical. In French, with the exception of a few irregular adjectives, all adjectives follow the logical method. In English the logical method is generally preferred when the grammatical would produce a word difficult or harsh in the pronunciation. This is generally the case in English when the simple adjective is of more than one syllable, but it is not always so. Thus, *éarnester, prúdenter,* would make harsh combinations; not so *políter, discréeter, háppier.* The difference is, that in *éarnester, prúdenter,* the accent being on the first syllable, two unaccented syllables of discordant character are thrown together; in *políter, discréeter,* the unaccented syllables are separated; and in *háppier,* though they come together, they readily coalesce. Thus, the laws of euphony determine this point, as they do much else in language. Carlyle and Ruskin use many comparative and superlative forms that are not generally recognized. In general, it is only adjectives of quality that admit of comparison; and even adjectives of quality cannot be compared when the quality does not admit of degrees; as, a circular space, a gold ring, a universal wish. Adverbs (q.v.) in English are compared exactly like adjectives, logical comparison predominating.

COM'PASS (OF., Fr. *compas*, compass, from ML. *compassus*, circle, from Lat. *com-*, together, *passus*, step, from *pandere*, to spread out). The mariner's compass is the most important instrument used in the navigation of a ship. Compasses are of two kinds, magnetic and gyroscopic, the latter being a development of the past few years.

THE MAGNETIC COMPASS

The action of the magnetic compass depends upon the attraction of the earth's magnetic force. The earth is a great magnet, with one pole in the neighborhood of 70° N. lat. and 97° W. long., and the other in about 73° S. lat. and 155° E. long. These poles are not points, but merely centres of magnetic areas which are constantly but slowly changing their positions. Over these polar areas a freely suspended mag-

net, balanced about its centre, hangs vertically. As we recede from the magnetic poles, the inclination (or *dip*) of the magnet decreases until, on the magnetic equator (which is nowhere more than 15° from the geographical equator), it is zero. While changing its inclination (q.v.), the magnet continues to point in the general direction of the magnetic pole. This property of a magnet is used in the construction of the mariner's compass, which is merely a magnet or bundle of magnets constrained to move in a horizontal plane about a vertical axis.

When installed on board a vessel, the compass is acted upon by the magnetism of the earth and of the ship. The vertical component of the earth's force produces the *dip*, or *inclination*, of a freely suspended magnet. The ship's force may increase or decrease this, but the ordinary mariner is concerned chiefly with the angle between the compass and the geographical meridian. This angle in naval science is called the *compass error* and is made up of the *variation* (or declination), which is the angle between the geographical and magnetic meridians at the particular locality, and the *deviation*, which is the result of the ship's magnetic force. See INCLINATION; MAGNETIC MERIDIAN.

The *variation*, or *declination* (q.v.), is due to the fact that the lines of magnetic force which affect the needle are exactly parallel to the geographical meridian in only a few places on the earth. The horizontal projection of the line of force at any point of the earth's surface is the direction of the magnetic meridian of that point, i.e., the direction pointed out by the compass needle. The angle between the magnetic and geographical meridians is the variation. The variation is constantly changing from year to year for all parts of the earth, but over some areas the change is, at times, so slow that it is practically *nil*. The increase or decrease continues until a certain maximum or minimum is reached and then reverses its character. In very few parts of the world does it reach 10′ per annum. The variation is also subject to slight monthly (or seasonal), daily, and irregular changes. The monthly change is chiefly shown in an increase or decrease of the daily change. The daily change consists of a movement towards the east for part of the day and a movement towards the west during the remainder. It is greatest near the magnetic poles and least near the magnetic equator. In the temperate regions it rarely exceeds 10′ to 15° range on any one day. Irregular changes of variation of several degrees in amount, may occur during severe magnetic storms in a few minutes of time. See DECLINATION; TERRESTIAL MAGNETISM.

Magnetic charts show the variation (declination), dip (inclination), etc. Curved lines connecting the points of equal variation are called *lines of equal variation*, or *isogonic* lines, the ones connecting points of no variation being called *agonic* lines. The lines of equal *dip* are called *isoclinic* lines, the line of no *dip* being the magnetic equator. The dip of the needle, like the variation, is constantly changing, but the changes are small and do not affect the compass as an instrument of navigation. See ISOGONIC; ISOCLINIC and ISODYNAMIC.

The *deviation* of the compass is produced, as has already been stated, by the action of the magnetism of the ship in which the compass is mounted. In wooden ships the small amount of iron causes correspondingly small deviations. On a nonmagnetic ship, like the specially built vessel, the *Carnegie*, there are no deviations. But iron and steel hulls produce important deviations even in well-placed compasses and excessive deviations in those badly located; it is indeed possible to so place a compass that it will point to a particular part of the ship no matter what her heading be. In mounting compasses due regard must therefore be paid to the magnetic forces of the ship as well as to the convenience of the navigator and helmsman. Standard compasses are usually placed where they are fairly accessible, but as far removed from the ship's centre of magnetic force as possible. A steering compass is necessarily placed where the helmsman can see it constantly. Its deviation is checked by comparison with the standard.

The deviation of a compass varies as the ship changes her course. A portion of the hull is permanently magnetized and acts as a permanent magnet; the rest is in a variable state of magnetization depending upon the direction in which the ship heads and upon the magnetic latitude. As it is important, in order to steer a correct course, that the deviations upon all headings should be known, they are determined by *swinging ship*. This is accomplished by successively pointing the ship in the various directions (usually every 15° to 30°) and comparing the true bearing (ascertained from tables and computation) of the sun with the magnetic bearing. This gives the *error* on each heading. Applying the *variation* to the results gives the corresponding deviations on each point upon which observations were taken. A table of these deviations is a necessary adjunct to every compass. When the deviations are considerable, as is almost invariably the case on a modern ship, it is customary to reduce them by means of correctors. The character and extent of the correction, or *compensation* (as it is commonly called), may be obtained by magnetic observations on board the ship and on shore; from these follow elaborate computations to determine the placing of the correctors. This method involves a competent knowledge of the whole theory of the magnetization of ships; moreover, it involves much labor and consumes much time. A simpler one is called the rectangular method of compensation. The deviation is determined upon adjacent cardinal points such as (magnetic) north and east. The ship is headed on north and kept on that heading by means of another compass and a single magnet, or several small ones, placed in a fore-and-aft direction in holes in a wooden block or on a tray, below the compass to be corrected. By varying the number of magnets, or by raising or lowering the tray by means of a screw, the deviation is reduced to zero and the compass made to point to magnetic north. The same process is repeated when the ship is headed east, but the magnets are placed athwartship. Next the ship is headed northeast (magnetic), and the soft-iron spherical correctors moved in or out until the needle points correctly. The operation is then complete, unless a Flinders bar is used; this consists of a soft-iron vertical bar, used to counteract the induced magnetism in soft vertical iron, and placed forward or abaft the compass as found necessary. The ship must then be swung for *residuals*, i.e., headed in directions 15° to 30° apart, and the small remaining deviations as-

certained. These may be reduced by recorrecting, but are usually too small to render that necessary: but the usual table showing them is made out for use in laying the ship's course. In addition to the deviation caused by the ship's forces when on an even keel, a further deviation is caused by rolling or inclination to one side or the other. This is corrected by a vertical magnet below the axis of the compass and at such a distance as will correct the deviation due to the heel or roll.

The theory of the correction is that the magnets (and soft-iron correctors, which are temporary magnets) are placed in a manner to offer magnetic attraction exactly opposite to that of the forces of the ship, leaving the earth's force alone to act. Unfortunately the combination of the forces of magnets and the ship does not produce magnetic zero, but forms a magnetic field which decreases the effect of the earth's magnetic field; so that when the ship's force is so great as to need powerful correctors at the compass, the latter will be *sluggish*, i.e., have poor directive force.

The magnetic compass as mounted on board ship consists of a framework supporting the needles, the top of which is called the *compass card*. Around its outer edge the degrees are marked. In all except new-type compasses the degrees are marked from 0 to 90 on each side of the north and south points. In recent compasses the degrees are marked from 0 to 360 in the same direction as the hands of a clock move. In addition to the degrees the compass is marked in *points* (11¼°), half points, and quarter points. North, east, south, and west are called the *cardinal* points; northeast, southeast, southwest, and northwest are called the *intercardinal*. Halfway between north and northeast is north-northeast; between northeast and east is east-northeast; and so on. The other points are named north by east, northeast by north, northeast by east, east by north, east by south, etc. A full list of points in proper order is given in the subjoined table. The reciting of the points of the compass in proper order is called *boxing* the compass, and the ability to do so correctly is one of the requirements of a seaman. The present practice in the navy and to some extent in the merchant service is to give all courses and bearings in degrees when accuracy is desired and in points when an approximation only is needed. Thus 135° is exactly southwest; but if a bearing were approximately southwest, then the term "southwest" would be used.

The magnets, several in number, are secured to the underside of the card framework. The compass is mounted in the compass *bowl* and is supported on a pivot beneath its centre. In "liquid" compasses the framework is hollow and floats in a nonfreezing mixture of alcohol and water to reduce the weight on the pivot and to steady its motions. The "dry" compass is made as light as possible, but its whole weight rests on the pivot. The compass card shown is of the common navy type and differs from the latest pattern only in the marking of the degrees, which are marked each way from north and south instead of from 0 to 360. The compass bowl (which has an air-tight glass cover) is mounted in gimbals (so as to swing freely) in the top of a standard called the binnacle (q.v.), which contains the magnets used for compensation and carries arms to support the spherical correctors.

For the purpose of taking bearings (i.e., ascertaining the compass direction of an object), an *alidade* or *azimuth circle* is used. The former is a simple pair of sight vanes turning about a vertical axis on the binnacle cover over the compass or on the dumb compass on a standard (called a "pelorus") at the ends of the bridge. An azimuth circle is a circular metallic ring fitting over the top of the compass bowl on which it turns freely. On opposite sides it has a sighting vane and reflecting mirrors, so that the point of the compass card immediately beneath it can be seen at the same time that the observer sights at a distant ob-

COMPASS CARD.

ject. A *dumb* compass is a simple card or metallic plate, with graduations and marks like those on a regular compass card. It may be permanently secured to a part of the ship or mounted on pivot. See illustration in article BINNACLE.

History. The early history of the magnetic compass is involved in more or less obscurity. In a rough form it is said to have been known to the Chinese 2000 years before the Christian era, though this is more than doubtful. But the policy of the Chinese rulers and the habits of the people conspired to make the Chinese indifferent and unenterprising navigators, so that even if a knowledge of the directive property of a magnet were known to them it is not likely that they made much use of it. The earliest definite reference to it is in a work by Alexander Neckam, entitled *De Utensilibus* and written in the twelfth century. He refers to it as a needle on a pivot which, when allowed to come to rest, shows the navigator the direction in which to steer. In another work, *De Naturis Rerum* (lib. ii, c. 89), he writes as follows: "Mariners at sea, when, through cloudy weather in the day, which hides the sun, or through the darkness of the night, they lose the knowledge of the quarter of the world to which they are sailing, touch a needle with a magnet, which will turn round till, on its motion ceasing, its point will be directed toward the north" (Chappell, *Nature*, No. 346, June 15, 1876). Subsequent to this there are repeated references to the use of a magnetic needle for navigating purposes. As early as the thirteenth century it seems to have been known to the navigators of all European nations. In 1248 Hugo de Bercy speaks of an improved form in which it is supported on two floats in a glass cup, while as early as 1269 its variation from true north is said to have been noted. The division of the compass card into 32 points is a natural one and was in use in 1391, when it is mentioned by Chaucer.

THE GYRO COMPASS

Until quite recently all navigating compasses were of the magnetic type, and in the mercantile marine these are still used almost exclusively. But in naval vessels, particularly in heavily armored ships and submarines, the strong magnetic forces in surrounding structures prevent the placing of magnetic compasses in the most desirable positions, especially as many of these structures (such as turrets, guns, observation towers) are being frequently moved so that the strength and direction of their magnetic forces are changed in a manner to preclude compensation or correction. Other means have therefore been sought for directing the course of war ships, the most promising of which seemed to be the gyro compass, but it was not until about 1910 that this instrument became sufficiently developed as to reliability and convenience. It is installed on all battle ships and submarines in the United States navy, and, while not yet perfectly satisfactory, it is of the greatest utility and is being steadily improved. The principal troubles have been due to lack of sturdiness of construction, and this will be corrected. If, in addition, the master gyro mechanism be installed in duplicate or triplicate, all compass difficulties will probably be solved and the magnetic compass, except as a possible reserve, dispensed with as far as large naval vessels are concerned.

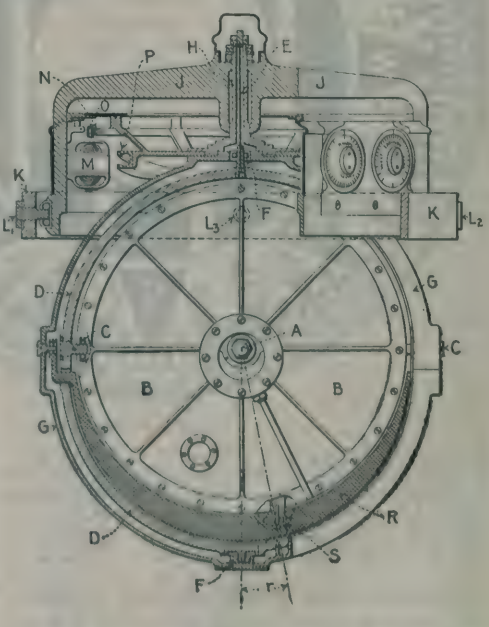
The construction of the gyro compass is founded upon the fundamental phenomena of rotation, inertia, and precession. The underlying principles may be stated in three laws as follows:

1. A spinning mass may be moved in any direction without the slightest resistance, response, or reaction, so long as the path of movement is a straight line; but if the path be other than straight, new phenomena at once manifest themselves in the form of automatic motion, provided the mass is free to move in directions other than that of its spin.

2. When a spinning mass receives a force which tends to change its plane of rotation, it not only resists such force, but the mass will manifest motion at a different angle from the impressed force and seemingly unrelated to it. This motion is known as precession, and its explanation follows directly the application of Newton's first law.

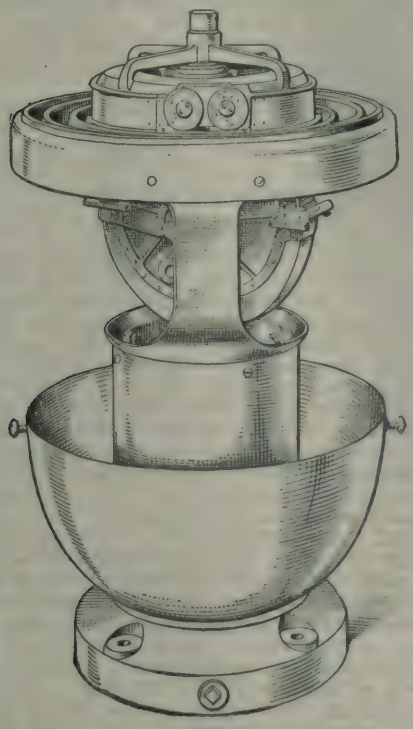
3. Any revolving mass, such as a spinning wheel, tends to swing so as to bring its axis of rotation parallel to the axis of any externally applied force tending to make it move in a closed regular curve (such as a circle) and in such relation that the direction of rotation is the same as the direction of the applied force. From this we see that the axis of a freely suspended gyro wheel will tend to turn parallel to the earth's axis of rotation, so that its spin will be in the same direction as that of the earth.

In the United States the best-known gyroscopic compass is made by the Sperry Gyroscope Company of New York. The accompanying illustrations show the parts of this compass.

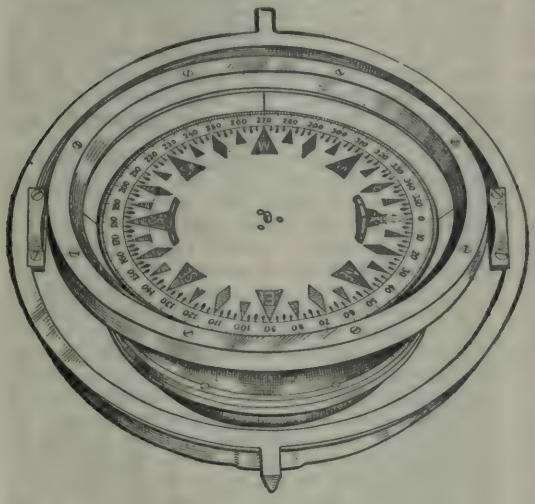


Inside the casing *B* (above) the gyroscope wheel rotates on a horizontal shaft. The casing is pivoted on a horizontal axis *C* through its centre of gravity and is carried by the frame *D*. This frame is suspended from the upper end of the vertical extension of the "phantom"

ring G by means of the torsionless wire E. By means of the bearings L_1, L_2, L_3, and L_4, and the ring K the frame J is mounted in Cardan suspension. The ring D, together with the wheel



casing, is called the *element*. On the ring D are electrical roller contacts which form connection with corresponding contacts, the latter being on the phantom. These connections control the follow-up motor M, which is carried on the frame J and which by means of the



gearing N moves the phantom in azimuth to correspond to any movement of D.

The phantom carries the compass card O, and on it is the cam P, a part of the automatic correction device, which mechanically solves the corrections necessary to be applied to the compass to allow for the course of the ship, the speed on that course, and the latitude. The bail R is supported by the phantom ring. It is attached to the gyro casing at S and is connected in such a position that it is eccentric to both the vertical and horizontal axes of the gyro. By this means oscillations of the gyro are lessened or prevented. This also produces positive orientation.

The gyro wheel revolves in a vacuum inside the casing at approximately 8500 revolutions per minute. This speed is obtained by means of an alternating current motor without commutator. At this speed the compass has a directive power of approximately 200,000 *dyne cms.*

The readings of this master compass, which is situated in the most convenient and best-protected part of the ship below decks, are transmitted to repeating compasses by means of a transmitter, which is operated by the master and forms part of its mechanism. The repeating compasses are placed wherever desired—in the conning tower, on the steering platform, bridges, etc. The transmitter controls the poles of a small motor in each repeater compass in such a manner that the armature of this motor is turned by steps to follow the dial of the master compass when it moves. In order to obtain the same reading on the repeaters as on the master, a synchronizer forms part of the installation, and by means of it all the repeaters may be set to the same reading as the master.

Messrs. Martienssen and Anschütz-Kaempfe have invented a gyroscope compass which is floated in mercury. As this compass has but two degrees of freedom and is consequently affected beyond this by the heeling or pitching of the ship, it is said to give results not so satisfactory as those of the Sperry type. Other types of gyro compasses are in use or undergoing experimental investigation.

Bibliography. Consult: *The Admiralty Manual for the Deviations of the Compass*, by Capt. F. J. Evans, R.N., F.R.S., and Archibald Smith, M.A., F.R.S. (new editions appear from time to time); *Naval Professional Papers* (U. S. Navy), No. 22 (Washington, 1886); Cornwell, *Compass Disturbances in Iron Ships* (1887); Bowditch, *The American Practical Navigator* (Washington—new editions at short intervals); Lyons, *Treatise on Electromagnetic Phenomena and the Compass and its Deviations Aboard Ship* (New York, 1901–03); Smith, *Practical Compass Adjustment* (Seattle, 1903); Diehl, *Deviations of the Compass, Practical Problems* (Washington, 1902); publications of the Superintendent of Compasses, United States Navy. For gyro compasses, see article on "Engineering Applications of the Gyroscope," in *Journal of the Franklin Institute* (May, 1913).

COMPASS, Solar. An instrument for determining at any place an accurate north and south line. It has a latitude range of about 35° and may be adjusted to the latitude of any place in the United States. It has a latitude arc, a declination arc, and an hour arc, each to be duly adjusted for an observation, and has been found of much service in running important boundary lines and other government surveys. One of its recommendations is its avoidance of the perplexities caused by local attraction. It is the invention of William A.

Burt, of Michigan. For illustration, see Plate of ENGINEERING INSTRUMENTS.

COMPASSES. A mathematical instrument for transferring or marking off distances (and for this purpose often called "dividers") or for drawing circles. The common compasses, or dividers, are composed of two rods or legs joined together by a pivot joint at one end and pointed at the other; when adapted to drawing arcs, the lower part of one of the legs admits of receiving a pen or pencil.

Beam compasses consist of points sliding on a bar, to which they may be clamped at any distance from each other. They are used for lengths greater than the pivot compasses can expand, and when delicately made can be used for more accurate dividing. See GRADUATION.

Proportional compasses have a point at each end of each leg, and the pivot between, thus forming a double pair of compasses opposite to each other. If the pivot is midway between the ends, the opening of each pair of points will be equal. If its distance from one pair of points be double that from the other, the openings will be as two is to one, and so on for any ratio. To adapt them for variable proportions, the pivot is made a clamping screw, which moves in an elongated slot in the legs and may be fixed at any point.

Triangular compasses have three legs, so that the vertices of a triangle may all be transferred at once.

Bullet or *club compasses* have a ball in place of one point, adapted to turning in a hole. See also CALIPERS; ELLIPSE (ellipsograph, or oval compasses).

COMPASS PLANT (*Silphium laciniatum*). A large plant, called also "resin weed," because it abounds in resinous matter. It grows on the prairies, and the edges of its stem leaves are said always to point directly, or nearly, north or south. When cultivated in gardens or growing in shade, this property does not always appear. The same phenomenon is exhibited by the stem leaves of prickly lettuce (*Lactuca scariola*). In this plant the leaves are usually considered as vertical, but this is brought about by a twist near their bases. The peculiar arrangement of the leaves of these plants is due to their adaptation to light. Both surfaces of the leaves are equally sensitive to light, and only by presenting their edges vertically and their tips to the north and south are they able to secure equal illumination to both sides of the leaves.

COMPENSATION. In English and American law, pecuniary reparation for loss sustained or for injuries suffered. The usual measure of damages in actions at law, whether based on tort, or wrong, or on breach of contract. (See DAMAGES.) In the civil-law systems of the continents and of Latin America, and in Scots law, a counterclaim or set-off. The principle applied is that, where two parties are mutually indebted, their debts shall extinguish each other if equal, and, if unequal, leave only a balance due. In order to avail one's self of the principle of compensation, the set-off or counterclaim must be pleaded, as it does not operate ipso jure; but, when pleaded, it is held to operate from the period when mutual claims existed, the interest on either side being stopped from that time.

Compensatio injuriarum is a defense against actions of damages for slander or the like. It is not a bar to an action, but a set-off or counterclaim. In the common-law system of England and the United States it is not permissible to set off one trespass or other wrong against another, but each injury must be compensated by a separate action; and in Scotland the leaning recently has been in the same direction. See CONTRACT; TORT; and consult the authorities there referred to.

COM'PENSA'TION (Lat. *compensatio*, equalization, from *compensare*, to equalize, from *com-*, together + *pensare*, to weigh, frequentative of *pendere*, to weigh). A term used in physical experiments to describe methods where sources of error or other conditions are neutralized by the introduction of factors which act in an opposite direction by an equal amount, and compensate for the original error. For example, a flint-glass convex lens, in addition to refracting rays of light, also separates them into their spectral colors. This can be compensated by combining with the convex lens a concave lens of crown glass which has less refraction but greater dispersive power. Such a lens, being opposite in its effect to the first lens, will unite the rays, but does not destroy the deviation. (See ACHROMATISM.) In the case of the pendulum (q.v.), an increase in temperature causes it to lengthen, and consequently oscillate more slowly. Compensation is here effected by raising its centre of oscillation with any increase in length due to a rise in temperature and thus keeping constant the distance between its point of support and its centre of oscillation. In a chronometer the balance wheel is compensated by constructing its rim of two metals with different coefficients of expansion. An increase in temperature tending to expand the wheel is compensated by the rim being brought nearer the centre, it being curved inward by the uneven expansion of the metals. See WATCH, for further description and illustration of a compensating balance wheel.

COM'PETENCE, or COM'PETENCY. As a law term, used in the sense both of authority and of legal ability. It is in the former sense that it is employed in the law of France and of other Latin countries as the equivalent of our term "jurisdiction," the competence of a tribunal being its authority or jurisdiction over a given person or proceeding.

In English and American law the word is specifically used to denote the legal fitness or eligibility of a witness to be heard, or of a judge or juror to participate in the trial of a cause. Competency, in the legal sense of the term, does not refer to mental or physical ability, but to purely legal grounds of qualification —as that a judge or juror shall not be personally interested in the issue to be tried; that a witness shall not be so related to the transaction on which the suit is based as to be incapacitated by law from giving evidence thereof. Such facts as the credibility of a witness, the relevancy of his testimony, or even his actual knowledge of the transaction in question, have no bearing upon the question of his competency. He may be competent to participate as a witness and may yet be utterly untrustworthy or ignorant of the facts involved in the issue. So, not having been an actual, percipient witness of the facts to which he is called upon to testify, he may have his testimony excluded as mere hearsay, without thereby having his

legal competency questioned. In that case it is not the witness, but the evidence offered by him, that is "incompetent." Competency, whether of judge or juror or witness, is always presumed until it is impeached and the contrary shown. The question is one for the court, which may inquire into the facts for the purpose of arriving at a judgment upon it. The law as to the competency of witnesses will be considered under the title WITNESS. See also EVIDENCE: JUDGE; JURY; and the authorities there referred to.

COM'PETI'TION. In the broadest sense of the term, rivalry for a common object, such as the means of livelihood, a position of supremacy, a unique honor. Competition in this sense is coextensive with life; most of the acts grouped under the rubric "the struggle for existence" are competitive. Competition may arise between groups or between individuals. Group competition may be illustrated by the struggle between evergreen and deciduous trees for the soil of certain mountain slopes, between cattle and sheep for grazing grounds, between states or nations for territory or power. Of the last, familiar examples are the competition of Dutch and Portuguese for the control of the Indies, of the French and English for the control of the Mississippi valley, of Athens and Sparta for Hellenic hegemony. The Kansas-Nebraska struggle was a competition between the supporters of slavery and its enemies. Racial competition is manifest in the conflict between Germans and Poles for the possession of the land in certain Polish provinces.

The term "competition" is often employed, by way of analogy, to describe mere rivalries of technique. Thus there is said to be competition between the Bessemer and the open-hearth methods of steel manufacture, between electricity and steam as motive power, between the telegraph and the long-distance telephone. Often such competition is underlain by competition between individuals or groups, but this is not necessarily the case.

In political economy "competition" is confined to rivalry in supplying an economic demand, or the acquisition of an economic good or service. It is thus twofold, seller's competition and buyer's competition. The former exists when more than one seller offer the same commodity, or commodities meeting the same need. Thus competition exists, not only between those who offer beef for sale, but also between the latter and those who offer any satisfactory substitute for beef. Competition is, however, limited in its effectiveness where the products offered by rivals are not practically identical technically.

Competition in the economic sense of the term is especially characteristic of the modern epoch. While competition between merchants engaged in foreign trade antedates written history, the competition between retail dealers and between producers was closely regulated, by custom or mutual agreements, or occasionally by law, until a comparatively recent period. With the expansion of trade after the great discoveries in the fifteenth and sixteenth centuries, the structure of customary and regulated prices in western Europe began gradually to disintegrate. The process of disintegration was hastened by the formation of national states and the loss of control by the cities over local prices. The wages of labor were slow to respond to the influence of competition until the application of capital to industry broke down the earlier handicraft system. From the Industrial Revolution (q.v.) the progress of competition has been rapid. In the field of wholesale prices its sway is complete, and the same thing is true of prices of capital shares dealt in on the exchanges. In retail trade competition is subject to a greater or less limitation through custom, the ignorance or indifference of the buyer, or through agreements among dealers. In the supplying of agricultural products competition operates practically without restraint; and the same thing is true of a great variety of manufactures. In other parts of the manufacturing field competition is regulated by agreements between producers, or in some cases by a unification of a majority of the industry under a common control. Ocean transportation is essentially competitive; land transportation is largely subject to regulation by private agreement or by public authority. In the capital market competition is the prevalent regulator. In the labor market competition is subject to restraint, universally through the half-conscious solidarity of labor, and in part of the field, through labor organizations or through public regulations. Furthermore, there are a number of fields in which the earlier ideals of fair price act to restrain competition. Thus physicians' fees are rarely determined by direct competition, but rest partly upon mutual agreement, partly upon custom, and partly upon a sense of inherent justice. Such vestigial instances of an earlier economic order are, however, of minor importance, as compared with the conscious restrictions upon competition imposed by trades unions, combinations of employers, and state action.

Even where competition is restrained, its influence is powerful. The trade-union cannot often raise wages much above the level prevailing in industries where competition is active in determining the wages contract. The most powerful capitalistic organizations are limited in their price policy by the possibility that new competitors will spring up. Such possible competition, known in political economy as "potential competition," often escapes popular notice; it is none the less perhaps the most powerful regulator of the prices fixed by trusts and other semimonopolistic enterprises. Where the price of a commodity or a service is stereotyped by custom, as in the case cited above of physician's fees, competition takes the form of a multiplication of those providing the service, and hence regulates average incomes, if not prices. When the income is fixed by law, as in many public services, competition determines the personal quality of the candidates chosen. When railways operate under agreements as to fares, competition appears in the quality of service provided.

In view of the development of monopolistic combinations in recent decades, it is often asserted that the era of competition is already past. This opinion is not commonly shared by the economic historian, who finds far less competition in earlier periods than is popularly believed to have been prevalent, and who finds in the present institutions competition everywhere, often disguised under its various protean forms. From the view point of economic history, the present economic system is un-

doubtedly best described as one of competition, tempered everywhere by elements of monopoly.

In pure economic theory the concept of competition is employed as a premise in the construction of logical systems of economics. There is no attempt to demonstrate the existence of unrestrained competition; in fact, such an attempt would be foreign to the spirit of pure economics. What is sought is a convenient clue to the baffling problems of price and the distribution of income; and this clue has commonly been found in competition. Assuming perfect competition, what prices and incomes would continue to exist? The results of such an analysis are unreal, but they throw light upon the tendencies of an economic system in which competition is widely prevalent, as the present. By successive approximations, allowing for friction and monopoly, the theoretical structure is made to conform more nearly to reality. Among superficial critics of economics the view is current that this employment of competition as a logical premise is tantamount to the erection of competition into an ideal, a proper object of economic policy. As a matter of fact, there is no unanimity among economists who employ this method as to the social utility of competition.

Competition was indeed regarded as an ideal by the early economists, both French and British. The hampering effects of public regulation of industry in the eighteenth century produced a powerful reaction in the minds of such profound students as Quesnay, Turgot, and Adam Smith. These writers would have supported the practical elimination of all state interference in industry as well as the suppression of all combinations to restrain free competition. The argument for such extension of the sway of competition was a plausible one. If subject to no restraint, each capitalist would place his capital where it would yield the highest returns, each laborer would seek the point where he would receive the highest wages. The highest profits and the highest wages, however, could be paid only by such industries and under such methods as would yield the largest amount of valuable products. Thus the free play of self-interest, under competition, would yield a maximum of production in society. The more capable producers would underbid the less capable in the sale of goods, and hence the productive powers of society would be concentrated in the most efficient hands. Under active competition prices could not rise above costs to the most numerous class of producers; exceptional rewards could be gained only by those who succeeded in introducing new methods; and sooner or later these methods would become general, fixing a new and lower level of costs. Among workingmen, if competition leveled down the wages of the privileged minority, it would level up the wages of the unprivileged majority; and all workers would share in the benefits of the abundance and cheapness of commodities produced by an efficient system.

In a century of experience with the competitive system it has become clear that while much of the good that the system was expected to develop has actually been realized, many evils also have arisen out of it. The supplanting of inferior methods by superior ones has been accompanied by untold hardship to the laborers employed under the former methods. Again, in the matter of the labor contract, competition has often been only one-sided, laborers competing for jobs, with no effective competition of employers for men. Under such a system the interests of labor have naturally suffered. In many cases competition has not expelled the inferior employer from the field, but has forced him to cut wages and drive his working force all the more ruthlessly. In the market for commodities competition has often had the effect of stimulating the progress of adulteration rather than that of improvement. Perhaps the heaviest indictment against the system of free competition has been the development of cutthroat methods; such, e.g., as underselling an efficient but poor competitor until he is driven from the field, and then recovering the cost of the competitive struggle through monopoly prices. Competition of this character, it is generally recognized, leads inevitably to monopoly and should be restrained in the interest of the competitive system itself. There are, further, certain businesses, such as railway transportation, in which competition produces endless discriminations among patrons. Those who are so powerful that their business is worth striving for, and those who have established themselves at strategic points where several routes compete, are favored at the expense of those who are poorer or less favorably situated. Railway competition, it is widely believed, is more injurious to society than railway monopoly.

Competition, finally, entails heavy burdens upon society through the excessive duplication of plant, the distribution among many of the services that could be performed by one, through advertising calculated, not to create a demand for a commodity, but to attract customers away from competitors who would otherwise supply them.

In view of the recognized defects of the competitive system it is not surprising that few economists hold to the doctrine of the sufficiency of competition as a regulator of economic life. In many instances competition itself needs to be regulated, either by mutual agreement or by law; in other instances, especially in matters pertaining to the wages contract, the force of competition needs to be supplemented by positive social regulations. In a part of the economic field—the natural monopolies—it would be desirable to abolish competition altogether.

Literature. The subject of competition is treated, more or less incidentally, in almost all authoritative treatises on political economy (q.v., for bibliography). There is no important work treating of competition in all its aspects. For the inadequacy of competition as a regulator of wages, consult Webb, *Industrial Democracy*, part iii (new ed., London, 1902). For the illegitimate forms of competition now prevalent, consult Eddy, *The New Competition* (New York, 1912). See MONOPOLY; TRUSTS; RAILWAYS; TRADE-UNIONS; POLITICAL ECONOMY.

COMPIÈGNE, kôN'pyâ'ny' (Lat. *Compendium*). A town in the Department of Oise, France, on the river Oise, a little below its junction with the Aisne, and 33 miles east-southeast of Beauvais (Map: France, N., H 3). The town is picturesque and has a remarkable Gothic hôtel de ville, with museum and library, and a magnificent palace built by Louis XV.

It contains a library, a picture gallery, and a museum of Cambodean antiquities. The park is extensive, and adjoining the gardens is the beautiful forest of Compiègne, extending over about 30,000 acres, which in the past has served as a royal hunting ground. The industries of the place are rope making, boat building, manufacture of hosiery, sweetmeats, pipe, chemicals, and hats. There is considerable trade in wool, grain, and cattle. Pop. (commune), 1901, 16,503; 1911, 17,046. Compiègne is mentioned in the times of Clovis under the name of *Compendium*. It was at the siege of this town, in 1430, that Jeanne d'Arc, the Maid of Orléans, was captured; Louis XIII signed treaties with Sweden and Holland here in the seventeenth century; in 1810 Napoleon and Maria Louisa of Austria first met here, on the occasion of their marriage. See De Bicquilley, *Quelques recherches historiques sur les origines de Compiègne* (1875).

COM'PITA'LIA, or LUDI COMPITALICII (Lat., Compitalian games, from *compita*, crossroads). An annual festival in Rome, held between December 17 and January 5, in honor of the *Lares Compitales*, the divinities presiding over places where two or more roads meet, in country or in city. Even slaves had a part in the festival, which seems later to have included public games. Macrobius has a strange story, that Tarquinius Superbus restored the festival, which had been neglected, and sacrificed boys as a part of the services. Human sacrifices, he continued, did not survive the Tarquins, for after their expulsion garlic and poppies were offered. Consult Fowler, *Roman Festivals of the Period of the Republic* (London, 1899), and Wissowa, *Religion und Kultus der Römer* (2d ed., Munich, 1912).

COMPLAINT. At the common law, a formal accusation of a crime preferred before a magistrate or other public authority charged with the duty of making inquiry into its commission. The charge must be specific, and the complaint must state the facts constituting the crime as well as those upon which the complainant relies to establish its commission. The term is also employed in England to denote the accusation laid before a justice of the peace or courts exercising a summary jurisdiction in cases where proceedings are commenced on information and not by indictment.

In the system of code pleading, which has in many of the United States superseded the system of common-law pleading, the first pleading in a civil action, corresponding to the declaration at common law and to the bill in equity, is known as the "complaint." It is thus defined by the New York Code of Civil Procedure (sec. 481): "A plain and concise statement of the facts constituting each cause of action without unnecessary repetition." See INFORMATION; DECLARATION; BILL; PLEADING.

COMPLAINT', THE. A collection of poems in blank verse, by Edward Young (1742), better known under their secondary title, *Night Thoughts*. They were written after the death of his stepdaughter and her husband, who are referred to under the names of Narcissa and Philander.

COMPLAINT OF MARS AND VENUS, THE. A poem by Chaucer, written about 1380, containing an introduction and two separate poems, "The Complaint of Mars" and "The Complaint of Venus." At the conclusion the author says it was taken from the French of "Graunson."

COMPLAINT OF PITY, THE. "How Pitie is dead and buried in a gentle Herte," a poem by Chaucer (1367).

COMPLEAT ANGLER, THE. A famous work on angling, by Isaak Walton (1653). It is written in a pleasing style; parts being in the form of conversations between Piscator, Venator, and Viator—a fisherman, a huntsman, and a pedestrian—interspersed with a few quaint old songs. See ANGLING.

COMPLEMENT (Lat. *complementum*, that which fills up, from *complere*, to fill up, from *com-*, together + *plere*, to fill; connected with Gk. *πιμπλάναι*, *pimplanai*, Skt. *pūr*, *par*, to fill, Lith. *pilnas*, OChurch Slav. *plŭnŭ*, OIr. *lōn*, full, Goth. *fulls*, OHG. *fol*, *foll*, Ger. *voll*, AS., Eng. *full*). In mathematics, that which completes a given magnitude or increases it to the value of a fixed magnitude. In angular measure it signifies the angle which, added to a given angle, produces 90°; e.g., 30° is the complement of 60°, 1° is the complement of 89°, 45° is the complement of 45°, 100° is the complement of −10°, and 0° is the complement of 90°. Such pairs are called complementary angles. The arithmetic complement of an integer is the difference between the integer and the next higher power of 10; e.g., 40 is the arithmetic complement of 60, 1 is the arithmetic complement of 99, 375 of 625, and 7 of 3. The complement logarithm, or "cologarithm," of a number, is the logarithm of the reciprocal of the number, or 10 less than the complement of the logarithm (of the given number). See LOGARITHM.

If through any point on the diagonal of a parallelogram lines are drawn parallel to the sides, four parallelograms are formed. The two of these that are not bisected by the given diagonal are called complements of the given parallelogram.

COM'PLEMENT. In nautical language, all persons designed to be on board a ship for the purposes of navigating or fighting her, or to enable her to carry on the service for which she is intended. The complement includes the officers and crew; but the latter terms apply to the persons actually on board, while the former applies to all who *should* be on board if there are no vacancies.

COM'PLEMEN'TARY COLORS. Colors which, when combined, produce white light. Examples of pairs of such colors are given in the following table:

Red	Green-blue
Orange	Cyan blue
Yellow	Ultramarine-blue
Greenish yellow	Violet
Green	Purple

These colors may be observed readily with a simple polariscope, where polarized light from a Nicol's prism (q.v.) falls upon a prism of calc-spar and glass, in which, by virtue of the doubly refracting power of the calc-spar (see LIGHT, *Double Refraction*), there is furnished a double image of the aperture through which the polarized light from the Nicol passes. If a strip of selenite be interposed between the polarizing prism and the crystal, the two images referred to will be different in color, one shade being complementary to the other. These strips of selenite may be of various thicknesses and

will thus produce various colors. This follows from the well-known principle that, when plane-polarized light is transmitted through a thin plate of a doubly refracting medium, the ordinary and extraordinary rays when examined with a doubly refracting analyzer will give images brightly colored, which where they overlap are white, showing that the two colors are complementary. If two complementary colors are combined—and it must be remembered that the colors themselves, not the pigments, are here meant—then white light is produced. This can be accomplished best, perhaps, with the Maxwell color disk where a disk of cardboard composed of segments of complementary colors is rapidly rotated. The impressions of the two colors follow each other so rapidly that the sensations are blended, and if the colors are used in the right proportions we have a gray tint produced, as the luminosity of the two colors either singly or jointly is not so great as that of a white surface with which it would be compared. Complementary colors vary with the light by which they are viewed and are different when seen by artificial illumination from what they are in the daytime. The explanation is to be found in Young's theory where the color sensation is considered to be furnished by three groups of nerves corresponding to the red, green, and violet-blue waves. If all of these nerves are stimulated together, the sensation produced is that of white light. Consequently a certain red acts on the red nerves, while its corresponding complementary color, green blue, would stimulate the other sets of nerves, and the result of all acting together would be the sensation of white light. For a thorough discussion of this subject, which may be appreciated by the general reader as well as the student of physics, consult Rood, *Modern Chromatics*, a new edition of which was published (New York, 1899) under the title of *A Text-Book of Color*. See Color and the authorities there cited; Visual Sensation.

COMPLEX'ION (OF., Fr. *complexio*, from Lat. *complexio*, combination, from *complecti*, to entwine, from *com-*, together + *plectere*, to weave). The color of the skin, existing in the epidermis and dependent upon certain pigment cells. Those persons most exposed to the weather and least under the influence of civilization are usually of the darkest color. Light hair is the usual accompaniment of white and thin skin, while dark hair and dark complexions commonly go together. There does not appear to be any anatomical difference in the skins of persons of light and dark complexions; the differences are the result of temperature, climate, and exposure. The more decided differences in skin color which may be called racial—the white of the Caucasian, the brown or olive of the Mongolian, the yellow or tawny of the Malayan, the red of the Amerind, and the black of the African and Australian—are apparently connected with deep-seated physiologic processes as well as hereditary causes; they are discussed elsewhere. See Somatology.

COMPLEX NUMBER. The steps in the growth of the number system of algebra may easily be illustrated by the roots of equations, thus:

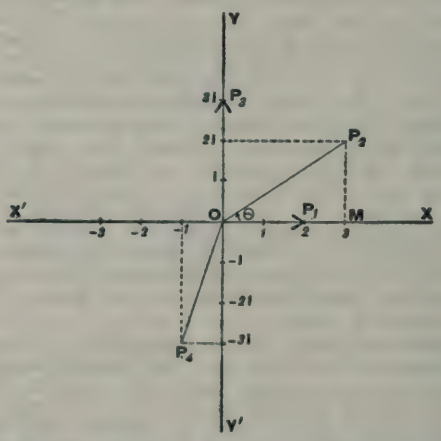
The solution of the equation $x - 3 = 0$ is 3, a positive integer which may be represented graphically on a straight line. The solution of the equation $3x - 2 = 0$ is $\frac{2}{3}$, a fraction which may also be represented graphically on a straight line. The solution of $x^2 - 2 = 0$ is $\sqrt{2}$, a surd which may be represented by the diagonal of a square whose side is 1. The solution of $x + 2 = 0$ is -2, a negative number, which may be represented on a straight line in the opposite direction from that of the positive number. But the solution of

$$x^2 + 2 = 0 \text{ is } \pm\sqrt{-2} \text{ or } \pm\sqrt{2}\cdot\sqrt{-1},$$

called an "imaginary number." The symbol $\sqrt{-1}$ is commonly called the "imaginary unit" and is represented by i. All numbers containing the factor i are called "imaginary numbers," as opposed to real numbers; e.g.,

$$\pm i, \pm 2i, \pm 3i, \ldots \pm \tfrac{2}{3}i, \pm\sqrt{2}.i$$

are imaginaries. The algebraic sum of a real number and an imaginary is called a complex number; e.g., $1 + i$, $2 - 4i$, and in general $a + bi$. A complex variable is generally expressed by $x + yi$, in which x and y are real



variables. Complex numbers are represented graphically in a plane. In the figure the real numbers are laid off on the axis XX' in the usual way, and the coefficients of i on the axis YY'. The points in the plane corresponding to these coördinates represent the complex numbers. Thus, P_1 on the axis represents the real number 2, P_2 represents the complex number $3 + 2i$, P_3 represents $3i$, and P_4 represents $-1 - 3i$. Any point and the origin uniquely determine a line segment, or vector, called the modulus of the complex number, and this may also be taken to represent the number. In the figure the moduli are OP_1, OP_2, OP_3, OP_4. In general, the modulus of a complex number $a + bi$ is the diagonal of a rectangle of sides a and b; hence its absolute value is $\sqrt{a^2 + b^2}$. Thus, the modulus of $3 + 2i$ (OP_2 in the figure) is $\sqrt{9 + 4}$ or $\sqrt{13}$. The convention as to the direction of i is a reasonable one; for since multiplying $+1$ by -1 revolves it through 180° to the position -1, therefore its multiplication by one of the two equal factors of -1, viz., $\sqrt{-1}$, may be interpreted as revolving it through 90°. There are other sufficient reasons for this convention, which will be evident to one who studies the subject. The complex number is a directed magnitude; i.e., it has both extension and direction in its plane. This is best understood by considering the number $a + bi$ in

the form $r(\cos\theta + i\sin\theta)$, in which r is the modulus $\sqrt{a^2+b^2}$, and θ is the amplitude. In the figure $\cos\theta = \frac{a}{\sqrt{a^2+b^2}}$, $\sin\theta = \frac{b}{\sqrt{a^2+b^2}}$ (See TRIGONOMETRY.) This method of representing the complex number as a directed magnitude in a plane was at one time thought to be due to Argand, and hence the figure is often called "Argand's diagram." Two complex numbers which differ only in the sign of the imaginary part are called conjugates; e.g., $2 + 3i$ and $2 - 3i$, or, in general, $a + bi$ and $a - bi$. Complex numbers are subject to the associative, commutative, and distributive laws, and, when combined by the fundamental operations of algebra, yield no number not already defined in this article. For $x + yi$ represents real numbers when $y = 0$, imaginaries when $x = 0$, and complex numbers when x, y are real and not zero. Hence $x + yi$ becomes a convenient form for representing general numbers; and instead of saying that every equation has a root, which may be real, imaginary, or complex, we may say that every equation has a root $x + yi$. If, in plotting the successive moduli of a sum, the second modulus is drawn from the end of the first, the third from the end of the second, and so on, the result is a broken line which may be closed by connecting the last point with the origin. This vector is called the sum. Since no side of a polygon is greater than the sum of the remaining sides, the modulus of the sum of any number of complex numbers is not greater than the sum of their moduli. This is expressed symbolically thus:

$$|N_n| \leqq |N_1| + |N_2| + \ldots . |N_{n-1}|$$

Multiplying the expression $r(\cos\theta + i\sin\theta)$ by $r'(\cos\theta' + i\sin\theta')$ and applying the formulas for the functions of the sum of two angles (see TRIGONOMETRY), the product is $rr'[\cos(\theta + \theta') + i\sin(\theta + \theta')]$. Hence the product of the moduli of two complex numbers is the modulus of their product, and the sum of the amplitudes is the amplitude of the product. Similarly for n complex numbers. For brevity, let $r\mathrm{cis}\theta \equiv r(\cos\theta + i\sin\theta)$, then $r_1\,\mathrm{cis}\theta_1 \cdot r_2\mathrm{cis}\theta_2 \cdot \ldots r_n\mathrm{cis}\theta_n = r_1 \cdot r_2 \ldots r_n\mathrm{cis}(\theta_1+\theta_2+\ldots\theta_n)$. This is known as De Moivre's theorem. If each of the above numbers equals the first one of them, $(r_1\mathrm{cis}\theta_1)^n = r_1{}^n\mathrm{cis}_n\theta_1$ or the nth power of the complex number. The quotient of $r_1\mathrm{cis}\theta_1$ by $r_2\mathrm{cis}\theta_2 = \frac{r_1}{r_2}\,\mathrm{cis}(\theta_1 - \theta_2)$, and $\sqrt[n]{r_1\,\mathrm{cis}\theta_1} = \sqrt[n]{r_1} \cdot \mathrm{cis}\,\frac{1}{n}\theta$.

By observing the changes in the modulus and amplitude, the results of any of these operations may be represented graphically. The variation of a function of a complex variable $x + yi$, due to the variation of x and y, is very important in the theory of equations and functions. Thus the fundamental proposition that every equation has a root is a consequence of Cauchy's theorem which asserts that the number of roots of any equation comprised within a given plane area is obtained by dividing by 2π the total variation of the amplitude of the function corresponding to the complete description, by the complex variable of the perimeter of the area.

The first appearance of the imaginary is found in the *Stereometria* of Heron of Alexandria (third century B.C.). Diophantus (supposed to have flourished in the third century A.D.) met these numbers in his algebraic work, but failed to give an explanation. Bhaskara (born 1114) recognizes the imaginary, but pronounces the roots involving $\sqrt{-1}$ to be impossible. Cardan (1545), in his *Ars Magna*, was the first mathematician who had the courage to use the square roots of negative numbers in computation. Bombelli, Girard, and Descartes (q.v.) formulated rules for the use of such quantities as $a + b\sqrt{-1}$, but founded no theory. Wallis (1685) made the first attempt to give a geometric interpretation. Euler (1770) still regarded these quantities as impossible. Thus it was reserved for Casper Wessel (1797), a Norwegian surveyor, to invent a graphic treatment of complex numbers. His method is contained in a memoir, presented to the Royal Academy of Science and Letters of Denmark, entitled *On the Analytic Representation of Direction*. For the early development of the subject, however, credit must be given to Argand, Gauss, Servois, and others, since Wessel's article (published in 1799 by the Royal Academy of Denmark) did not appear in French until 1897, 100 years after its presentation. Gauss did much to establish the underlying principles. Argand's memoir (1806), unquestionably an original and independent production, supplied the graphic theory that lay neglected in the work of Wessel. François Servois, Gergonne, and Cauchy did much to correct the errors of their predecessors and to generalize the theory of directed lines.

Complex number, being the most general type of algebraic number, has come to occupy a place of very high importance in modern analysis. It has led in recent times to the establishment of the theory of functions (q.v.) and quaternions (q.v.). Consult: Beman, "A Chapter in the History of Mathematics," in the *Proceedings of the American Association for the Advancement of Science* (Salem, 1897); Cauchy, *Cours d'analyse* (Paris, 1821); Warren, *A Treatise on the Geometric Representation of the Square Roots of Negative Quantities* (Cambridge, 1827); Chrystal, *Algebra*, part i (Edinburgh, 1889); Hankel, *Vorlesungen über die complexen Zahlen* (Leipzig, 1867); Durège, *Theorie der Functionen einer complexen veränderlichen Grösse* (ib., 1873), trans. by Fisher and Schwatt as *Elements of the Theory of Functions of a Complex Variable* (Philadelphia, 1896); Wessel's work above mentioned.

COMPLU'VIUM. See ATRIUM; IMPLUVIUM.

COMPONÉ, kŏm-pō'nā (Fr., composed), or GOBONY. In heraldry, a term describing a field or charge bearing a row of small squares, consisting of alternate metals and colors.

COMPOSITÆ, kŏm-pŏz'ĭ-tē (Lat. nom. pl., from *compositus*, p.p. of *componere*, to put together, from *com-*, together + *ponere*, to put, from *po-*, Gk. *ἀπό, apo*, off + *sinere*, to allow). The largest family of angiosperms, comprising approximately 1000 genera and over 13,000 species. This family is regarded as the culmination of the plant kingdom, i.e., the ranking family of plants. The nearest approach to it in number of species is the family Leguminosæ, with approximately 11,000 species. The familiar representatives of the family are such plants as the sunflower, aster, goldenrod, thistle, dandelion, etc. The name of the family is derived from the fact that the older botanists regarded the head of the flowers as a single flower, which they called a "compound flower." This so-called compound flower is really a community of flowers organized

together in a single structure called the *head*. Investing this head and resembling the calyx of an ordinary flower, is the *involucre*, which is a collection of bracts of various forms, colors, and relations to one another. The numerous small flowers stand upon a broad *receptacle*, which is ordinarily flat, but may be hemispherical to cylindrical. In some cases there are bracts upon this receptacle, among the flowers, in addition to the bracts upon the involucre that surround the whole head. These bracts of the receptacle are called *chaff*, and when they do not occur the receptacle is said to be *naked*.

There are two kinds of flowers which most commonly occur together in the same head. The outermost flowers usually have conspicuous petals and are called the *ray flowers*. The inner flowers, much the more numerous, form the *disk* within the ray flowers and are inconspicuous and tubular. In the sunflower, e.g., the yellow ray flowers are very conspicuous as contrasted with the numerous small flowers of the broad disk; while in the dandelion all the flowers have conspicuous corollas, so that there is no distinction between ray and disk flowers; in other cases there are no ray flowers, all the flowers being inconspicuous and tubular. These two kinds of flowers have been used to divide the Compositæ into two great series: *Tubuliflorœ*, those that have tubular flowers and also usually ray flowers; and *Liguliflorœ*, those that have no tubular flowers, all the flowers having conspicuous corollas, which are strap-shaped (ligulate).

The ordinary rôle of a calyx in protecting the more delicate parts within is taken by the involucre, and therefore, in the Compositæ the calyx is very much modified, being called the *pappus*. Familiar forms of pappus are a crown of delicate plumes, as in the dandelion and thistle down; a cluster of coarse bristles; barbed teeth as in Spanish needles, beggar-ticks, etc.; ordinary scales; or merely an inconspicuous crown. These various kinds of pappus have to do with the distribution of seeds, the plumed forms being carried about by the wind and the barbed forms catching in the fur of animals.

The stamens are very characteristic, the five filaments being distinct, but the anthers forming a tube. The anthers shed their pollen on the inside of the tube, through which the stigma is pushed by the elongation of the style, much as a swab is pushed through a cylinder. By this means the pollen is brought to the surface of the head, so that an insect moving about upon the head becomes dusted with it. The carpels are two in number, but mature as a dry seedlike fruit (*achene*) containing a single seed. The position of the achene indicates the advanced rank of the family, inasmuch as all the flower parts seem to rise from its apex (an epigynous flower).

There is great differentiation of flowers among the Compositæ in reference to the occurrence of stamens and pistils. All the flowers in a head may not have both of these organs. Among the Tubuliflorœ the most common situation is to find the ray flowers without stamens, or with neither stamens nor pistils (neutral), while the tubular disk flowers have both. In some cases the disk flowers are "sterile," and the ray flowers "fertile." In one group of the Tubuliflorœ the heads are differentiated, all the flowers of a head being either staminate or pistillate, and these two kinds of heads may occur on different plants. The two great series of Compositæ referred to are further divided into 13 tribes, whose names may be found in any manual. In the flora of the United States 10 of these tribes are represented, 9 of them belonging to the Tubuliflorœ.

It is somewhat remarkable that the largest family of angiosperms contains so few plants that have been found to be of economic importance. Aside from a certain number of species cultivated for their flowers or foliage, some of the most economically important species of Compositæ are lettuce, salsify, artichoke. Of course, chicory, dandelion, tansy, chamomile, etc., are common plants, but cannot be regarded as of economic importance. Medicinal properties are claimed for quite a number of species, as arnica, wormwood, elecampane, coltsfoot, etc.

COMPOSITE NUMBERS. See PRIMES.

COMPOSITE ORDER. See COLUMN; ORDERS OF ARCHITECTURE.

COMPOSITE SHIPS. Ships built with iron or steel frames and wooden planking. In some cases the framing is stiffened by keel plates, stringers, deck plates, longitudinals, etc. The planking is bolted to the frames and sometimes additionally pinned edgewise to the planks on each side. It is almost invariably sheathed with copper as a protection against fouling—indeed, it is chiefly to provide against fouling that ships are composite built. This method of construction never had much vogue in the mercantile marine; in the navies of the world it is rapidly falling into disuse on account of the galvanic action of the copper upon the plating and propeller shafts and struts, and because ships need docking sufficiently often for other reasons than fouling of the bottom to render the superiority of coppered ships in this respect of less importance than their inferior strength and increased cost. See SHIPBUILDING.

COM'POSI'TION (from OF., Fr. *composition*, from Lat. *compositio*, connection, from *componere*, to put together). In painting, that ordered arrangement of light and shade, of color and line, which shall directly impress the beholder with the thought and idea the artist wishes to express. The most important requisite of composition is unity. Every object must form a harmonious part of the whole and be in distinct relation to the rest of the picture. As Millet said: "A work should be all of a piece, and people and things should be there for an end." Whatever their color or shape, all objects in the picture should be seen under like conditions of light, shade, and atmosphere. There should be some object or objects of special interest, to which the remainder of the picture should be strictly subordinated.

The subject treated and the individuality of the artist usually determine the composition of a picture. There are, however, some generally accepted maxims in regard to linear composition which should be mentioned. The perpendicular line is one of dignity and severity, and its predominance in a picture produces a simple, majestic effect (e.g., the early Italian portraits). The predominance of the horizontal line produces an effect of repose or solemnity, as is seen in the composition of most landscapes. The flowing or waving line is the line of beauty and grace, and it is for this reason that the drawing of the human figure is esteemed so important.

There have been many theories of composition, more or less arbitrary. The Italians generally use the pyramidal composition, in which the Madonna forms the apex of the pyramid, with a

balanced group of standing or kneeling saints on either side. As art advanced, they also used the oval composition, in which the figures form a circle on the canvas (e.g., Raphael's "Madonna della Sedia"), the arch (Correggio's "Coronation of the Virgin"), the diamond shape (Sistine Madonna), and others. In landscape the themes of composition were even more numerous. In modern composition there is greater freedom, the artist following his own inclination. Nevertheless, he usually leans upon some well-established principles, although he may not be conscious of them, since analysis is the work of the critic rather than of the artist. Millet is an excellent example of a free and original method of composition in the modern sense. Consult: J. C. Van Dyke, *Art for Art's Sake* (New York, 1901); Blanc, *Grammaire des arts de dessin* (Paris, 1882); Burnett, *Practical Treatise on Painting* (London, 1880).

COMPOSITION AND RESOLUTION OF FORCES AND MOTIONS. See MECHANICS.

COMPOSITION WITH CREDITORS. In law, an arrangement made by an insolvent debtor with several or all of his creditors, by which they accept the payment of a percentage of their claims in full satisfaction and discharge of the whole. An agreement between a debtor and a single creditor that the latter will discharge the former from all liability upon the former's payment of a part of the debt is void by common law, because, it is said, this payment is no consideration for the creditor's promise to relinquish the balance of the debt, being only a payment of what the debtor already owed and was legally bound to pay. An agreement between a debtor and several or all of his creditors possesses an additional element. Such an agreement is binding upon all, it is said, because each creditor promises to release the balance of his claim, over and above the percentage paid to him, in consideration of such payment and also in consideration of the promises of other creditors to do likewise. It is held to be the substitution of a new agreement with different parties for an old debt. If any of the creditors entering into such a composition agreement stipulates secretly with the debtor for a preference to himself, his stipulation is void. Bankruptcy statutes often provide for and regulate composition proceedings between the bankrupt and his creditor. See BANKRUPTCY; CONTRACT.

COM'POST (OF. *composte*, It. *composta*, Portug. *composto*, mixture, from Lat. *componere*, to put together). A mixture of fertilizing materials which has been subjected to fermentation. Composts are usually prepared by mixing animal manures or other readily putrescible substances with peat (q.v.), straw, leaves, road scrapings, mud, loam, etc., with a view to causing fermentation and chemical changes, which will render these substances more active as fertilizers than they were in their original condition. Similar results are sometimes brought about by the use of ashes, lime, marl (qq.v.), alkali salts, etc. Frequently also preservative substances, such as gypsum, kainit, superphosphate (qq.v.), etc., are added to prevent the loss of ammonia or of nitrogen in the free state, which is likely to occur during fermentation. Composting is thus not only a means of rendering the constituents of various more or less inert materials more available as plant food, but also of preventing loss of the most valuable constituent of manures, viz., nitrogen. A compost which was formerly quite popular consists of alternate layers of barnyard manure, 1 part, and peat, 1–5 parts, the proportion of the latter depending upon the fermentative power of the manure. In this mixture the peat prevents the loss of ammonia and the valuable manure liquids, and the manure sets up a fermentation in the peat which greatly increases the availability of the inert nitrogen in which this material is comparatively rich. When lime, ashes, or lime and salt mixtures are substituted for manure in the peat compost, the alkaline character of these substances promotes the decomposition of the peat in much the same way as the manure. The fermenting compost heap has been utilized for the reduction of bones and ground mineral phosphates; and meat, fish, slaughterhouse refuse, etc., are sometimes incorporated in it, but composts containing any considerable amount of the latter substances are likely to be very offensive. Moreover, these materials are less benefited by the process than more inert substances. Composting is an effective means of "killing," i.e., destroying the germinating power of cottonseed intended for use as a fertilizer. This is done in Furman's formula for cotton, which formerly had considerable celebrity and is as follows: Barnyard manure, 750 pounds; cottonseed, 750 pounds; acid phosphate, 367 pounds; kainit, 133 pounds. The plan of composting these materials, which well illustrates the methods of composting in general, is briefly as follows: Put down on an impervious dirt floor first a layer of manure, then of cottonseed, and lastly of acid phosphate, in the proportions given, distributing the kainit throughout the different layers. Repeat the layers to any desired extent and cover the heap with absorbent earth. The heap should be kept moderately moist, and if made in the autumn should stand until spring, when it is dug down, mixed, and applied. Although composting furnishes a valuable means of converting waste materials of the farm into more active and better-balanced fertilizers, the labor involved is so great as to render the practice of doubtful economy for general agricultural purposes, especially since the general introduction of the more concentrated and active commercial fertilizers. (See MANURES AND MANURING.) Composts have been recommended especially for use on grass lands and on stiff soils or on those deficient in humus. They find their greatest usefulness, however, in horticultural operations—for plant beds, potting, and for use on vines, fruits, etc., which might be injured by more concentrated fertilizers. Perennial plants, or those having long periods of growth, will utilize the fertilizing matter of composts to the best advantage. Composts are not so well suited to the forcing of quick-growing crops as commercial fertilizers. For further information regarding composts, consult: Dana, *Muck Manual for Farmers* (4th ed., New York, 1858); Storer, *Agriculture in Some of its Relations with Chemistry* (7th ed., ib., 1897); Johnson, *Peat and its Uses as Fertilizer and Fuel* (ib., 1866); Sempers, *Manures: How to Make and How to Use Them* (Philadelphia, 1893); Brooks, *Agriculture* (Springfield, Mass., 1901); Thorne, *Farm Manures* (New York and London, 1913).

COM'POSTEL'LA, ORDER OF SAINT JAMES OF, or ORDER OF SAINT JAMES OF THE SWORD. An order of knighthood in Spain. To defend the multitude of pilgrims that thronged to the shrine of St. James at Compostella (Santiago), in

Galicia, Spain, from the Moors, 13 noblemen formed themselves into a military order, under the auspices of the Pope, in 1175. With time the order rose to immense power and wealth. It fought valorously in all the Moorish wars and exercised great political influence. But its rich towns and abbeys tempted Ferdinand and Isabella, who took possession of its property in 1493 and held it until 1522, when a papal bull vested the permanent grand mastership in the crown.

COMPOUND, Chemical. See Chemistry.

COM'POUND ANIMALS. Such animals as are made up of a number of morphological units, called *persons*, which are organically connected throughout life. The connection results from a budding process, in which the buds never become separated from the parent stock. Compound animals are found among protozoans, sponges, cœlenterates, certain flatworms (planarians and tapeworms), bryozoans, some annelids (*Syllis*), and tunicates. The degree of connection varies. When it is loose, the complex is called a "stock"; when close, a "corm," as in sponges. Most compound animals are sessile, but the siphonophores, flatworms, and some tunicates swim free. The opposite of this term is "simple animals."

COMPOUND BLOWPIPE. See Oxyhydrogen Blowpipe.

COMPOUND FRACTURE. A fracture of a bone accompanied by a wound which opens from the surface of the body to the break in the bone. Infection of the bone being thus rendered possible, a compound fracture is more serious than a simple fracture. See Fracture.

COMPOUNDING OF FELONY. The offense of taking value for forbearing to prosecute a felony. This offense is punishable with fine and imprisonment. Compounding of informations upon penal statutes and compounding of misdemeanors are also illegal and are punishable in a lighter degree. In Great Britain the compounding of misdemeanors is permitted in some cases with the leave of the court, especially in the case of a misdemeanor affecting private (and not public) rights. Accepting a promissory note signed by a party guilty of larceny, as a consideration for not prosecuting, is enough to constitute the offense; but the mere retaking of stolen goods by the owner is not an offense, unless it is agreed that the thief is not to be prosecuted. A note or other obligation given in consideration of stopping a criminal prosecution or an agreement not to prosecute is void. See Criminal Law, and the authorities there referred to.

COMPOUND INTEREST. See Interest.

COMPOUND MICROSCOPE. See Microscope.

COMPOUND PIER. See Clustered Pier.

COM'PRADOR' (Sp., Portug., purchaser). In China, Japan, and the Philippines, a man who contracts for the supply of provisions to ships.

COMPRESSED AIR. See Power Transmission; Air Compressor; Compressed-Air Engine; Compressed-Air Locomotive; Pneumatic Tools; Pneumatic Dispatch.

COMPRESSED-AIR ENGINE. An engine using as a motor fluid air to which a degree of energy has been imparted by compression by mechanical means. When atmospheric air is compressed in an air compressor (see Air Compressor), energy is stored in it which is available for work in a piston motor just as in the energy stored by heat in steam. Any form of engine which will operate with steam as a motive fluid will also operate with compressed air as a motor fluid; i.e., a steam engine will become a compressed-air engine simply by disconnecting the steam boiler and substituting a receiver or reservoir of compressed air. Compressed air is, however, employed to replace steam only under those conditions in which it is necessary to transmit the motor fluid to motors located at scattered points some distances from the source of supply; and where the exhaust steam would be objectionable, while the exhaust air is not, as in mines or confined chambers or submarine vessels; and where the energy must be carried on a vehicle without heat, as on street railways. The reason for this is that while it is not possible to convey steam through pipes or to carry it in inclosed vessels for long distances without a great loss of energy due to condensation, it is practicable to do this with compressed air, with a comparatively small loss of energy if the air be heated before it is delivered to the motors at the end of its journey. Hence compressed-air engines are practically always motors of special forms for performing special operations and are usually of small size. For descriptions of the various special forms of compressed-air engines in common use, see Drill: Pneumatic Tools; Power Transmission; Street Railway.

COMPRESSED-AIR LOCOMOTIVE. A locomotive engine in which air under pressure takes the place of steam as the propulsive force. Compressed-air locomotives occupy a rather limited field of usefulness, their chief applications being street-railway propulsion on a limited scale, mine, quarry, and tunnel haulage, and haulage around cane plantations, saw mills, cotton presses and warehouses, textile works, and powder mills, where the risk of fire has to be carefully avoided. Structurally, a compressed-air locomotive has the same form of propelling mechanism as a steam locomotive, but in place of the boiler there are tanks for holding compressed air, these tanks being recharged at intervals at a stationary air-compressor plant. A brief description of the use of compressed-air locomotives for street-railway propulsion and for mine haulage will give a fair idea of the two distinctive classes of these motors.

Street Railway Motor Cars. Numerous attempts have been made in the United States to employ compressed air for propelling street-railway cars; but, with the exception of a few short lines operating under special conditions, these attempts have all resulted in commercial failures. Probably the most extensive experiments have been conducted in New York City, on some of the railway lines crossing the city from east to west. In all of these experiments a motor-driven car has been employed carrying the tanks underneath the seats or under the floor of the car. In Europe the Mekarski system of compressed-air street-car locomotion has been used apparently with considerable success in Paris, France, and Berne, Switzerland. A special feature of the Mekarski system is the heating of the air, to maintain it at a constant temperature, by passing it through superheated water at 330° F. The air thus becomes saturated with steam, which subsequently partly condenses, its latent heat being absorbed by the expanding air. The pressure used at Berne in the car reservoirs is 440 pounds per square inch. The engine is constructed like an ordinary steam

tramway locomotive and drives two coupled axles spaced 5.2 feet apart. It has a pair of outside horizontal cylinders, 5.1 by 8.6 inches; four coupled wheels, 27½ inches in diameter. The total weight of the car, including compressed air, is 7¼ tons. The storage tanks consist of 10 sheet-iron cylinders with an aggregate capacity of 64¼ feet of compressed air. The cars will run for 4 miles without refilling the reservoirs. On the Paris lines the pressure used is 547 pounds, and the cars make trips of 7 miles without refilling the reservoirs.

Mining Locomotives. As generally constructed, the air for mining locomotives is stored in one or two steel tanks having a cubic capacity designed for the length of run, weight of train, grades, etc. These tanks usually occupy the space that the boiler does on an ordinary steam locomotive. The air from the main tank or tanks is conducted through copper-pipe connections to an auxiliary reservoir of suitable diameter. The pressure in this auxiliary tank can be regulated (usually 150 pounds) anywhere from 30 pounds up to 300 pounds, as required. The air is reduced and controlled from the main tank by a reducing valve and stop valve, and can be regulated to any pressure at a moment's notice; when once set, a constant pressure is maintained in the auxiliary reservoir. The air is fed to the engine cylinders from the auxiliary reservoir. Compressed-air locomotives for industrial uses are built substantially the same as mining locomotives. Electric locomotives have largely replaced the air-propelled types.

From the preceding it will be seen that the two types of compressed-air locomotives are the compressed-air motor car for street-railway propulsion and the compressed-air locomotive proper for mine, plantation, and factory haulage. In both forms the original prime motive power is usually steam, or a head of water whose energy, as it comes from the boiler or hydraulic motor, is employed to drive the air compressors; and, as transformed and stored in the compressed air, to propel the car motor or locomotive proper. See AIR COMPRESSOR; COMPRESSED-AIR ENGINE.

COMPRESSED-AIR TREATMENT. A term applied to the use of air under pressure for therapeutic purposes. The treatment is administered in one of the following two ways: (1) by causing the patient to enter an air-tight chamber, in which air is forced under pressure till the desired density is obtained; (2) by causing the patient to enter a cabinet in which he is seated in such a position as to receive into his mouth the end of a tube which, passing through the front of the cabinet, connects the cavity of his lungs with the outside atmosphere, while an apparatus on the roof of the cabinet is so arranged as to pump air out of the cabinet. In the air-tight room the pressure upon all parts of the patient's body, including the lung cavity, is the same. In the cabinet the pressure within the lung cavity is many times greater than on the rest of the body, thus causing great expansion of the lungs and chest. The latter treatment relieves collapse of pulmonary vesicles and consolidations in many cases; the former treatment is said to cause increased absorption of oxygen and an improved function of the mucous membrane of the respiratory tract. Both methods of treatment are used in cases of tuberculosis, and the former also in chronic bronchitis and asthma, at certain water cures. See AËROTHERAPEUTICS; TUBERCULOSIS; CAISSON DISEASE.

COMPRESSIBILITY (from Lat. *compressus*, p.p. of *comprimere*, to compress, from *com*, together + *premere*, to press). That property of bodies by which they admit of being pressed into less space than they otherwise occupy. It is measured by the relative change of volume produced by the application of unit pressure. The particles composing bodies are in all cases at greater or less distance from one another; and whatever brings the particles closer together diminishes the volume or bulk of the body. This may be effected by various agencies, as, e.g., by the withdrawal of heat, but the effect is called compression only when it is caused by mechanical force, as by pressure or by percussion. All bodies are compressible, but in different degrees. Solids and liquids were at one time believed to be incompressible; more accurate experiments, however, have proved that this is not the case; water, e.g., subjected to a pressure of 15,000 pounds to the square inch, loses one-twentieth of its volume, and under greater pressures the loss of volume is still greater. The law connecting the pressure and volume of solids or liquids at constant temperature is as yet unknown; it will probably remain unknown until the molecular condition of substances in these states of aggregation is more perfectly understood than it is to-day. Gases are strikingly compressible, and by means of a common air pump a very large amount of air can be forced into the space of one cubic inch. The variation of the volume of a gas with the pressure is expressed by the law of Boyle and Mariotte as long as the pressure is moderate. Under greater pressures gases follow approximately the law of Boyle and Mariotte as modified by Van der Waals. See GAS; MOLECULES—MOLECULAR WEIGHTS.

COMPRES'SOR. An instrument used on shipboard for temporarily checking the running of the anchor chain. It consists usually of a curved arm pivoted at one end and arranged to be swung across the underside of the chain pipe through the deck and grip the chain by pressing it against the lip of the pipe. The term was also applied to an attachment to old-type guns for checking the recoil by squeezing two or more surfaces together and thus increasing the friction.

COMPRESSOR, AIR. See AIR COMPRESSOR.

COM'PROMISE MEASURES OF 1850, or OMNIBUS BILL. A name popularly given to a series of measures passed by the United States Congress in 1850, directed to a general settlement of certain questions arising out of the struggle over slavery. The affirmance of American rights in the Oregon territory, by the Treaty of 1846 with England, and the acquisition of still larger territories from Mexico by the Treaty of Guadalupe-Hidalgo (q.v.), made urgent the problem of providing suitable governments for this territory, and at the same time made acute the controversy between North and South over the securing of acceptable provisions concerning slavery in the statutes organizing such governments. One phase of this controversy ended with President Polk's approval, Aug. 14, 1848, of a bill providing for the erection of territorial government in Oregon with a prohibition against slavery. With reference to the territory acquired from Mexico, the problem was complicated by the fact that Mexico had abolished slavery in her dominions, by the question whether the line of the Missouri Compromise (q.v.) extended to the Pacific, and also by the question whether Congress might admit into the Union

a State which had not passed through the Territorial stage of organization. The necessity of an early decision was emphasized by the sudden peopling of much of this Territory, incident to the discovery of gold. Under such circumstances Henry Clay offered in the Senate, on Jan. 29, 1850, a general scheme of adjustment, which provided that California should be admitted as a State with her free constitution; that Territorial governments should be created in the other portions of the Mexican cession without reference to slavery; that trading within the District of Columbia in slaves brought there for purpose of sale should be forbidden; that there should be a more stringent fugitive-slave law; and that Texas should release all claims on New Mexico in return for the assumption by the national government of the old Texan debt. These proposals were attacked both by the Southern friends of slavery and by the more extreme antislavery element at the North. After several weeks of heated debate, including the last speech of Mr. Calhoun (q.v.) and the famous Seventh of March speech of Mr. Webster (q.v)., the whole matter was referred to a committee of 13, from which committee, on May 8, Mr. Clay reported three bills. The first provided, in addition to details as to the debt and boundary of Texas, for the admission of California with its antislavery constitution, and for the Territorial organization of Utah and New Mexico (then including the present Arizona) in such form that slavery should be allowed in those Territories. The second bill provided for a modified fugitive-slave law. The third bill provided for the abolition of the slave trade in the District of Columbia. Three months even then were occupied with animated and protracted discussions, with the result that the whole scheme of compromise seemed to have proved a failure. Mr. Fillmore, however, having succeeded to the presidency upon the death in July of President Taylor, adopted a policy more favorable than had his predecessor to the measures proposed, with the result that practically the whole of Clay's plan eventually became law, although divided into several statutes. The Senate passed the bill for the organization of Utah on August 1, that concerning Texas on August 9, that for the admission of California on August 13, that concerning New Mexico on August 15, the new fugitive-slave law on August 26, and, finally, the law prohibiting the slave trade in the District of Columbia on September 16. Before the end of September all these bills had passed the House and had been signed by the President. The arrangement thus effected was accepted by both parties in the campaign of 1852, in the "finality" planks of their platforms, and the slavery question was generally regarded as settled. The quiet was broken abruptly, however, and the whole controversy renewed with increased bitterness when Stephen A. Douglas (q.v.) introduced his bill for the organization, in 1854, of Kansas and Nebraska, and thus precipitated the battle anew both on the fields of Kansas and in the halls of Congress.

In the first volume of Rhodes, *History of the United States from the Compromise of 1850* (new ed., New York, 1901), a careful review is given of all the circumstances connected with this famous compromise, including sketches of the chief participants in the debates. A shorter review of the situation is given in the fifth volume of Schouler, *History of the United States under the Constitution* (Washington, 1889). The lives of statesmen of the period should also be consulted. See SLAVERY.

COMPTOM'ETER. See CALCULATING MACHINES.

COMP'TON, EDWARD (MACKENZIE) (1854–). An English actor, born in London. He made his first appearance at the new Theatre Royal, Bristol, in 1873, and his first appearance in London at Drury Lane in 1877. He accompanied Adelaide Neilson on her American tour, returning in 1880. In 1881 he organized the Compton Comedy Company, and with this organization during a period of 30-odd years he built up a repertory of more than 50 plays. In 1911 he was associate manager of the Kennington Theatre, and in 1912 and 1913 he toured as Nobody in *Everywoman*.

COMPTON, HENRY (1632–1713). An Anglican bishop of Oxford (1674) and of London (1675). He was born at Compton Wyngates and was educated at Oxford. He was the tutor of the daughters of James II, Mary and Anne, who through his teachings became attached to the Protestant faith. In 1686, at the instigation of James, he was suspended by the high court of ecclesiastical commission from further exercises of episcopal functions, on the alleged ground of having permitted the preaching of controversial sermons within his dioceses. This suspension was reversed in 1688. Compton was one of the active leaders of the revolution of 1688, and he used his influence to have William and Mary crowned King and Queen of England. He presided over the Upper House of Convocation in 1689 and assisted in the revision of the liturgy.

COMPTROLLER, kon-trōl'er, or **CONTROL'LER** (OF. *contreroleur*, Fr. *contrôleur*, from ML. *contrarotulator*, keeper of a check roll). An officer who keeps financial accounts or sees that they are properly kept and audited. In the United States Treasury Department the Comptroller of the Treasury supervises and reviews the actions of the various auditors of the Treasury, upon appeal, advises the heads of departments as to constructions of laws, and countersigns all warrants of the Secretary of the Treasury. The Comptroller of the Currency has charge of the execution of the laws relating to the issue and regulation of the national bank currency and has a general supervision of the national banks. By the Banking Act of Dec. 23, 1913, the Comptroller is made a member of the Federal Reserve Board, having supervision over the reserve system created by the law. State and municipal comptrollers in the United States have duties similar to those of the Federal officials.

COM'PURGA'TION (Lat. *compurgatio*, purification, from *compurgare*, to purify, from *com-*, together + *purgare*, to purge, from *purus*, pure + *agere*, to perform). An ancient method of proof in legal proceedings, generally known in England as the "wager of law." It consisted in the purgation, i.e., the purging or clearing, of a defendant by the sworn oaths of a certain number of other persons. The procedure was singular in this, that the witnesses swore, not to their knowledge of the fact in issue, but to their belief that the defendant was telling the truth. The number of compurgators was often 12; but it varied according to the rank of the person accused and according to the seriousness of the crime or action. It was seldom employed when the proof of the crime was accessible.

When it had been allowed and proof of the man's guilt was afterward obtained, the compurgators usually suffered the same penalty as the accused. The procedure was available in many forms of civil suit and in criminal proceedings. Compurgation was employed as a part of the regular procedure of the ecclesiastical courts throughout Europe in the Middle Ages. It existed among the Anglo-Saxons and was in use in the courts of the common law in England until it was gradually superseded by the jury system. Though long obsolete, it was revived in England in an action of debt as late as 1824 (Ring *v.* Williams, 8 Barn. and Cress. 5387). It was not until 1833 that it was finally abolished by Act of Parliament (2 and 3 Will. IV, c. 42, § 13). In other European countries, except Spain, it was in use later than in England; in Italy it was employed in a clerical court in November, 1904. It never existed in the legal procedure of the United States or of the English Colonies in America. See JURY; OATH; PROOF; WITNESS. The procedure is elaborately discussed by Blackstone, *Commentaries on the Laws of England*. See also Inderwick, *The King's Peace: A Historical Sketch of English Law Courts* (London, 1895); Stephen, *History of the Criminal Law of England* (ib., 1883); Pollock and Maitland, *History of English Law* (2d ed., Boston, 1899); Lea, *Superstition and Force* (4th ed., Boston, 1892).

COM'STOCK, ANTHONY (1844–1915). An American reformer, born in New Canaan, Conn. He was educated at high schools in his native State and during the Civil War served in the Union army from 1863 to 1865. Afterward he became an active worker in the Young Men's Christian Association in New York City and upon the organization of the Society for the Suppression of Vice in that city (1873) was appointed chief special agent. Thereafter he attained considerable prominence by his vigorous crusade against such books, papers, pictures, and establishments as he considered injurious to the public morals. He published: *Frauds Exposed* (1880); *Traps for the Young* (1883); *Gambling Outrages* (1887); *Morals Versus Art* (1887); and magazine articles relating to similar subjects.

COMSTOCK, CYRUS BALLOU (1831–1910). An American soldier and military engineer. He was born in West Wrentham, Mass., graduated at West Point in 1855, was appointed lieutenant engineer, and from 1859 to 1861 was assistant professor of natural and experimental philosophy at the Military Academy. After serving in the construction of the defenses of Washington and with the Army of the Potomac in 1862 he became chief engineer of that army. He was subsequently engaged in the siege of Vicksburg, was chief engineer of the Army of the Tennessee in 1863, was assistant inspector general of the Division of the Mississippi in 1863–64, and senior aid-de-camp to General Grant in 1864–66. At the close of the war he was brevetted major general of volunteers and brigadier general in the regular army, and from 1866 to 1870, was aid-de-camp to the general in chief, with the rank of colonel. Afterward for several years he was superintending engineer of the geodetic survey of the Northern and Northwestern lakes. In 1888 he became colonel in the engineer corps and was retired from active service in 1895. He was promoted on the retired list to be brigadier general in 1904. His publications include: *Notes on European Surveys* (1876); *Survey of the Northwestern Lakes* (1877); *Primary Triangulation United States Lake Survey* (1882); *A Comstock Genealogy* (1907).

COMSTOCK, GEORGE CARY (1855–). An American astronomer, born at Madison, Wis. He graduated at the University of Michigan in 1877 and in law at the University of Wisconsin (1883). He also studied mathematics and astronomy and in 1881 was appointed assistant astronomer at the Washburn Observatory of the University of Wisconsin. In 1885 he was made professor of mathematics at the Ohio State University, but in 1887 returned to the University of Wisconsin as associate director of the observatory, of which he was afterward made head director. He became a member of many scientific bodies. His works include: *Method of Least Squares* (1890); *Publications of the Washburn Observatory; Observations of Double Stars*, vols. vi–xii (1896–1906); *Text-Book of Astronomy* (1900); *Text-Book of Field Astronomy for Engineers* (1902; 2d ed., 1908).

COMSTOCK, JOHN HENRY (1849–). An American entomologist, born at Janesville, Wis. He was educated at Cornell University, where he became first instructor, then assistant professor, and, in 1882, professor of entomology and general invertebrate zoölogy. From 1878 to 1881 he was United States entomologist. In 1891 he became nonresident professor of entomology at Leland Stanford Junior University. His investigations deal with the morphology, classification, and economic relations of insects. In this work he has been assisted by his wife, Anna Botsford Comstock, who is herself an entomologist and prominent in the educational movement emanating from Cornell University towards the general extension of nature study. His important publications include: *Report on Cotton Insects* (1879); *Annual Report of the Entomologist* (1879–81); *Introduction to Entomology*, part i (1888); *Evolution and Taxonomy* (1893); *A Manual for the Study of Insects*, with his wife, Anna Botsford Comstock (1895); *The Wings of Insects*, with J. G. Needham (1897); *Insect Life* (New York, 1901); *How to Know the Butterflies of the Eastern United States*, with his wife (1904); *The Spider Book* (New York, 1912).

COMSTOCK, JOHN LEE (1789–1858). An American author of textbooks. He was born at Lyme, Conn., and after a common-school education took up the study of medicine. He served as assistant surgeon in the War of 1812 and at its close settled in Hartford, where he devoted himself to writing and the preparation of textbooks on the various sciences and history. His *System of Natural Philosophy* (1831) reached a sale of 900,000 copies, while other popular works from his pen were an *Introduction to Mineralogy* (1832); *History of the Precious Metals* (1849); *History of the Greek Revolution* (1828).

COMSTOCK, THEODORE BRYANT (1849–). An American geologist, born at Cuyahoga Falls, Ohio. He graduated at the Pennsylvania State College in 1868 and at Cornell in 1870 and in 1873 accompanied Capt. W. A. Jones's Wyoming and Yellowstone Park expedition as geologist. From 1875 to 1879 he was professor of geology and paleontology at Cornell, where he established the department of economic geology. He acted in 1879–84 as general manager of a mining company at Silverton, Cal., and from 1884 to

1889 occupied the chair of mining engineering and physics at the University of Illinois. He was assistant State Geologist of Arkansas in 1887–88 and of Texas in 1889–91; in the latter year he founded the Arizona School of Mines, which he directed until 1895, and from 1893 to 1895 was president of the University of Arizona. In 1886 he was elected secretary of the geological and geographical section of the American Association for the Advancement of Science. He published *The Scientific Value of the Yellowstone Park* (1874); *Outline of General Geology* (1878); *Classification of Rocks* (1877); and many papers dealing with the geology and mineral deposits of Colorado, Texas, Wyoming, and other parts of the West.

COMSTOCK LODE. A remarkable compound-fissure vein, rich in gold and silver, located in Storey Co., Nev., on the eastern slope of Mount Davidson, a northeastern spur of the Sierras, at a point about 20 miles east of the California State line. Its discovery in 1859, when it received the name "Washoe," created great excitement and led to the building up of Virginia City. The vein is about 4 miles in length and varies in width from zero at the ends to 3000 feet at the middle point. It occupies a zone of displacement in igneous rocks, chiefly andesites of Tertiary age. The ore, which is of high grade, containing both silver and gold in proportion of three of the former to two of the latter, occurs in great pockets known as bonanzas, chiefly along the eastern portion of the vein. The excavations along this fissure vein have been carried to great depths, approximating 3500 feet, until operations became difficult through the inflow of hot water with a temperature of 170° F. The Sutro Tunnel, with a length of 4 miles, was driven with a view to draining this water, but with only partial success. The richness of the ore of this lode may be realized from the value of the product, the total value during the years 1860–90 having been $340,000,000; the greatest output for a single year was $38,000,000 in 1877. Since 1890 the production has declined.

Besides its economic value, the Comstock Lode is of great interest in other directions. One of the earliest classifications of igneous rocks (q.v.) was attempted in connection with the study of the geologic relations of the ore bodies by Von Richthofen in 1868; and Van Hise, Iddings, and Becker have at a later period perfected the modern classification of igneous rocks with the aid of considerable information derived from the Comstock Lode and Sutro Tunnel. Also many important observations have been made on the relation between the size of grain and the rate of cooling, and upon the rate of development of crystallization in igneous rocks. Again, experiments have here been carried on by Carl Barus with the object of determining the temperature variations and electric manifestations in the deeper workings. For more precise information on the geologic features and methods of mining of the Comstock Lode, the reader is referred to the following works: Becker, "Geology of the Comstock Lode and Washoe District," with folio atlas; being *Monograph of the United States Geological Survey*, vol. iii (Washington, 1882); Lord, "Comstock Mining and Miners," *Monograph of the United States Geological Survey*, vol. iv (ib., 1883); Reid, *Structure and Genesis of the Comstock Lode* (Berkeley, Cal., 1905).

COMTE, kônt, Isidore Auguste Marie François Xavier, known generally as Auguste Comte (1798–1857). A celebrated French philosopher, the founder of the positive philosophy, or positivism (q.v.). He was born at Montpellier, and educated at the Ecole Polytechnique in Paris, from which he was expelled for his part in a protest of students against one of the instructors. From 1816 he supported himself by tutorial work. In Paris he met Saint-Simon, with whose theories he was at first greatly charmed, but from whose influence he broke away in 1824. In the following year he married Caroline Massin, but the union was unhappy. In 1826 he began a course of lectures at his own house on his system of philosophy and had among his hearers such men as Humboldt and Blainville. Excessive work, however, ruined his health, and after the third lecture he became insane, was taken to an asylum, and tried to commit suicide. He soon recovered the use of his faculties and took up his studies and lectures again. In 1836, he got a position as examiner for entrance to the Ecole Polytechnique, which he held for some 10 years; afterward he was largely supported by his pupils and admirers. John Stuart Mill, with whom Comte had been in correspondence for some time, induced some wealthy English friends to advance about $1200 to Comte in 1845. In 1848 Littré headed an appeal for a public subscription for the benefit of Comte, who subsisted on the proceeds of it for the remainder of his life. In 1845 he met Clotilde de Vaux, whose husband was serving a life sentence, and conceived an extravagant affection and admiration for her. The relation was broken by her death a year later, after which Comte had a second attack of mental alienation. His death took place on Sept. 5, 1857.

Comte published a number of important philosophic works, the most famous being his *Cours de philosophie positive* (6 vols., 1830–42), of which a condensed English translation by Harriet Martineau, approved by the author, appeared in 1853. Other works were: *Traité élémentaire de géométrie analytique* (1843); *Traité d'astronomie populaire* (1845); *Système de politique positive* (4 vols., 1851–54; Eng. trans., London, 1875–77); *Catéchisme positiviste, ou sommaire exposition de la réligion universelle* (1852). Comte's central and governing doctrine is that the human race, like the individual, necessarily passes through three intellectual stages: (1) the theological, in which a supernatural origin is sought for all phenomena, and the *deus ex machina* is the only explanation of events; (2) the metaphysical, in which the sensuously supernatural is set aside, and an effort is made to demonstrate the existence of "abstract forces or entities supposed to inhere in various substances and capable of engendering phenomena"; (3) the positive, in which the mind affirms the futility of both theological and metaphysical inquiries, abandons all vain search after the causes and essences of things, and "restricts itself to the observation and classification of phenomena, and to the discovery of the invariable relations of succession and similitude which things bear to each other—in a word, to the discovery of the laws of phenomena." Theology and metaphysics are alleged to be in their dotage, and all the anarchy of modern life to arise from the presence of these disturbing elements. To deliver us from their hurtful influence, Comte

employs the principles of positivism to organize a new social doctrine, which shall embrace the entire wants of man as an intellectual and emotional being. He thus aims at being the founder, not only of a new philosophy, but also of a new religion, and even assumed the title of *Fondateur de la réligion de l'humanité*. See POSITIVISM; and consult: Littré, *Auguste Comte et la philosophie positive* (Paris, 1877); Mill, *Comte and Positivism* (London, 1865); Caird, *The Social Philosophy and Religion of Comte* (Glasgow, 1885); Gruber, *August Comte, sein Leben und seine Lehre* (Freiburg, 1889); the first volume of Fiske, *Outlines of Cosmic Philosophy* (Boston, 1874); Levy-Bruhl, *La philosophie d'Auguste Comte* (1900, Eng. trans., 1903); L. de Montesquieu Fezensoc, *Le système politique d'Auguste Comte* (1907).

COMTE DE BOURSOUFLE, kônt de bōōr'-sōō'fl', LE (Fr., The Count of Boursoufle). A comedy by Voltaire, produced in public, posthumously, in 1862. It had been privately acted, however, at the Château de Cirey in 1734, and again at the Château d'Anet in 1747, under the title of *Quand est-ce qu'on me marie?* It was drawn from Vanbrugh's *Relapse*.

COMTE DE PARIS, de pȧ'rē'. See PARIS, LOUIS PHILIPPE ALBERT D'ORLÉANS, COMTE DE.

COMUM. See COMO.

CO'MUS (Lat., from Gk. Κῶμος, *Kōmos;* compare *κῶμος*, revel, or band of revellers). A Greek god of revelry, who first appears clearly personified in the third century A.D. (See PHILOSTRATUS, 3, 4.) Philostratus describes Comus as a winged youth slumbering in a standing attitude, his legs crossed, his countenance flushed with wine, his head sunk upon his breast, his left hand feebly grasping a hunting spear, his right hand an inverted torch. Milton, in his poem "Comus," has represented Comus as born from the loves of Bacchus and Circe, "much like his father, but his mother more"; a sorcerer, who gives to travelers a magic draught that changes the human face into the "brutal form of some wild beast," and makes them, hiding from them their own foul disfigurement, forget all the purities of life, "to roll with pleasure in a sensual sty."

COMYN, kŭm'ĭn. A family which rose to great power and eminence in Scotland after the Norman Conquest. The name is also spelled Comin, Comines, or Cumin.—ROBERT DE COMYN, the founder of the family, was probably from Flanders and followed William the Conqueror to England. He was made Earl of Northumberland in 1068. In 1069 he was sent to reduce the provinces of the North. He seized Durham, but the people rose against him, and he perished in the flames of the Bishop's palace. The family became most prominent in the thirteenth century.—WILLIAM COMYN, who died in 1233, obtained the earldom of Buchan by marriage. WALTER, one of his sons by his first marriage, became Earl of Monteith. After the accession of Alexander III of Scotland, Walter practically ruled the kingdom till 1255. He died in 1258.—ALEXANDER, Earl of Buchan, his half-brother, by marrying a daughter of the Earl of Winchester, acquired, in 1270, the high office of Constable of Scotland, with great estates in Galloway, Fife, and the Lothians. He was the most powerful noble in Scotland until his death, in 1289. Within a quarter of a century, however, this great house suffered such utter misfortune that, in the words of a contemporary chronicle, "there was no memorial left of it in the land, save the orisons of the monks of Deer" (a monastery founded by William Comyn, Earl of Buchan, in 1219). The Comyns perished in the memorable revolution which placed Bruce on the throne of Scotland. Their chief, the Lord of Badenoch, was in 1291 an unsuccessful competitor for the crown, as a descendant, through King Donald Bane, of the old Celtic dynasty. His son, Red JOHN COMYN, was one of the three wardens of Scotland and distinguished himself by his gallant resistance to the English. He fell under Bruce's dagger, before the altar of the Franciscan Friars at Dumfries, in 1306; and his kindred went down, one after another, in the struggle to avenge him.—JOHN COMYN, Earl of Buchan, was defeated by Bruce in a pitched battle near Inverary in 1308, and his earldom was laid waste. He fled to England, and died in 1313, leaving no children. The possessions of the family, both in Scotland and England, were taken by the King. Consult Douglas, *Peerage of Scotland* (Edinburgh, 1764), and Burton, *History of Scotland* (8 vols., Edinburgh, n.d.).

CON. An Italian preposition, meaning 'with,' much used in musical terminology; thus, *con spirito, con brio.* The form *col*, a contraction of *con* and *il*, means 'with the.'

CONACHAR, kŏn'ȧ-kär. A character in Scott's novel *The Fair Maid of Perth.*

CONAN'ICUT. An island of the State of Rhode Island at the mouth of Narragansett Bay (Map: Rhode Island, C 4). It is about 8 miles long by 1 mile wide and comprises the township of Jamestown. The village of the same name lies on the east coast of the island, about 2½ miles nearly due west of Newport. At the northern extremity of the island is Conanicut Park. The township was incorporated in 1678 and was named in honor of King James II. Pop. (of township), 1910, 1175.

CO'NANT, CHARLES ARTHUR (1861–1915). An American expert on banking and finance. He was born in Winchester, Mass., studied in public schools and with private tutors, and from 1889 to 1901 was correspondent in Washington, D. C., for the New York *Journal of Commerce.* He did important work for the gold standard and the gold-exchange standard and aided in the development of a monetary system in the Philippines. An Imperialist, on this and the monetary issue, he left the Democratic party. He was treasurer of the Morton Trust Company of New York City in 1902–06; was a member of the New York Chamber of Commerce committee on currency reform (1906) which recommended a central bank; and in 1910 was American delegate to The Hague Conference on Bills of Exchange. He wrote many articles for periodicals and encyclopædias on American banking and on Latin-American finance and trade, and published: *A History of Modern Banks of Issue* (1896; 4th ed., 1909); *Alexander Hamilton* (1901); *Wall Street and the Country* (1904); *The Principles of Money and Banking* (1905; also French trans.).

CONANT, HANNAH O'BRIEN CHAPLIN (1809–65). An American biblical scholar. She was born in Danvers, Mass., the daughter of a clergyman, and in 1830 was married to Thomas Jefferson Conant. In 1838 she became the editor of *The Mother's Journal.* She assisted her husband, translated from the German Strauss's *Baptism in Jordan* (1844), Neander's commen-

tary on Philippians (1851), and Uhden's *The New England Theocracy* (1859), and wrote *The Earnest Man*, an excellent biography of Adoniram Judson (1855), and a *Popular History of English Bible Translation* (1856).

CONANT, THOMAS JEFFERSON (1802–91). An American biblical scholar. He was born at Brandon, Vt., graduated at Middlebury College (Middlebury, Vt.) in 1823, and was professor of Greek, Latin, and German in Waterville College (now Colby College) in 1827–33. From 1835 to 1850 he was professor of biblical literature and criticism in the Baptist Theological Seminary at Hamilton, N. Y. He translated (1839) Gesenius' Hebrew Grammar, with the additions of Roediger, which became a standard textbook in English. With Moses Stuart (q.v.), a later translator of Gesenius, he had a long controversy. He was professor of Hebrew and biblical exegesis in Rochester Theological Seminary from 1851 until 1857 and then devoted himself to Bible revision for the American Bible Union until 1875. He published in 1864 a treatise on the term *βαπτίζειν* in the New Testament, which is a classic statement of the philological evidence for immersion. Dr. Conant was one of the American committee on the revision of the Bible. He published critical editions, with revised versions of *The Book of Job* (1856), *The Gospel by Matthew* (1860), *The New Testament* (1866), *The Book of Genesis* (1868), *The Book of Psalms* (1872), *The Book of Proverbs* (1872), *Isaiah i.–xiii.* (1874), and *Historical Books of the Old Testament* (1884).

CONA'TION (Lat. *conatio*, attempt, from *conari*, to attempt). An endeavor, a striving to attain something. The attempt, e.g., to recall a name which has slipped from memory is a conation. There is a difference of opinion among psychologists as to whether conation is an ultimate aspect of consciousness or a complex of sensation (q.v.) and affection (q.v.).

There are two typical cases of conation—the consciousness accompanying muscular exertion, and the state of active attention. (See ATTENTION.) The similiarity of these two experiences has led some psychologists to deny that there is anything more in conation than the strain sensations following upon muscular contraction *plus* a pleasantness or unpleasantness. In attention there are, further, the sensations or ideas attended-to and those attended-from. But it is also maintained, on the other hand, that conation is a simple "attitude" which mind assumes towards its objects, a peculiar "mode of being conscious." It is said to be common to desire, yearning, longing, craving, wishing, and willing; indeed, to all consciousnesses which have an inherent tendency to pass beyond themselves. On this definition conation is a self-determination of consciousness. In desire, e.g., consciousness endeavors to pass from the want of an object to its possession; or, if an unpleasantly toned idea enters consciousness—say the idea of an embarrassing situation—a conation arises, and consciousness makes a forcible effort to eject the unpleasant idea. These two views are not necessarily mutually exclusive, although they arise from two radically different methods of psychology. The first analyzes consciousness without regard to the offices of knowing and willing which mind fulfills, i.e., without reference to the relation of mind to the "outside" world; the second sets consciousness into relation with its objects, and seeks to discover the "behavior" of mind towards the world. Or, in other words, the first scrutinizes the "feeling of effort" or "endeavor" in an analytic way, and finds only sensations of strain and an affective quality; the second assumes that mind takes positive "attitudes" towards its objects—that it is not only a sequence of occurrences, but a self-determining cause, directing its own contents, an agent in much the same sense that friction is an agent in the production of electricity. Consult: Stout, *Analytic Psychology* (London, 1896); Titchener, *Text-Book of Psychology* (New York, 1910); *Experimental Psychology* (ib., 1901); James, *Principles of Psychology* (ib., 1890). See DESIRE; EFFORT; FATIGUE; WILL.

CON'ATY, THOMAS JAMES (1847–1915). An American Roman Catholic prelate. He was born in Ireland and was educated at Montreal College (1863–67), College of the Holy Cross (1869), and Montreal Theological School (1872). He was pastor of the Church of the Sacred Heart, in Worcester, Mass., in 1880–97 and in 1896 was appointed rector of the Catholic University, Washington, with the title of domestic prelate to the Pope (1897). In the autumn of 1901 he was made Bishop of Samos *in partibus*, still retaining his university position. In 1903 he was appointed to the see of Monterey and Los Angeles. In 1893 he organized the Catholic Summer School at Plattsburg, N. Y.

CON'CAN (Skt. *Kōnkana*), or **KONKAN.** A territory in the Presidency of Bombay (q.v.), British India (Map: India, B 5). It is a long strip of country, about 300 miles long by 40 miles broad, running south from the Damanganga River, between the coast of the Arabian Sea and the Western Ghats. Prior to 1818, when it was annexed by the British, it was a Mahratta principality. The modern districts of Thana (pop., 1891, 819,000; 1901, 809,000; 1911, 882,309) and Ratnagiri (pop., 1891, 1,106,000; 1901, 1,167,000; 1911, 1,203,638) are comprised in its area.

CON'CAVE (Lat. *concavus*, hollow, from *com-*, together + *cavus*, hollow; connected with Gk. *κύαρ*, *kyar*, hole, from *κύειν*, *kyein*, to conceive, to contain). A surface is said to be concave when its centre of curvature is towards the observer, convex when its centre of curvature is in the opposite direction to the observer. (See LENS, MIRROR.) In geometry a plane polygon is said to be concave if any side produced cuts the polygon. A spherical polygon is said to be concave if any side produced cuts the polygon so as to leave part on one hemisphere and part on the other. A solid is said to be concave if any face produced cuts the solid.

CONCEAL'MENT (from *conceal*, from OF. *conceler*, Lat. *concelare*, to hide, from *com-*, together + *celare*, to hide). As a legal term, the improper suppression or withholding of facts, the covering up of crimes, or the secretion of a person or property. The effect of the concealment of facts is dealt with under such titles as DECEIT; EQUITY; FRAUD; INSURANCE (qq.v.). As an element in criminal offenses, concealment has been considered in the articles on ACCESSORY; BIRTH, CONCEALMENT OF (qq.v.). The concealment of goods which are subject to revenue duty, or the secretion of property for the purpose of preventing its being taken in legal process, and the concealment of a debtor to avoid the service of summons on him, are the sub-

jects of statutory provisions, which should be consulted.

CON'CENTRA'TION CAMPS, or DISTRICTS. In the mobilization schemes of countries whose territories are contiguous, an important feature is of necessity the district within which the mobilized forces concentrate. In the *Field Service Regulations, United States Army, 1913,* a *Concentration Camp* is defined as a place, near the scene of intended operations or near an embarkation point, where troops are assembled for *immediate* use against the enemy or for transport to an oversea theatre of operations. A *mobilization camp* is a place where troops are assembled to be raised to war strength, equipped and prepared for service. (See MOBILIZATION.) The term "concentration camp" was used in a different sense in the Cuban insurrection (1896–98), during which the Spaniards concentrated all Cuban noncombatants within fixed limits; and similarly, in the British-Boer War of 1899–1902, the British collected the women and children of combatants in the field, as well as all noncombatant men, and established them in camps which were popularly known as concentration camps. In 1902 concentration camps were temporarily established by the American military authorities as an incident of the campaign in Mindanao, in the Philippines.

Another example of the concentration camps was found during the internal troubles in Mexico in 1914, when the national forces pursued by revolutionists crossed the Rio Grande and took refuge in the United States. The national soldiers, accompanied by women and children, were received by the United States military forces and collected in concentration camps, where they were disarmed, no opportunity being given for any belligerent action or return to Mexico for hostile purposes.

CONCENTRATION MARCHES. Marches of concentration are made for the purpose of assembling, at a certain time and place, bodies of troops from different localities. Such marches require an accurate computation of the time required for marching and of the road space occupied by the troops. The condition of the roads, weather, etc., must be considered. A column of troops on the march should not be cut by another. If the heads of two columns meet at a distance from the enemy, the senior commander has the right of way; if near the enemy, the senior determines what measures are to be taken. If a column in march overtakes another at a halt, it may pass on, provided its commander be the senior, or the other commander gives his consent. In either case the column which advances first is accompanied by its combat train; the field train waits for the other column with its combat train to pass, but precedes the field train of the latter column. Consult *Field Service Regulations, United States Army, 1913.*

CONCEPCIÓN, kôn-sĕp'sê-ōn' (Sp., conception). The capital of the province of the same name, Chile, situated on the Biobio River, 6 miles from its mouth (Map: Chile, C 11). The streets of the city are clean and paved. The chief buildings are the cathedral, the town hall, the agricultural school, and a normal school. Concepción is a bishopric. A railroad runs to Talcahuano, on the Bay of Concepción, the port of the city. The city is in a fertile district and has an active trade. Pop., 1907, 55,330. Concepción was founded in 1550, on the site of the present Penco, and built in its present situation in 1754, after the destruction of the former town in 1751 by an earthquake. During the Spanish occupation it was the second largest city of Chile. A disastrous earthquake occurred in 1835, after which the city was rebuilt on a more pretentious plan. In 1818 the independence of Chile was declared here.

CONCEPCIÓN, or VILLA CONCEPCIÓN. A city of Paraguay, capital of the department of the same name, on the Paraguay River, 125 miles north by east of Asunción (Map: Paraguay, F 8). Its chief industry is the export trade in *yerba maté,* or Paraguay tea. Pop., 1900, 15,000.

CONCEPCIÓN. A seaport town of Panay, Philippines, in the Province of Iloilo, capital of the District of Concepción, situated on the east coast of the island. It has a good harbor and large sugar manufactories. Pop., 1903, 4565.

CONCEPCIÓN. The largest town of Luzon, Philippines, in the Province of Tarlac, 12 miles south of Tarlac (Map: Luzon, D 5). It has an important sugar industry; rice, tobacco, and corn are also raised in the surrounding country. Pop., 1903, 12,593.

CONCEPCIÓN DEL URUGUAY, kôn-sĕp'sê-ōn' del o͞o'ro͞o-gwä'ê, or **CONCEPCIÓN.** A town in the Province of Entre Rios, Argentina, situated on the Uruguay River (Map: Argentina, F 10). It is the seat of a national college and a normal school. The town has transportation facilities by rail and water, the river being navigable for large vessels, and controls an important trade in cattle and packed meat. Pop., 1895, 6111. Concepción del Uruguay was founded in 1778, by Tomás Rocamora, and was formerly known as Arroyo de la China.

CON'CEPT (Lat. *conceptus,* thought, from *concipere,* to conceive, from *com-,* together + *capere,* to seize). In traditional formal logic a concept is an idea of a characteristic or characteristics belonging to more than one person or thing. Conception stands opposed to "simple apprehension," which deals with individuals singly. But traditional logic has proved unsatisfactory to many philosophers from the time of Kant (q.v.); hence they have taken the term "concept" and changed its meaning to correspond to their views of the function of thought. Thus Kant maintained that the understanding supplies to experience certain forms or principles of connection, such as causality; these he calls "pure concepts," designating the concepts of traditional logic "empirical concepts." For Hegel a concept is the unity which thought in its highest stage achieves, a unity in which contradictories are merged and harmonized. For the pragmatist a concept is a methodological device to which experience resorts when perplexed. "Feeling," says James, "must have been originally self-sufficing; and thought appears as a superadded function, adapting it to a wider environment than that of which brutes take account." Out of the "aboriginal sensible muchness attention carves its objects. We say *what* each part of the sensible continuum is, and all these abstracted whats are concepts." Consult Richter, *The Development of the Concept, Historic and Genetic* (Lancaster, Pa., 1908).

CONCEP'TION. See EMBRYOLOGY, HUMAN.

CONCEPTION, in Psychology. See IDEA.

CONCEPTION, IMMACULATE. See IMMACULATE CONCEPTION.

CONCEPTION OF OUR LADY, SISTERS OF THE. An order of nuns, founded in 1484, in honor of the Immaculate Conception, by Beatrix de Silva, sister of James, first Count of Portalegre, in Portugal. It was confirmed in 1489 by Pope Innocent VIII, who granted the sisterhood permission to follow the rule of the Cistercians; but after the death of the foundress, in 1489, Cardinal Ximenes put the nuns under the direction of the Franciscans and imposed on them the rule of St. Clara. The order subsequently spread into Italy, France, and Belgium. The habit consists of a white gown, a blue mantle, and a scapular on which is worn the image of the Virgin. The Franciscan Sisters of the Immaculate Conception in the United States were established by sisters from Italy in 1891 at Little Falls, Minn. They have two mother houses, conduct four hospitals, an orphanage, a school, and numbered (1913) 74 professed sisters and 13 novices.

CONCEP'TUALISM. A philosophical theory which is in some sense intermediate between mediæval realism and nominalism (qq.v.) and maintains that, while universals have no real existence in the external world, they do exist as ideas or concepts in the mind and are thus something more than mere words. This was Abélard's view. See ABSTRACTION; BERKELEY; LOGIC; IDEA.

CONCERT. (For derivation, see CONCERTO.) A public performance of musical compositions which do not require scenic representation. Before the last quarter of the seventeenth century concerts in the modern sense of the term were unknown. On special occasions musical performances took place at the courts of royalty and the palaces of the nobility, but no admission fee was charged and only invited guests attended. The only opportunity of hearing music performed was offered to the general public in the religious service and the production of oratorios in the churches. The first concerts to which an audience was admitted on payment of a fee were those established by John Banister in 1672 in London. After his death in 1679 Thomas Britton continued the practice. The establishment of the *Concerts spirituels* (q.v.) in Paris in 1725 marks a turning point in the history of the concert. After the model of the French institution numerous organizations devoting themselves to the performance of orchestral works sprang up in Germany, France, and England. Public performances of larger choral works with orchestra date from the foundation of the Berlin Singakademie (q.v.) in 1790. Regular concert tours by celebrated virtuosos were unknown before 1750. Consult: E. Hanslick, *Geschichte des Konzertwesens in Wien* (Vienna, 1869); K. F. Pohl, *Mozart und Haydn in London* (Vienna, 1867); A. Schering, *Geschichte des Instrumentalkonzerts bis auf die Gegenwart* (Leipzig, 1905).

CON'CERTAN'TE, *Ital. pron.* kōn'chĕr-tän'tā (It. p.p. of *concertare*, to perform a concert). An Italian word used to describe an orchestral composition in which two or more instruments or solo voices are in turn given prominent solo parts. See CONCERTO.

CONCERTINA, kōn'sĕr-tē'nȧ (from It. *concerto*, concert). An hexagonally shaped musical instrument, the sounds of which are produced by free, vibrating tongues of metal, as in the accordion. The scale of the concertina is very complete and extensive, beginning with the lowest note of the violin, g, and ascending chromatically, for three and a half octaves to c^4. There are two tongues for every tone, so that any note can be produced either by pulling the bellows open or by pressing them together. Wheatstone, of London, invented the concertina in 1829. The instrument is capable of a great range of expression, and concertina playing by skilled performers comes rightly under the head of artistic music.

CONCERT MASTER. The leader of the first violins in an orchestra. Through the ever-increasing demands made upon the technique of orchestral players by modern composers the position of concert master has become one of great importance and responsibility. The leader is not only responsible for uniformity of bowing from all the violins and occasional solo parts demanded by the score, but he is generally supposed to take the conductor's place in case of emergency. In large modern orchestras the player at the first desk of each of the groups of strings acts as a secondary concert master for his particular group.

CONCERTO, kōn-chĕr'tō (Fr. *concert*, from It. *concerto*, concert, from It., Lat. *concertare*, to vie, from *com-*, together + *certare*, to contend; less probably from *conserere*, to join together, from *com-*, together + *serere*, to join). A musical composition for a solo instrument, with orchestral accompaniment, calculated to exploit the resources or possibilities of the instrument and thus to give the performer an opportunity to display the highest technical skill (see CADENZA) as well as intellectual grasp and musical culture. The concerto belongs to the cyclical or sonata (q.v.) group of musical compositions and differs from a symphony or overture only through the special prominence given to the solo instrument. It consists, like the symphony or sonata, of three or four movements, each of which, like the whole, requires a clear development and treatment of motives and a strict adherence to the rules of form. The earliest concertos were written for two or more instruments, being thus really in concertante (q.v.) style. From the beginning of the eighteenth century the pianoforte and the violin have been the solo instruments mostly used for the concerto. Among the oldest violin concertos are those by Tartini and his pupils. The French and Germans afterward improved on these and fixed the forms, which all the great masters of modern times have adhered to. Occasionally concertos are also written for more than one solo instrument, but they do not differ in structure from the usual concerto. The two most famous examples are the triple concerto for piano, violin, and 'cello by Beethoven and the double concerto for violin and 'cello by Brahms. Consult A. Schering, *Geschichte des Instrumentalkonzerts bis auf die Gegenwart* (Leipzig, 1905).

CONCERTO GROSSO. An instrumental form originated by Corelli (q.v.) about the year 1680, employing generally three solo instruments (two violins and one violoncello), with accompaniment of the string orchestra. It really was the precursor of the modern *concerto* (q.v.). The solo instruments, however, were not treated so much individually, rather as a smaller group, complete in itself, against the larger instrumental body. The form was that of the older overture (q.v.) or suite (q.v.). When in the course of the eighteenth century the sonata form (q.v.) obtained a position of predominance among mu-

sical forms, the concerto grosso was gradually displaced by the concerto for one solo instrument with accompaniment of the full orchestra. The double and triple concertos differ from the older concerto grosso inasmuch as the solo instruments are no longer treated as a group, but as so many individual and distinct instruments intended to display the highest skill of the virtuoso. Consult A. Schering, *Geschichte des Instrumentalkonzerts bis auf die Gegenwart* (Leipzig, 1905).

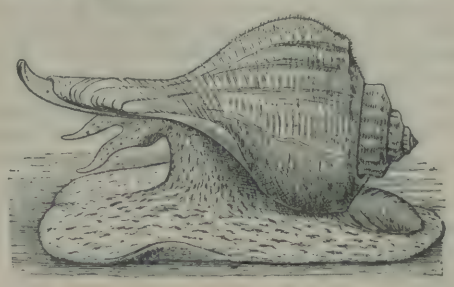
CONCERT PITCH. See PITCH.

CONCERTS DU CONSERVATOIRE, kôn'sâr' dụ kôn'sĕr'vä'twär'. The foremost concert institution of Paris, having grown out of the annual pupils' concerts of the conservatory. They were established as symphony concerts of the first rank by Habeneck in 1828. Originally six concerts were given, which gradually were increased to nine. Since 1866 two series are given, each programme being repeated on two successive Sunday afternoons. The orchestra consists of 84 players under Georges Marty (q.v.), who has been the conductor since 1901. Consult A. Dandelot, *La Société des Concerts du Conservatoire de 1828–1897* (Paris, 1897).

CONCERTS SPIRITUELS, spē'rē'tụ-ĕl'. The chief concert institution of France in the eighteenth century. As the opera and all theatres were closed on 24 religious holidays during the year, Philidor (q.v.) in 1725 instituted these concerts. For the first three years all operatic music and works by native French composers were excluded, but after 1728 every form of music by any composer was admitted, and the foremost artists of the time appeared at these concerts. Their reputation and success grew so steadily that they served as models for similar institutions in Germany. The Revolution put an end to these concerts in 1791. Under the old name, but with a different purpose, the concerts spirituels were resumed in 1805. Since then the programmes have been made up exclusively of sacred music and presented only during Holy Week. Consult M. Brenet, *Les concerts en France sous l'ancien régime* (Paris, 1900). See CONCERT.

CONCERTSTÜCK, kôn-tsĕrt'shtụk' (Ger. concert piece). A composition for a solo instrument with orchestra, really a concerto (q.v.) in one movement. While the first movement of a concerto generally is cast strictly in sonata form (q.v.), the concertstück is more free as to form, approaching the form of the fantasia (q.v.). The first movement of Schumann's beautiful concerto for piano and orchestra, op. 54, was originally written as a concertstück.

CONCH, kŏnk (Lat. *concha*, Gk. *κόγχη, konchē*, Skt. *śankha*, shell). The name of many large univalve mollusks. Originally and properly it belongs to the big carnivorous strombs and especially to the great rose-lined stromb (*Strombus gigas*) of the West Indies and Florida Reefs and especially abundant in the Bahamas. Shiploads of these shells are sent to Europe and the United States every year to be ground up for porcelain, burned into lime, calcined for medicinal purposes, or used as ornaments; many are perforated at the apex and serve as dinner horns on Southern plantations. Cameos of an inferior sort are cut in it; and from it are derived, especially in the Bahamas, pink "conch pearls" of value. It is because many of them made an occasional industry of gathering these mollusks and searching for pearls that the poorer sort of people of southern Florida and neighboring islands are called "Conchs." The Indians used the columella of this shell as material for fine beads; and their remains, as



A CONCH (*Sycotypus canaliculatus*).

The attitude is that of creeping towards the left. Beneath the protruding siphon tube two tentacles show the place of the head, the lower one showing the black dot of the eye. On the rear of the expanded foot is the operculum.

well as those of many other large mollusks, abound in the coastal shell heaps. In the East Indies the term is applied often to other large spiral shells, especially those of the closely allied family Tritonidæ. These are often perforated and fitted with mouthpiece and finger holes and so turned into sonorous musical instruments. This is the shell adopted by artists in representations of sea myths—

> "Have sight of Proteus rising from the sea,
> Or hear old Triton blow his wreathèd horn."

In the Northern States "conch" means either of two large, pear-shaped univalves of the Atlantic coast, *Fulgur carica* and *Sycotypus canaliculatus*, which frequent the sandy bottoms near shore and are cast up on beaches in great numbers. Both are carnivorous and do great damage to oyster beds. The former, which has a spiral row of short horns defining the whorls, is more common southward, while the latter, distinguished by the squarish channels between the whorls, is nearly confined to the region between Cape Cod and New Jersey. Both are abundant about Long Island and on the southern New England coast, where they are confused under the name "periwinkle" or "winkle." The "sea necklaces," consisting of parchmentlike hollow disks apparently strung upon a long cord, which attract attention on beaches in midsummer, are the egg cases of these mollusks, which have been torn from their attachment to some rock or seaweed and floated ashore. It was from the column of these shells that the Indians made their white wampum. Consult Ingersoll, "Natural History of Economic Mollusks of the United States," in *United States Fish Commission Bulletin for 1889*. See MOLLUSK and the authorities there cited.

CONCHITA, kôn-chē'tä. An opera by Zandonai (q.v.), first produced in Milan, Oct. 14, 1911; in the United States, Sept. 28, 1912 (San Francisco).

CONCHOID (kŏn'koid) (Gk. *κογχοειδής, konchoeidēs*, mussel-shaped, from *κογχή, konchē*, shell + *εἶδος, eidos*, form) **OF NIC'OME'DES.** A "shell-shaped" curve invented by Nicomedes (180 B.C.). It is related to the problems of trisecting an angle (see TRISECTION PROBLEM), of constructing two geometric means between two given straight lines, and of duplicating the

cube. The curve may be constructed by drawing a straight line *LM* for the directrix, and through any point *P* as the pole drawing a pencil of lines cutting *LM in* R_1, R_2, ... The conchoid is the locus of points found by laying off a constant length each way from R_1, R_2, . . . on these rays. This constant length is called the "modulus." The curve differs in general shape according as the modulus is equal to, greater than, or less than the distance of the fixed point from the fixed straight line. The figure shows the forms of the curve in the last two cases. The loop occurs when the modulus is greater

than the perpendicular distance from *P* to *LM*. When the modulus equals this distance, *P* is a cusp on the curve. The directrix *LM* is an asymptote to the two branches of the curve. If the foot of the perpendicular from the pole to the directrix is taken as the origin, and the distance is called *b*, and the modulus *a*, the equation of the conchoid is $(y + b)^2 (a^2 - y^2) - x^2y^2 = 0$. Its order is the fourth, and its class the sixth unless *P* is a cusp, in which case its class is the fifth. (See CURVE.) *P* is, in general, a double point, and the curve meets its asymptote at four consecutive points at infinity. The curve may easily be described mechanically, and is frequently used in architecture as a bounding line of the vertical section of columns. Consult Klein, *Vorträge über ausgewählte Fragen der Elementargeometrie* (Leipzig, 1895), trans. as *Famous Problems of Geometry* (Boston, 1897), and any work on analytic geometry.

CONCHOLOGY, kŏn-kŏl'ō-jĭ. See MOLLUSCA.

CONCHOS, kŏn'chōs, RIO (connected with Sp., Lat. *concha*, shell). A river in Mexico, in the State of Chihuahua, rising on the southern border of the east of the Sierra Madre, flowing in a northerly direction through the table-land of that region, and joining the Rio Grande del Norte at Presidio del Norte after a course of about 350 miles (Map: Mexico, G 3). It receives a number of confluents from the west, but no important tributary from the east.

CONCIERGE, kôn'syârzh' (Fr., doorkeeper). The French title of the janitor of an apartment house. He is an important functionary in the life of most French, German, and the largest Russian cities. He sits in his little office by the main entrance and exercises a certain supervision over all who pass in or out, opening the door to those who enter after a certain hour of the night (in Vienna as early as 10 o'clock).

CONCIERGERIE, kôn'syâr'zh'rē', LA. A Paris prison, famous as the place of confinement of political prisoners during the French Revolution. It forms a part of the Palais de Justice towards the river and was originally the residence of the concierge of the old palace. Among the famous prisoners confined in the Conciergerie and taken thence to the guillotine were Malesherbes, Madame Roland, Danton, Desmoulins, and Robespierre. Here Marie Antoinette was confined before her execution, in a small cell, afterward changed into a chapel. In 1840 Napoleon III was for a time an inmate of the prison.

CONCILIUM. See COMITIA.

CONCINI, kôn-chē'nê, CONCINO. A favorite of Marie de' Medici of France. See ANCRE.

CON'CLAVE (Fr., Sp., Portug., It., Lat., room which may be locked, from *com-*, together + *clavis*, key, Gk. *κλείς, kleis*, key, from *κλεῖν, klein*, to shut). Either the place where the cardinals assemble for the choice of a pope, or the assembly itself. In 1179 a Lateran Council decreed in its first canon that a two-thirds vote of the cardinals was essential for a choice. This decree was developed, and the regulations, which are substantially still in force, established by Gregory X at the Council of Lyons in 1274. These rules are intended to provide against unnecessary delay or precipitation in election and against any external interference with absolute freedom of choice. A part of the Vatican is devoted to this use and is divided into a number of small apartments. Only one door is open, and that is under the strict supervision of officials designated for the purpose. Since 1848 food is prepared in the conclave, and the cardinals are not allowed to leave the place, or to receive or send out letters, until a new pope is chosen. Though directive legislation has varied from time to time, the present form may be said to have been fixed in its essential features since the end of the thirteenth century. When a pope dies, the College of Cardinals possesses supreme authority. Cardinals only may vote, but non-cardinals are not excluded from candidature. All are sworn to secrecy. No voting by proxy is allowed. As to place, there is hardly any restriction. Formerly each cardinal in the name of the Catholic country which he represented had the right of excluding a candidate not acceptable to his government. This privilege he could exercise only once during the election. It it not possible to determine how old this concession was. Pius X prohibited, Jan. 20, 1904, under pain of excommunication, any elector to receive in any guise whatever a proposed veto against any possible nominee. The cardinals take an oath to this effect. A two-thirds vote is necessary to elect. Consult: any authorized manual on canon law; Wernz, *Jus Decret* (Rome, 1899); Thurston, "Conclaves, Past and Present," *Month*, vol. cii (London); *La Revue des Deux Mondes* (March 15, 1904). See POPE.

CONCOM'ITANCE (ML. *concomitancia*, from Lat. *concomitari*, to accompany, from *com-*, together + *comitari*, to accompany, from *comes*, companion), SACRAMENTAL. In the Roman Catholic church, a term which implies that the body and blood of Christ sacramentally accompany each other, so that under either form, whether wine or bread, both are sacramentally received. Hence the laity in that communion, although they are not permitted to take the cup, still are held to receive Christ's body and blood. See COMMUNION IN BOTH KINDS.

CONCOM'ITANT VARIATION, METHOD OF. See INDUCTION.

CONCONE, kôn-kō'nâ, GIUSEPPE (1810–61), An Italian vocal teacher, born in Turin. He is widely known for his vocal exercises—solfeggi

and vocalizzi—which are unusually attractive for works of their kind and at the same time excellent for their special purpose. For about 10 years Concone resided in Paris as a teacher. Returning to Turin in 1848, he was at the time of his death organist and choir master of the court choir.

CONCORD, kŏn'kērd. A town in Middlesex Co., Mass., 20 miles by rail northwest of Boston; on the Concord and Sudbury rivers, and on the Boston and Maine Railroad (Map: Massachusetts, E 3). It has manufactures of rubber goods, chairs, woolens, and harness. The town contains the Massachusetts Reformatory, a fine public library, the old North Bridge, and many other places of historic interest. The government is administered by town meetings, and the municipality owns and operates its water works and electric light plant. Pop., 1900, 5652; 1910, 6421.

Concord, settled in 1635, is the oldest interior town in Massachusetts and by the time of the Revolution had come to be one of the great centres, not only of intellectual life, but also of political influence and power. In August, 1774, the Middlesex Convention, the first county convention assembled in Massachusetts, was held here, every town being represented; and on October 11, under the stimulus of the Revolutionary agitation, the first Provincial Congress, presided over by John Hancock, met at Concord to consider the question of resisting the tyrannies of George III. Later large quantities of ammunition and military supplies were stored here, and in an attempt made by the British to destroy them, on April 19, 1775, occurred the memorable fight which precipitated the War of the Revolution. (See LEXINGTON.) In 1787, during Shays's Rebellion, a body of insurgents entered Concord and prevented the sitting of its courts. The town is chiefly notable for having been the home of a distinguished coterie of writers and thinkers, including Emerson, Thoreau, A. Bronson Alcott, Louisa M. Alcott, Hawthorne, and William Ellery Channing, "the poet." Consult Hurd, *History of Middlesex County* (Philadelphia, 1890), and Emerson, *Historical Discourse Delivered in 1835* (Concord, 1835).

CONCORD. A city, capital of New Hampshire, and the county seat of Merrimack County, 75 miles by rail north-northwest of Boston; on the Merrimac River and on the Boston and Maine Railroad (Map: New Hampshire, G 7). It has wide streets, shaded and well paved, and a good water supply, owned and operated by the municipality. Among the principal buildings are the State House, built of granite, United States Government building, courthouse, and city hall, State prison, State Hospital for the Insane, the Margaret Pillsbury Hospital, Odd Fellows' Home, State Historical Society, Home for the Aged, Orphans' Home, State library, and St. Paul's School (Episcopal) for boys. There are several parks: White's, Rollins, Fiske, Contoocook River, and Penacook. In the State-House park are statues of Daniel Webster, John Stark, and John P. Hale, and at Penacook a monument to Hannah Dustin. In the vicinity are extensive quarries of fine-grained white granite, the quarrying of which is one of the leading industries. The car shops of the Boston and Maine Railroad are situated here. The manufactures include carriages, silverware, harness, furniture, flour, cotton and woolen goods, leather belting and leather hose, pianos, shoes, etc. Under the charter of 1909 Concord is governed by a mayor, chosen every two years, six aldermen at large, elected for four years, three assessors, and nine ward aldermen, chosen for two years. The mayor and aldermen at large constitute a board of public works, which has extensive powers. The police and fire departments, each with a chief, are controlled by the board of aldermen. The water works are managed by a board appointed by the mayor. The school board is chosen by popular election. Pop., 1900, 19,632; 1910, 21,497; 1920, 22,167.

Concord was founded in 1725, on the site of Penacook, the chief village of the Penacook Indians, and bore that name until 1733, when it was incorporated as Rumford. It suffered greatly in all the Indian wars and was the scene of a massacre in 1746. In 1765 Rumford was renamed "Concord." On the adoption of a State constitution it became the capital of New Hampshire and in 1853 was incorporated as a city. Consult: Moore, *Annals of Concord, N. H.* (Concord, 1824); Bouton, *The History of Concord* (ib., 1856); City History Commissions, *History of Concord* (ib., 1903).

CONCORD. A city and the county seat of Cabarrus Co., N. C., 21 miles northeast of Charlotte, on the Southern Railroad (Map: North Carolina, B 2). It is the seat of the Jackson Training School and the Scotia Seminary. There are foundries and machine shops, and extensive manufactures of cotton. First incorporated in 1793, Concord is governed at present under a charter of 1851, revised in 1891, which provides for a mayor, elected biennially, and a city council. The water works and electric light plant are owned by the city. Pop., 1890, 4339; 1900, 7910; 1910, 8715.

CON'CORD, IN MUSIC. See CONSONANCE.

CONCORD, BOOK OF (trans. of Ger. *Concordienbuch*, Lat. *Liber Concordiæ*). A collection of confessions of faith published in 1580, generally accepted by the Lutheran church. Its contents are: (A) The three ecumenical creeds—the Apostles', the Nicene, and the Athanasian. (B) The six particular confessions of the Lutheran church—(1) the Augsburg Confession; (2) the Apology of the Augsburg Confession; (3) the Schmalkald Articles; (4 and 5) the Larger and Smaller Catechisms of Luther; (6) the Formula of Concord. The last-named division, the Formula of Concord, appeared in 1580, after protracted conferences, and was acceded to by 86 of the states of the German Empire, but rejected by some of the states and by Bremen and Frankfort among the free cities. Its topics are: The Rule of Faith and the Creed; Original Sin; Free Will; Justification; Good Works; The Law and the Gospel; The Third Use of the Law; The Lord's Supper; The Person of Christ; The Descent of Christ into Hell; The Customs of the Church; Predestination and Election; and an appendix concerning heresies and sectaries. The best editions are: in German, Jubilee edition (St. Louis, 1880); in Latin, that of S. F. Francke (Leipzig, 1847); in English, that of H. E. Jacobs (Philadelphia, 1882). Consult Schaff, *Creeds of Christendom*, vols. i and iii (New York, 1878); Curtis, *History of Creeds and Confessions* (Edinburgh, 1911).

CONCORD, TEMPLE OF (so called). A Doric temple at Girgenti, the ancient Agrigentum, in Sicily, and one of the most perfectly preserved of ancient temples. Its 34 columns are still standing.

CONCOR'DANCE (ML. *concordantia*, agreement, from Lat. *concordere*, to agree, from *com-*, together + *cor*, heart). A book arranged in alphabetical order and showing in what passages all, or at least all of the more important, words in any work occur. For writings of universal import from which passages are continually being adduced to prove or support principles affecting our daily life and action, such a handbook is indispensable. The necessity for such a book upon the Bible was doubtless early felt, but tradition assigns the first Bible concordance to the famous St. Anthony of Padua (q.v.). It was entitled *Concordantiæ Morales in Sacra Biblia* (best ed., De la Haye, Paris, 1641), and was published early in the thirteenth century. In 1244 Cardinal Hugo de Saint-Cher published his *Concordantiæ Jacobi*, so called because made in the convent of St. James in Paris. Both these works were of course based on the Vulgate, as were several similar ones before the invention of printing. The earliest printed concordance to the Vulgate is by Joannes de Segovia and Sebastian Brant (Basel, 1496), and it is the basis of that published and edited by Robert Stephens (Paris, 1555). A concordance to the Greek Bible (Old and New Testament) was made by Euthalius of Rhodes about 1300; it has never been printed, but a manuscript copy was seen in Rome in the seventeenth century. One to the Septuagint was compiled by Conrad Kircher (Frankfort, 1607), and to the Greek New Testament by Xystus Betuleius (Basel, 1546), which, as amended by Robert Stephens and his son Henry, was published by the latter (Paris, 1594). Rabbi Isaac Nathan finished in 1448 a concordance to the Hebrew Bible (Venice, 1523), which in amended form by Marius de Calaris was published (Rome, 1621–22); another was begun by the elder and finished by the younger Johann Buxtorf (Basel, 1632). The first work of this kind in English was a concordance to the New Testament printed and in all probability prepared by Thomas Gibson (London, 1535); but the first concordance to the entire English Bible was by John Marbeck (London, 1550). Luther's German Bible had to wait till 1610 before a concordance to it appeared at Frankfort. The author was Conrad Agricola.

But all these works are now superseded by the vastly better modern works. For the Hebrew Bible the standard concordance is that by Julius Fürst and Franz Delitzsch, in Latin (Leipzig, 1837–41); but just as good for all practical purposes will be found *The Englishman's Concordance to the Hebrew Old Testament* (London, 1843; 4th ed., 1873), compiled by Tregelles, B. Davidson, and others. For the Septuagint, the best is by Hatch and Redpath (London, 1892–97); for the Vulgate, two recent works are by V. Coornaert (Bruges, 1892), and by Peultier, Etienne, and Gantois (Paris, 1902). To the Greek New Testament the best concordance in Latin is by C. H. Bruder (Leipzig, 1842; 5th ed., Göttingen, 1900); in English by W. F. Moulton and A. S. Geden (London and New York, 1897). To Luther's Bible the standard is M. G. Büchner's (Jena, 1740; 23d ed., Berlin, 1899). To the Authorized Version of the English Bible Alexander Cruden was the first to prepare a concordance which met with wide acceptance (London, 1737), and it has been reprinted so often, complete or in condensation, that Cruden has become a household word. Three others, however, are excellent—Robert Young, *Analytical Concordance to the Bible* (Edinburgh, 1879), often reprinted, Walker, *Comprehensive Concordance* (Boston, 1894), and James Strong, *The Exhaustive Concordance* (New York, 1894), which takes account of every word and is surely the most ambitious work of its kind.

Other books than the Bible have been furnished with concordances by the patient and long-continued labors of scholars. To enumerate a few: *Dante*, E. A. Fay (Boston, 1889); *Omar Khayyam* (Fitzgerald's), J. R. Futtin (London, 1899); *Chaucer*, the Chaucer Society (begun London, 1872); *Shakespeare*, Mrs. Mary Cowden Clarke (London, 1845), or, better, John Bartlett (New York, 1894); Milton, *Poetical Works*, G. L. Prendergast (Madras, 1857); C. D. Cleveland (London, 1867); *Pope*, E. Abbott (ib., 1875); Cowper, *Poetical Works*, J. Neve (ib., 1887); *Gray*, Albert S. Cook (ib., 1909); *Burns*, J. R. Reid (Glasgow, 1889); *Wordsworth*, Lane Cooper (London, 1911); *Shelley*, F. S. Ellis, (ib., 1892); *Dickens*, G. A. Pierce (ib., 1898), and M. Williams (ib., 1907); *Tennyson*, D. R. Brightwell (ib., 1869), and A. E. Baker (Taunton, 1911); *Browning* (*a Phrase Book*), Marie A. Molineux (New York, 1896).

CONCOR'DAT (Fr., agreement). A term used to designate a compact dealing with ecclesiastical affairs between the Pope, as head of the Roman Catholic church, and the temporal ruler of a state. Concordats commonly relate to things which are neither purely spiritual nor purely temporal, but mixed matters, in regard to which the action of the two powers can with difficulty be dissociated. Concordats may be framed either in the form of a treaty, to which both the contracting powers are consenting parties, or enacted by proclamation issued only by one party, most commonly by the Pope, embodying in the form of a decree the regulations resulting from the terms of agreement previously arrived at. The difference is only in form. It is a settled doctrine of Roman Catholic canonists, and especially of those of the Ultramontane (q.v.) school, that the Pope never absolutely cedes purely spiritual powers. Thus, in the presentation to bishoprics, while the King "nominated" or "elected," the Pope always reserved to himself the power of "canonical institution." There have been many famous concordats, of which the following are the most important: 1. *Concordats with Germany.*—The well-known Concordat of Worms in 1122, respecting investitures, is commonly regarded as the first concordat strictly so called. Similar agreements took place on the question of the *Regalia* (q.v.), between the Roman see and the emperors Otho IV, Frederick II, and Rudolph of Hapsburg. A more comprehensive compact on Church matters is that of which the foundation was laid at Constance in 1418, and which was subsequently modified by the "Frankfort" or "Princes' Concordat," by the Concordat of Aschaffenburg, and by that of Vienna, which last, although practically disregarded by Joseph II and his successor, Leopold II, continued in use till the dissolution of the Holy Roman Empire in 1806. Its place was supplied, under Pius VII and his immediate successors, by separate concordats with Bavaria, 1817; Prussia, 1821; Baden, Württemberg, and other minor states, 1818; Hanover, 1824; and Saxony, 1827. The last German concordat was that concluded at Vienna, Aug. 18, 1855. This provided for the fullest papal authority in the Austrian domin-

ions. The Church was to control education and to exercise a censorship over the press. The ecclesiastical courts were accorded special privileges. The Emperor was to nominate bishops, but only with the advice of the existing bishops and archbishops. The Church might acquire new property, but once acquired, it could not be sold or mortgaged without the consent of both Pope and Emperor. This concordat, so favorable to the papacy, was set aside in 1868 in all the dominions of the Emperor of Austria. 2. *With France.*—The Pragmatic Sanction, ascribed to St. Louis, but really of later date, has some of the characteristics of a concordat; but the first proper concordat is that of Bologna, concluded by Francis I with Leo X in 1515 and 1516, which continued in force, although with more than one conflict of the two powers, till the Revolution. In reëstablishing the Church in France, Napoleon Bonaparte, as First Consul, concluded with Pius VII the celebrated Concordat of 1801, which he afterward compelled the Pope, then a captive at Fontainebleau, to modify by a new act in 1814. Both were ignored at the Restoration; but an attempt to produce a substitute in 1817, and again in 1819, led to no result. 3. *With Italy.*—In Italy an agreement regulating the election of bishops was concluded with Nice and Savoy by Nicholas V in 1415; and a formal concordat was made with Sardinia by Benedict XIV in 1740. The ecclesiastical affairs of Naples were anciently regulated by the terms of what was called the *Monarchia Sicula;* but a formal concordat was made by Pius VII in 1818. 4. *With Spain.*—Charles I concluded a concordat for his Spanish kingdom with Adrian VI and Clement VII; and a further concordat was made by Clement XII and Philip V in 1737. 5. *With Portugal.*—Benedict XIV made a concordat with Portugal in 1741 and again in 1886. Besides these, the papacy has from time to time made many similar concordats with various small powers, especially with South American states in the nineteenth century. The age of concordats has passed away with the establishment of the preponderance of the state over the church, and for the most part concordats have been abrogated, such as that with France and with Austria. But several of the concordats still remain in force, as, e.g., that with Spain and with Bavaria.

Consult: Séché, *Les origines du Concordat* (Paris, 1894); Cardinal Cavagnis, *Institutiones Juris Publici Ecclesiastici* (Rome, 1906). The texts of the various concordats will be found in the collections of Münch (Leipzig, 1830); Nussi (Mainz, 1870); Walter (Bonn, 1862); Balve (Munich, 1863); often with extensive commentaries. See AUSTRIA-HUNGARY; CONSTANCE, COUNCIL OF; GERMANY; HOLY ROMAN EMPIRE; INVESTITURE; NAPOLEON I; PIUS VII.

CONCORDE, kôn'kôrd', PLACE DE LA (Fr., Square of Concord). The largest square in Paris, the starting point of the Champs Elysées, bounded by the Rue de Rivoli, the Tuileries Gardens, and the Seine. It is associated with many historical occurrences. On it, on May 30, 1770, occurred a panic caused by fireworks, resulting in the death or injury of over 3000 persons. On the spot now occupied by the obelisk stood the guillotine by which more than 2800 persons died between Jan. 21, 1793, and May 3, 1795. In 1871 the Versailles troops engaged in a fierce struggle with the Communists on the square. The present name of the place, previously the Place Louis XV, was given in 1799. It was again called Place Louis XV from 1824 to 1830, when the name now in use was restored. Architecturally the square is one of the finest in the world. It is adorned with an obelisk from Luxor, presented by Mehemet Ali in 1831, with striking fountains, and eight figures representing the principal towns of France, and at night is brilliantly illuminated by 20 large bronze clustres of lamps. It commands a fine view of the Champs Élysées with the Arc de Triomphe, of the Madeleine, and of the Chambre des Députés, approached by the Pont de la Concorde.

CONCORDIA, kôn-kôr'dê-â. A river port in the Province of Entre Rios, Argentina, situated on the right bank of the Uruguay (Map: Argentina, F 10). It has oil mills and slaughterhouses and exports large quantities of salt meat, leather, and Paraguay tea. Pop., 1895, 12,694.

CONCORDIA, kôn-kôr'dĭ-â. A city and the county seat of Cloud Co., Kans., 202 miles west-northwest of Kansas City, on the Missouri Pacific, the Union Pacific, the Atchison, Topeka, and Santa Fe, and the Chicago, Burlington, and Quincy railroads, and on the Republican River (Map: Kansas, E 3). The city contains Nazareth Academy, St. Aloysius' School, St. Joseph's Hospital, and a Carnegie library. Concordia has abundant water power, is in a fertile agricultural country, and has valuable deposits of coal and building stone. There are grain elevators, flouring mills, a cold storage and ice plant, creameries, produce-packing plants, plow and wagon works, brick and cement-block plants, etc. The water works are owned by the municipality. Pop., 1910, 4415.

CONCORDIA (Lat., from *con-*, together + *cor*, heart). A Roman divinity, the goddess of harmony. Many temples were built in her honor, the oldest of them by Camillus in 367 B.C., after the passing of the Licinian Laws. (See AGRARIAN LAW.) It stood in the Forum between the Temple of Saturn and the Mamertine Prison, at the foot of the Capitoline Hill, and was built of white marble with a richly carved cornice. Within the temple were many masterpieces of Greek sculpture. It contained, besides, paintings and a collection of precious stones. It was twice rebuilt, in 121 B.C. and under Augustus, but only scanty ruins now remain. The temple sometimes served as a meeting place for the Senate, and Cicero there delivered his last oration against Catiline. The goddess was represented as a matron, holding in her right hand a saucerlike vessel (*patera*) or an olive branch, and in her left the horn of plenty. Her symbols were two hands clasped together, and two serpents entwined about a wand. On the worship of such abstract conception as deities, consult Fowler, *Roman Festivals* (London, 1899). For the temple, consult Hülsen-Carter, *The Roman Forum* (Rome, 1906).

CONCRES'CENCE (Lat. *concrescentia*, growing together, from *concrescere*, to grow together, from *com-*, together + *crescere*, to grow; connected with Lat. *creare*, to create). The growing together of young plant organs by reason of mutual contact or pressure when forming. The term has also been applied to the apparent union of neighboring organs, such as the flower parts. In these cases, however, each organ begins its development independently, and those which appear to be united are lifted by the growth, underneath the separate rudiments, of a

region of tissue which belongs equally to all. See TERATOLOGY; FLOWER.

CONCRETE'. An artificial stone made of gravel, broken stone, or other inert material, sand, and cement, which when mixed with water soon set into a hard, dense mass. It is of very remote origin, specimens having been found in the earliest structures. In ancient Rome it attained a high degree of use, particularly in the walls of buildings, many of which are now in existence. While fundamentally any cementitious material may be used in its manufacture, the term is now exclusively applied to the artificial stone in which the binder is a hydraulic cement, i.e., one that will set under water. (See CEMENT.) Its particular advantages are its cheapness and availability as compared to stone masonry and the ease with which it may be cast into any shape or form, due to its plastic nature during manufacture. Of late years its use has greatly increased because of the invention of reinforced concrete, i.e., concrete in which steel is imbedded to supplement certain strength deficiencies in the concrete itself. In the year 1913, in the United States alone, over 80,000,000 barrels of cement were used in the manufacture of concrete.

As it closely approximates the natural stone in appearance and strength, and as it is much cheaper than any but the cheaper grades of stone, concrete is used in all classes of masonry structures, such as foundations, dams, walls, arch bridges, breakwaters, piers, pavements, reservoirs, locks, docks, etc. In under-water work it is much more widely used than natural stone because of the much greater ease in placing. Reinforced concrete can be made into much lighter forms of construction and is thus available for practically all classes of work in which timber, stone, or structural steel is used.

Constituents. The component parts of concrete are water, cement, and stone of varying size, the latter known as the *aggregate* and divided into fine and coarse aggregate. Since the comparatively recent development of Portland cement, it has been practically exclusively used for concrete, natural cement being used only in mortars and in concrete where strength or quality is not the prime requirement. In Europe and in rare instances in the United States a pozzuolanic cement is sometimes used for special work. Portland cement is now manufactured under a universally adopted specification and is of a uniformly high grade. It is invariably tested at the mill, but it is the custom for the purchaser to make his own tests on all large and important work. It is delivered to the work in cloth or paper sacks holding 0.95 cubic feet (98 pounds), more rarely nowadays in barrels holding 3.8 cubic feet (391 pounds), or still more rarely in bulk in car-load lots. The fine aggregate is generally a natural sand, though sometimes a crushed stone, reduced to sand size, is used. Sand must be clean and free from impurities and should pass certain tests as to its fitness for concrete material. The coarse aggregate may be any inert material, but is generally crushed rock or gravel, although broken brick, shards, cinders, and slag have been successfully used. It must be as hard, dense, and stable as possible and should break into round rather than flat pieces. The water must be clean and free from impurities.

The strength of concrete depends largely on its density, and that in turn depends upon the gradation of the sizes of the various elements that make it up. A theoretically perfect concrete is one in which the cement completely surrounds the sand, making a mortar which completely fills the voids in the stone. This ideal condition results when there is such a gradation in sizes that all the voids in one class of material are filled with the particles of the next smaller material. The sizes of the particles of the various elements follows: cement, less than 0.005 inch; sand, ⅛–¼ inch; stone, ¾–3 inches. In one class of concrete, known as rubble or cyclopean concrete, large stones, even up to derrick size, are used. These are only for heavy mass work and are dumped into the wet concrete before it is set, care being taken that each stone has at least a 1-inch coating of mortar.

In high-class work great effort is made to analyze and grade the aggregate so that the ideal progression of sizes is achieved, but in general practice the best that can be done is to select as well-graded material as is commercially possible and then to proportion the material to give the densest concrete. These proportions vary from one part cement, one part sand, and two parts stone, all by volume (known as a 1 : 1 : 2 mixture), to one part cement, three parts sand, and seven parts stone (a 1 : 3 : 7 mixture), the strength increasing with the amount of cement. The most generally used mixes are a 1 : 2 : 4 for reinforced-concrete work and a 1 : 3 : 5 for mass concrete. The amount of water to be used varies with the material, the temperature, and the humidity, but is generally from 16 to 25 per cent by volume. A greater proportion is sometimes used to make easier working, but it tends to reduce the initial strength of the concrete.

Manufacture. The manufacture of concrete is generally a field operation, though sometimes separate units are shop cast, as noted below. It is mixed wet and placed in the forms which give it its desired shape; after it sets into a hard stone, the forms are removed. Formerly only hand mixing was the rule, the various ingredients being thrown on a board and turned and mixed by spading until they were thoroughly combined. Now the machine mixer is almost universal, and hand mixing is resorted to only in small work.

Machine mixers are power-driven devices which turn and stir the ingredients until they may be delivered in a thoroughly mixed condition. They are of two general types, the continuous mixer and the batch mixer. The former takes the sand, cement, and stone, with water, at one end and delivers the concrete from the other end in a continuous stream. Their general design is a trough in which a screw paddle works the material together and through the trough. The batch mixer, as its name implies, takes a definite amount of the materials and mixes and delivers the concrete batch before taking another batch. Its general type is a drum (cubical, doubly conical, or cylindrical), mounted on a horizontal axle on which it revolves. It is provided with interior baffles or blades which assist the mixing process. A third type of mixer, which has recently come into the market, mixes the concrete by the force of compressed air in an air-tight drum into which the ingredients are placed.

Placing. The concrete is taken from the mixer and placed in the work by wheelbarrows,

3. A REINFORCED-CONCRETE GIRDER BRIDGE. Woodland Bridge, Watseka, Ill.

locomotive-drawn cars, derricks and buckets, cableways and buckets, chutes or belt conveyors, the particular method depending upon the size of the work and the local conditions. In underwater work it is placed through long tubes, called "tremies," which reach from above the water to the place where the concrete is being laid, or by bottom-dumping buckets, which are not opened until the concrete is reached. It cannot be deposited through open water because the various ingredients would separate before reaching the proposed place of deposition.

Forms. One of the most important features of concrete work is the design and construction of the molds, technically called "forms," in which the concrete is laid. These must be of the proper shape and size to give the required finish, must be strong enough to withstand the hydraulic pressure of the wet concrete, and finally must be so arranged as to be easily taken down and used, for the sake of economy, in other work. Generally they are of wood, but in extensive work steel forms are sometimes used.

Strength. Concrete, like natural stone, is very strong in compression and weak in tension, so that, unaided by any other material, it is of value only to carry direct loads. Its strength, then, is measured by its compression resistance. This resistance increases with the proportion of cement in the mixture and with the age of the concrete. When first made, concrete is a semiliquid mass of no strength, and it reaches an initial set in the course of a few hours and a definite resistive quality in about 24 hours. Thereafter its usual increase in strength is in the following ratio, assuming a 100 per cent strength in 2 years: 7 days, 50 per cent; 1 month, 67 per cent; 6 months, 90 per cent; 1 year, 98 per cent; 2 years, 100 per cent. Some tests have been made over longer periods than two years, and although they are not conclusive as to further increase in strength, it is generally assumed that there is no retrogression after that period. The accompanying tables give some average values for the compression strength of different mixtures of good concrete for one month and six months:

COMPRESSIVE STRENGTH OF CONCRETE IN POUNDS PER SQUARE INCH

MIXTURE	AGE	
	30 days	6 mo.
1:1½:3	2500	3800
1:2 :4	2000	3000
1:2½:5	1800	2600
1:3 :6	1600	2400
1:4 :8	1100	1700

The strength of concrete varies also with the kind of materials used, poor cements, weak stone, dirty sand, and impure water materially reducing its resistive quality. The set is always retarded by freezing; below 40° F. the setting is very slow, but proceeds until freezing, when the setting process practically ceases. A concrete which is frozen before setting will resume the setting process after thawing out. In order to avoid trouble in winter work good practice demands that the water and aggregate be thoroughly heated before being placed in the forms and, in extremely low temperature, the inside of the forms be artificially heated until the concrete has set. By taking such precautions concrete has been successfully laid in temperatures as low as 30° F. below zero.

Reinforced Concrete. Reinforced concrete (known in Europe as concrete steel, armored concrete, béton ferré, béton armé, etc.) is concrete in which steel has been placed to supplement the strength deficiencies of the concrete. Its initial use was about 1860, but it is only since about 1900 that it has been generally employed. Now it is one of the most popular structural materials.

The action of the reinforcing steel in reinforced concrete may be explained by the accompanying

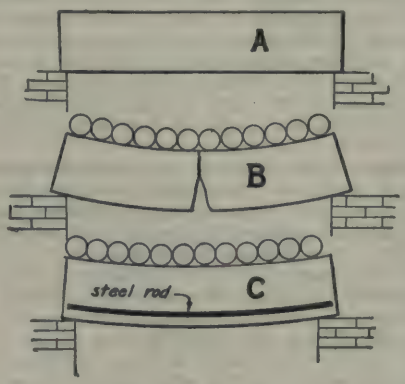

diagram. In this *A* represents a beam; when loaded, this beam will deflect downward in proportion to the load, and if it be of concrete, the concrete on the lower plane of the beam will crack in tension, under a very low load, as shown at *B*, and the beam will fail. If, however, a steel bar be placed, as shown at *C*, the steel, which is very strong in tension, will take the pulling force in the bottom of the beam, which will bend slightly under the same load as in *B*, but will not crack or break.

By virtue of the judicious combination of these two materials reinforced concrete can be used for the same purposes and in the same general disposition of members as can steel or wood, materials which are equally strong in tension and compression. At the same time the reinforced concrete possesses superior qualities of wear and longevity and is often much cheaper. In consequence it is being rapidly adopted for all structural purposes, such as for buildings, bridges, dams, wharves, docks, pipes, etc.

Normally it is built in the field. Forms, of wood or steel, outlining the shapes of the finished elements of the structure are first erected, and in them are placed the steel rods, so disposed as to take up the tensile stresses, and then the concrete is poured around the steel in the forms. After it has set, the forms are taken down and there is left a monolithic structure of concrete members reinforced with steel rods, which in good design should be tied together at every connection to insure the monolithic character. In a special type of reinforced-concrete construction the various members of the structure are cast as separately molded members in a casting yard and, after having set hard, are erected and tied together with concrete and steel joints, in a somewhat similar manner to the erection of timber and steel structures.

Concrete Blocks. Another very common application of concrete is the concrete block. This

is generally small, say 8 × 8 × 16 inches, with openings running vertically to reduce the weight, save material, and provide interior air space, which is cast of a sand and cement mortar in specially made machines. It is used largely in minor building operations, being set up in the wall with mortar joints. Its advantages are the ease and cheapness with which it can be made and the usual easy accessibility of the materials which make it up. Poor manufacture and materials very easily degrade the quality of the block, and as they are generally made by small operators on a small scale, they are very apt to prove weak and dangerous. When properly made, however, they are most satisfactory.

For some classes of heavy construction, such as dams, breakwaters, dock, etc., concrete is cast in a yard in large blocks of derrick size and set in place as in stone-masonry practice. These are not called "concrete blocks," that term being reserved for the small hollow building block noted above.

Wear. Since concrete is a field-made product subject to the lax workmanship and untoward conditions that that implies, and since its ingredients all necessarily require the closest inspection, it is not invariable in quality. When well made and of proper constituents, it is an admirable building material; it is highly fire and weather resisting, water-tight, and of long life. So far as the records show there is no limit to the continuance of these qualities in a good concrete. On the other hand, there is a great deal of poor concrete made, and this is subject to the attack of all kinds of deteriorating influences which bring about its gradual decay. The only safeguard is competent supervision of the making of the concrete.

Surface Finish. The texture of the face of concrete is in part affected by the nature of the form against which it is cast, but normally concrete has a dead, mouse-colored surface which requires some further treatment in any exposed work. This treatment may be the use of specially selected aggregate which is worked to the surface during laying, the tooling of the hardened surface as in stone masonry, or the scrubbing of the surface with brick or a wire brush to bring out the aggregate. At considerable expense various natural building stones may be faithfully imitated in concrete by some one of these methods.

CONCRETE, REËNFORCED. See CONCRETE.

CONCRETE TERM. In logic, any name, whether substantive or adjectival, which denotes a thing and connotes a quality. See CONNOTATION; DENOTATION.

CONCRE'TION (Lat. *concretio*, coalescence, from *concrescere*, to grow together). A term used in medicine to denote a formation of solid, unorganized masses within the body, either by chemical precipitation from the secretions, or by the accidental aggregation of solids introduced into the system from without. If composed of precipitates in the urinary bladder, gall bladder, or salivary ducts, concretions are called calculi. (See CALCULUS.) They may also be found in former cavities in the lungs, as well as in tubercular joints, in which cases they are composed of lime salts. They may be found in the fingers and toes of gouty patients, appearing in nodules projecting from the sides of the joints, and termed tophi, or crabs' eyes. These nodules are frequently composed of urate of sodium. Concretions composed of fecal matter are frequently found in the vermiform appendix, in cases of appendicitis; very rarely a fruit seed is the basis and centre of such a concretion. Concretions have been formed upon pieces of catheter in the urinary bladder and upon beans in the nostrils. Concretions formed of balls of hair, concretions of Epsom salts swallowed undissolved, and concretions of cholesterin (q.v.) have been found in the intestines. See BEZOAR.

CONCRE'TIONARY STRUCTURE. A method of aggregation observed in some rock masses, particularly in the finer-grained sediments like chalk, limestone, and clay, whereby certain constituents have been collected together to form rounded symmetrical bodies that may closely simulate the work of human hands. They are variable in size and shape, but usually take the form of balls, disks, ovate and botryoidal masses which range from an inch or less to several feet in diameter. In any one rock their substance is likely to be uniform. The most common materials that form concretions are calcium carbonate, clay ironstone, and silica. The flints found in the chalk formations of England and France are an example of siliceous concretions, as are also the chert nodules found in many limestones, e.g., the corniferous limestone of New York State. Lime concretions are illustrated by the smooth, rounded, and sometimes perforate objects that accompany recent clays, which are not infrequently taken for fossils, so striking is their resemblance to organic forms. Clay ironstone occurs abundantly in concretions in association with the coal measures from which it may be mined as a valuable iron ore. The nodules of that material not infrequently show a system of radiating cracks which have been filled by a deposit of calcium carbonate, forming a network of white veinlets that inclose rounded or polygonal areas of the black iron carbonate. Such masses are called septaria (q.v.); when cut and polished, they exhibit a mosaic pattern which is quite ornamental.

The origin of such nodules and concretions is regarded by most geologists as referable to processes acting subsequently to the formation of the stratum in which they occur; i.e., they were not primarily incorporated in the sediments, but have been built up layer after layer in place. The agency is probably water—the body of ground water that is constantly circulating through the rocks and carrying on the work of solution and precipitation of mineral materials. In most cases the deposition began about some nucleus of foreign matter, like a grain of quartz, a fossil plant, or shell. The principle involved in such selective precipitation has never been satisfactorily explained, but it bears some analogy to the force of crystallization. According to Dr. George P. Merrill, the formation of clay nodules may result from purely mechanical processes, of which he cites an instance that came under his observation. In that case, however, the materials were of the same kind as

those forming the sediment, whereas in true concretionary structure they are usually of contrasting character to their immediate surroundings. Another type of concretionary structure is exemplified by oölite (q.v.).

CONCU'BINAGE (from OF., Fr. *concubine*, from Lat. *concubina*, concubine, from *concumbere*, to lie with, from *com*, together + *cubare*, to lie). In general, the cohabitation as husband and wife of a man and woman who are not lawfully married to each other. Specifically, a form of polygamy in which the primary matrimonial relation is supplemented by one or more secondary and inferior relations of the same kind. It was used, technically, in the former sense, in the common-law action for dower, in the allegation that the woman claiming dower was not a wife lawfully married to the party in whose land she seeks to be endowed, but his concubine. In the United States the term has been applied, under the Edmunds acts of 1882 and 1887, to the polygamous relations of the Mormons, at which the acts were aimed. In its general sense, as denoting merely unlawful cohabitation, concubinage, however abhorrent to the moral sense of the community, is not in most jurisdictions obnoxious to the criminal law. In its special sense, however, as signifying a plurality of wives, it comes under the penalties of bigamy and polygamy (qq.v.).

The earliest Roman laws were distinguished for the strictness with which they treated marriage. They not only upheld thoroughly the principle of monogamy, but they fettered marriage itself with many burdensome forms. Hence arose the practice of a free unmarried man entering into a less strict relation with a single woman—a sort of permanent cohabitation. The offspring of such a connection, called "natural" children, had not the rights of legitimate children, but they were recognized by the father. Augustus, with a view to promote regular marriages and check the growing licentiousness, enacted a comprehensive marriage law (*Lex Julia*), which discouraged concubinage, restricting it to women of low rank or those who had lost their station. Christianity required the complete sanctity of marriage and taught that concubinage was sinful, and we find the Synod of Toledo legislating against it as far back as 400 A.D. The ancient laws of the Germans recognized, along with regular marriage, an informal connection of the sexes. In the Middle Ages a similar connection became customary, called a left-handed, or morganatic marriage. See MARRIAGE, and consult the authorities there referred to. See HETÆRÆ.

CONCUR'RENCE (ML. *concurrentia*, concurrence, from *concurrere*, to run together, from *com-*, together + *currere*, to run) and **COL'LINEAR'ITY** (from Lat. *com-*, together + *linea*, line). If several lines have a point in common, they are said to be concurrent. The common point is called the vertex of the pencil of lines. If several points lie on one straight line, they are said to be collinear. The line is called the base of the range of points. That portion of geometry concerned with concurrent lines and collinear points is called the theory of concurrence and collinearity. Some of its fundamental propositions are:

If a transversal intersects the sides of a triangle ABC in the points X, Y, Z, the segments of the sides of the triangle are connected by the relation $(AZ : ZB) \cdot (BX : XC) \cdot (CY : YA) = -1$. Conversely, if the points are so taken that the relation holds, then the three points are collinear. (This relation is known as Menelaus' theorem.)

If the three lines AO, BO, CO drawn from the vertices of the triangle ABC are concurrent in O and meet the opposite sides in X, Y, Z, it follows that $BX \cdot CY \cdot AZ = -CX \cdot AY \cdot BZ$, and conversely (Ceva's theorem).

If three lines perpendicular to the sides of a triangle ABC at X, Y, Z are concurrent, then $BX^2 - XC^2 + CY^2 - YA^2 + AZ^2 - ZB^2 = 0$. Conversely, if this relation holds, the perpendiculars are concurrent.

If the lines joining the vertices of two triangles are concurrent, their corresponding sides intersect in three collinear points. (This proposition, known as Desargues's theorem, is true for any rectilinear figures.)

The opposite pairs of sides of a hexagon inscribed in a conic intersect in three collinear points (Pascal's theorem).

The lines joining the opposite vertices of a hexagon circumscribed about a conic are concurrent (Brianchon's theorem).

The polars of a range of points with respect to a circle (q.v.) are concurrent, and conversely.

If from any point on a circle perpendiculars are drawn to the sides of an inscribed triangle, the feet of these perpendiculars are collinear. (The base of this range is called Simson's line.)

From these and other similar theorems many properties of elementary geometry follow at once; as, the altitudes of a triangle are concurrent, the medians of a triangle are concurrent, etc. The theorems of Pascal and Brianchon lead to numerous theorems in modern geometry. Consult: Cremona, *Elements of Projective Geometry*, trans. by Leudesdorf (Oxford, 1885); Casey, *Sequel to Euclid* (Dublin, 1888); McClelland, *Geometry of the Circle* (New York, 1891); Veblen and Young, *Projective Geometry* (Boston, 1911).

CONCURRENT JURISDICTION. The jurisdiction that exists where two or more courts possess the equal and coördinate right of taking cognizance of a single cause. Thus, in the United States, a justice's court and a city court may often take cognizance of the same matter; or a court of common pleas and a superior court may do the same. In criminal cases it is an established rule that, when one court has brought an offender before it, the court having concurrent jurisdiction is thereby debarred from taking cognizance of the case. In civil trials it is the privilege of the person appealing to the law—i.e., in most cases, the plaintiff—to choose before which of the two coördinate courts he wishes to bring the matter. The phrase "concurrent jurisdiction" is used in opposition to *privative*, or exclusive, jurisdiction, i.e., where only one court has the right of hearing and determining the matter at issue.

In the political system of the United States, with its Federal courts exercising jurisdiction over the same persons as are subject to a local State jurisdiction, the occurrence of cases of concurrent jurisdiction is very common. Where it exists, a decision of a State court may, in a proper case, be taken up to the Supreme Court of the United States for review. See COURT; JURISDICTION.

CONCUSSION OF THE BRAIN (Lat. *concussio*, shock, from *concutere*, to shake together,

from *com-*, together + *quatere*, to shake). The name given to a group of symptoms which result from injuries to the head, but are not due to fracture or to perceptible laceration of vessels or brain substance. The condition has been widely discussed and extensively studied by many means of experimentation, but authorities still disagree as to whether it is due to laceration of minute blood vessels, to molecular changes in the brain cells, or to a change in the disposition of the cerebrospinal fluid. Surgeons deny that concussion of itself is fatal, and autopsies show almost invariably some apparent lesion of vessels or brain substance in those fatal cases which have simulated concussion, but which were really instances of contusion or laceration. The symptoms vary in mild and severe cases. In the former, when the patient is "stunned" by a fall or a blow on the head, there are dizziness, disturbances of vision and noises in the ears, loss of strength, so that the patient falls, the face is pale and covered with a cold perspiration, the respiration is shallow, the pulse feeble and often slower than normal. In graver cases these symptoms become intensified, or the most extreme symptoms may develop instantly. There is complete unconsciousness, the body is cold and relaxed, the pupils widely dilated and unresponsive to light, the respiration scarcely distinguishable, the pulse weak, irregular, and slow. Vomiting is also frequent. This condition may last for several hours or even for a day or more, after which reaction slowly occurs, and recovery is complete. Frequently the symptoms of contusion or hemorrhage may follow, and the subsequent history becomes that of severe brain injury. Protracted symptoms of concussion are usually regarded as suggestive of a more serious injury. The treatment is expectant; it consists in the application of warmth to the body, stimulation of respiration and pulse if necessary, and in keeping the patient in absolute quiet. A surgical operation is, of course, not indicated in pure concussion, but only in such cases as give symptoms of gross brain lesions. See SHOCK.

CONDAMINE, CHARLES MARIA DE LA. See LA CONDAMINE.

CONDÉ, kôn'dā', FAMILY OF. One of the great families in France, and a branch of the house of Bourbon. It took its name from the town of Condé. (See CONDÉ-SUR-L'ESCAUT.) The first to bear the title of Prince de Condé was Louis, the youngest son of Charles de Bourbon, Duke of Vendôme. (See below.) The family became extinct in 1830. It gave many famous men to France, of whom the following are the most noted:

LOUIS I DE BOURBON, Prince de Condé (1530–69), appears in 1549 as gentleman of the royal bedchamber. He distinguished himself at the siege of Metz (1552), and in the battle of Saint-Quentin (1557). But the court was under Guise influence, and no Bourbon could expect advancement. Condé, who had early imbibed Protestant ideas, threw in his lot with the Huguenots on the accession of Francis II in 1559. He took part in the conspiracy of Amboise, formed by the Huguenots for the overthrow of the Guises. The capture and imprisonment of the chief Huguenot leaders followed, and Condé escaped execution only through the opportune death of the King. The balance of power rested in the hands of Catherine de' Medici (q.v.), who liberated Condé and made him Governor of Picardy. After the Massacre of Vassy (1562) Condé and Coligny took up arms against the Guise faction, but they were defeated at Dreux in the same year, and Condé was taken prisoner. He was, however, liberated in the year following by the pacification of Amboise. Owing to fresh persecution, the Huguenots again took up arms in 1567; an unsuccessful attempt to seize the person of the King was followed by the indecisive battle of Saint-Dénis, in which the Catholic leader, the Constable de Montmorency, was slain, and in 1568 another treaty of peace was made. Condé, however, learning of court intrigues against his liberty, renewed the conflict. The battle of Jarnac (March 13, 1569) resulted most disastrously for the Huguenots. Condé rashly exposed himself and was wounded and taken prisoner. While his wounds were being dressed, he was assassinated by Montesquieu, a Swiss mercenary captain, possibly at the command of the Duke of Anjou, whom Condé had offended. "He was distinguished," says the Duc d'Aumale, "by great ardor and gayety, the desire and the gift of being pleasant, by a resolute character, a proud soul, and a great and generous heart." Of the four sons who survived him, the eldest, Henri I (1552–88), joined the Huguenot cause, but renounced his religion to save his life at the time of the Massacre of St. Bartholomew. He again took up arms for Protestantism in 1585 and was excommunicated by Pope Sixtus V. After several successful encounters with the forces of the League, Condé was wounded at Coutras (Oct. 20, 1587) and died a few months later, not without grave suspicions of foul play on the part of his wife and attendants. The legitimacy of his only son, Henri II (1588–1646), was a matter of great dispute; but finally he was allowed to succeed to the titles and estates of his father, and, for a time at least, was looked on as the heir presumptive to the French crown. This contingency was removed by Henry IV's second marriage and the birth of the Dauphin Louis (1601). After a life at court, devoted to the aggrandizement of his family and marked by opposition to the Huguenots, Henri II de Condé died in 1646. He was the father of the Great Condé.

LOUIS II DE BOURBON (1621–86) is known in history as the Great Condé. After a thorough education in the Jesuit seminary at Bruges the young Prince, who was known as the Duc d'Enghien during the lifetime of his father, was introduced at court, and the next year, at the age of 18, was made Governor of Burgundy. To further his father's political aims, he was forced, in 1641, to marry the niece of Richelieu, much against his inclination. Meanwhile he had entered the military service and distinguished himself in the Netherlands, but his great triumph came in 1643, when, at the battle of Rocroi, he outmanœuvred the Spanish infantry, raised the siege, and inflicted a severe defeat on the enemy. Other successes followed, and Condé was promoted and sent to Alsace, in the summer of 1643, to coöperate with Turenne. After the victory of Freiburg, the capture of Philippsburg, Mainz, and other cities on the Rhine, Condé returned in triumph to Paris for the winter, but in 1645, after the defeat of Turenne by Mercy, he again took the field and by his splendid dash and energy won a series of victories culminating in that of Nördlingen in 1645, where Mercy was killed. Associated with the Duke of Orléans in

the Netherlands in 1646, Condé won several brilliant victories. The death of his father in the same year made him head of the Condé family, gave him possession of vast estates and a large fortune, and made him the highest personage in the state after the King and the Duke of Orléans. Though feared by Mazarin, Condé was given the chief command in the Netherlands and made captain general of the French forces. The victory at Lens in 1648 added to his fame, and he was recalled to Paris to suppress the rising of the Fronde (q.v.). After many intrigues, plots, and counterplots the court returned to Paris. Condé's haughtiness of manner and dictatorial measures, however, soon alienated the Queen and nobles, and by the advice of Mazarin he was arrested, with other members of his family. The threatened advance of Turenne, the murmurs of the Fronde, and the activity of friends soon secured Condé's release. The discomfiture and flight of Mazarin again brought Condé to the front, but the failure of the court to fulfill its promises and the suspicions he entertained that his assassination was contemplated roused him to fresh rebellion in 1651. His former ally, Turenne, was now on the side of the court, and after Condé had won the battle of Bléneau (April, 1652) and advanced on Paris, he was met by Turenne at the head of the royal troops. A bloody and indecisive conflict ensued, the net result of which was so to weaken the Frondeurs that most of them consented to a treaty of peace. Condé, however, rejected the proffered terms, and after a vain effort to retrieve his cause and seize Paris, went over to Spain. In the war which followed he acted as commander in chief of the Spanish forces in Flanders, but, despite his brilliant strategy, could gain no advantage over Turenne, who opposed him, and he was finally badly defeated in the battle of the Dunes (June 14, 1658) by the allied French and English forces. When the Peace of the Pyrenees was made (1659), Condé was pardoned and again entered the service of France. In 1673 he commanded in the Netherlands and the next year fought a drawn battle at Seneffe with William of Orange. This was the great general's last important battle, though in 1675 he succeeded Turenne, on the latter's death, in command of the army on the Rhine. Disabled by gout, he resigned his post and retired to his estate at Chantilly. There he devoted himself to religious exercises varied by the pursuit of literature and the society of his friends. He was intimate with Molière, Racine, Boileau, Bossuet, and La Bruyère. He died at Fontainebleau on Dec. 11, 1686, and his friend Bossuet pronounced the now famous *Oraison funèbre* over his bier. Though proud, and acting always from motives of selfish ambition, Condé was without doubt one of the greatest men of his time. The only surviving son of the Great Condé, Henri Jules (1643–1709), inherited some of the ability of his father, while his grandson, the Duke de Bourbon, known as *Monsieur le Duc*, was a prominent figure at the time of the Regency.

Louis Joseph de Bourbon, Prince de Condé (1736–1818), the son of the Duke de Bourbon, was born in Paris, Aug. 9, 1736. He distinguished himself in the Seven Years' War. At the outbreak of the Revolution he showed himself a strong supporter of the monarchy, and in 1792 took up arms against the Republic, organizing on the Rhone a body of *émigrés*, which coöperated with the Austrians and was known as "the army of Condé." After the Peace of Campo Formio (1797), he entered the Russian service and in 1801 fought in that of England. His last years were spent at Chantilly. He was the author (1798) of an *Essai sur la vie du grand Condé*. His son Louis Henri Joseph (1756–1830) was the last of the Condé princes. He was wounded at the siege of Gibraltar in 1782 and later served under his father against France. His eldest son was the hapless Duc d'Enghien (q.v.), executed in 1804 by order of Napoleon. After the Restoration, Condé settled his fortune on the Duc d'Aumale, son of Louis Philippe, but in 1830 seemed to have thought of changing this will. Before doing so, however, he was found strangled, and it was judicially decided that he had committed suicide.

Consult: Duc d'Aumale, *Histoire des princes de Condé XVIe and XVIIe siècles* (7 vols., Paris, 1863–96); vols. i and ii translated into English by R. B. Borthwick (London, 1872); Lord Mahon, *Life of Louis, Prince of Condé* (ib., 1845); Fitzpatrick, *The Great Condé and the Period of the Fronde* (2d ed., ib., 1874); Crétineau Joly, *Histoire des trois derniers princes de la maison de Condé* (Paris, 1866); Muret, *L'Histoire de l'armée de Condé* (ib., 1844); Piépape, *Histoire des princes de Condé au XVIIIe siècle* (ib., 1911); Williams, *The Love Affairs of the Condés* (London, 1912).

CONDELL, kŭn'dĕl, Henry (?–1627), and **HEMING,** John (?–1630). English actors, whose names are forever linked with Shakespeare's. They both belonged to Shakespeare's company, and, with Burbage, were joint owners of the Globe Theatre. The great dramatist, as a token of lifelong friendship, bequeathed to them and Burbage 26s. 8d. to buy rings. And they in turn collected and edited his plays, "to keepe the memory of so worthy a friend and fellow alive" (first folio, 1623).

CONDEMNATION. See Eminent Domain.

CONDENSED MILK. See Milk.

CONDENS'ER (from Lat. *condensare*, to thicken, from *com-*, together + *densus*, thick, Gk. *δασύς*, *dasys*, thick). Any device for reducing gas or vapor to a liquid or solid form. The name is applied specifically to a variety of apparatus used in the arts besides appliances for condensing gases and vapors, as the part of a cotton gin which compresses the lint; a machine which takes the wool coming from the carding engine and rolls it into slightly twisted threads or slubbings ready for spinning; the arrangement of steam pipes used in sugar mills to evaporate the water in the cane juice preparatory to concentration. Condensers in steam engineering are apparatus for condensing the exhaust steam from an engine. They are invariably employed on ocean-going steam vessels and generally on coasting, river and fresh-water steamers, often in stationary power plants and seldom or never on locomotives or portable engines. The two distinct forms are the surface condenser and the jet condenser. The surface condenser consists essentially of a closed vessel containing a nest of tubes through which a current of cold water is passed and around which the exhaust steam circulates, thus keeping the condensed water separate from the cooling water, which is frequently salt or dirty. In the jet condenser the exhaust steam flows into an air-tight chamber, where it meets a spray of cool water which condenses it, and the condensed water and cooling or

injection water combined are then pumped out. This form of condenser is frequently used where a supply of fresh water is available for cooling purposes or where a very limited quantity of water of any kind is available and the cooling or circulating water is to be used over again. A modification of the jet condenser, known as the barometric or siphon condenser, is now used extensively. The condensing vessel is placed at the top of a pipe over 32 feet in height, whose lower end is immersed in water so that it forms the tube of a water barometer. The exhaust steam flows into the tube containing this water column at the top, meeting there the spray or injection of cooling water which condenses it. Gravity tends to empty the water in the vessel, because the combined waters then drop down the pipe and become part of the water column, some of which flows out at the lower end. Hence a Torricellian vacuum is maintained at the top of the column except so far as the vapor of water is present, and entrained air. A dry-air pump is used with this apparatus to take away the air that comes to the condenser with the steam and collects at the top of the barometric column. See STEAM ENGINE.

CONDENSER. A form of electrical apparatus used to accumulate a charge of electricity. A condenser in its simplest form consists of two conductors which are separated from each other by an insulating medium or dielectric. The name dates from the time of the fluid theory of electricity, when it was believed that a certain amount of the electric fluid could be collected or condensed on a conducting surface. The principle of the apparatus is illustrated in the Franklin plate, which consists of a plate of glass with pieces of tin foil on each side. If a positively charged body or the positive conductor of an electric machine is connected with one of the tinfoil coatings, it will communicate to it by conduction a positive charge of electricity. If now the opposite plate is connected with the ground, the negative electricity is held bound, while the positive is repelled and passes to the ground. Accordingly we have accumulated equal amounts of positive and negative electricity on the tin foil, and if the two surfaces are connected a bright spark results and the equilibrium is restored. Otherwise the charge remains on the surface of the conductors until it is dissipated by leakage. The energy which is stored up in the condenser is expended in producing the spark. The amount of electricity that can be accumulated depends upon the capacity of the condenser and the potential of the charge. The Leyden jar consists of a Franklin plate in a cylindrical form, and as it is more compact and has greater capacity, it is more often used. In practice, however, the usual form of condenser consists of sheets of tin foil separated from each other by paraffined paper, or in the case of standard condensers sheets of mica, with the alternate sheets of tin foil connected together to give considerable capacity. The apparatus may be arranged so as to afford various amounts of capacity, and is much used in cable testing and other branches of electrical work. The unit of capacity is the farad (q.v.), but condensers are generally constructed to give capacities in fractions or multiples of a microfarad ($\frac{1}{1000000}$ farad), which is the unit ordinarily employed. See ELECTRICITY.

CONDER, CLAUDE REIGNIER (1848–1910). An English army officer and writer on the topography and archæology of Palestine. He was educated at University College, London, and entered the Royal Engineers. In 1872–78 and 1881–82 he commanded the survey of Palestine. He afterward served in Egypt (1882), in Bechuanaland (1884–85), on the Transvaal Border as British Commissioner, at the headquarters of the Ordnance Survey (1887–94), in Irish relief work (1895), and on the Irish Ordnance Survey (1900–05). He contributed to Smith's *Bible Dictionary.* Among his important works are: *Tent Work in Palestine* (1878); *Judas Maccabæus* (1883); *Heth and Moab* (1883); *Memoirs of the Palestine Survey* (1883, 1890); *Primer of Bible Geography* (1884); *Palestine* (1891); a translation of the Tel el-Amarna tablets (1894); *The Latin Kingdom of Jerusalem* (1897); *The Hittites and their Language* (1898); *The Rise of Man* (1908); *The City of Jerusalem* (1909). He published in 1869 a series of illustrations for Bunyan's *Pilgrim's Progress* and made illustrations as well as maps and charts for his own books.

CONDER, JOSIAH (1852–). An Anglo-Japanese architect, born in London. He was educated at the Kensington Art Schools, in the Slade life classes of University College, and at the Royal Institute of British Architects. In 1876 he was engaged by the Japanese government as professor of architecture to the Imperial Japanese Engineering College of Tokyo, and as architect in the Public Works Department. He was also lecturer on architecture at the Imperial Tokyo University. In 1884 he received the fourth-class decoration of the Rising Sun and in 1894 the third-class decoration of the Sacred Treasure. Finally he was retired with a life pension and with the office of honorary consulting architect to the Imperial Japanese government. His publications include: *Landscape Gardening in Japan* (1893); *The Floral Art in Japan* (1899); *Paintings and Studies by Kawanabe Kyosai* (1911).

CONDÉ-SUR-L'ESCAUT, kôn'dā' sụr lĕs'kō' (Fr., Condé on the Scheldt, from Gall. *condat,* confluence + Fr. *sur,* on + *Escaut,* Scheldt). A town in the Department of Nord, France, at the confluence of the Haine and the Scheldt, 8 miles northeast of Valenciennes, of which it is the entry port (Map: France, N., J 2). It dates from the Roman period and gave its name to the noble family of Condé. It has an interesting castle, a church, an arsenal, and strong fortifications constructed by Vauban. It has belonged to France since 1678. It manufactures starch, chicory, leather, soap, and boats. Pop. (commune), 1901, 4960; 1911, 5213.

CONDÉ-SUR-NOIREAU, nwä'rō'. A town in the Department of Calvados, France, on the Noireau and Drouance rivers, 33 miles south-southwest of Caen by rail (Map: France, N., E 4). Among its notable features are the two venerable churches of St. Sauveur and St. Mark, and a bronze statue of Dumont d'Urville, the famous navigator, a native of the town. It is a busy industrial centre, with cotton-spinning factories, manufactures of cutlery, leather, thread, cotton and linen fabrics, oils, and ironworking, and an important trade in cattle, honey, and other agricultural products. Pop., 1901, 6591; 1911, 5604.

CONDILLAC, kôn'dē'yăk', ETIENNE BONNOT DE (1715–80). A French philosopher. He was born at Grenoble and in 1768 became a member of the French Academy of Sciences. He never

attended the meetings of the Academy after his reception as a member and passed his life mostly in great retirement. He died at his estate near Beaugency. In 1746 he published his *Essai sur l'origine des connaissances humaines*, a work which represented the views of Locke (q.v.). In his later works he carried out the sensational side of Locke's philosophy with great consistency. He believed that "the ego of each man is only the bundle of the sensations he experiences and of those which memory recalls." He later, in his *Traité des sensations*, illustrated his view by describing an imaginary consciousness, possessed by a marble statue, growing as it receives one by one various sense faculties. In addition to his first essay, he wrote: *Traité des systèmes* (1749); *Recherche sur l'origine des idées que nous avons de la beauté* (1749); *Traité des sensations* (1754); *Traité des animaux* (1755); *La logique* (1781), besides 13 volumes of textbooks he had prepared when tutor to the Duke of Parma, grandson of Louis XV. Several editions of his collected works have been published (1798, 1803, 1822). Consult: Dewaule, *Condillac et la psychologie anglaise contemporaine* (Paris, 1892); Lewes, *History of Philosophy* (London, 1880); Réthoré, *Condillac ou l'empirisme et le rationalisme* (Paris, 1864); Robert, *Les théories logiques de Condillac* (ib., 1869).

CON'DIMENTS (Lat. *condimentum*, from *condire*, to season, from *com-*, together + *-dere*, Skt. *dhā*, to put). Seasoning agents, or substances employed at table for the purpose of imparting a flavor or seasoning to the ordinary solid or liquid food. The greater part of condiments are necessary to sustain the proper functions of the alimentary system and, besides gratifying the appetite, minister to the wants of the structure. The principal condiments are saline substances, such as common salt; acidulcus bodies, such as acetic acid or vinegar; oily condiments, such as butter and olive oil; saccharine substances, such as sugar and honey; and aromatic and pungent condiments, such as mustard, ginger, pepper, and pickles.

CONDI'TION (OF. *condicion*, Fr. *condition*, from Lat. *condicio*, agreement, from *condicere*, to agree, from *com-*, together + *dicere*, to say). The popular name in American college parlance for a deficiency on the part of a student in examinations. It derives its force from the fact that the student is permitted to go on with his class only on *condition* that the deficiency be made good within a given time, failing which his name is dropped from the college rolls.

CONDITION. In natural science and metaphysics, that in default of which a phenomenon does not occur. (See CAUSALITY.) In logic it denotes any qualification of the universal validity of a statement. See LOGIC.

CONDITION and **CONDITIONAL.** As a legal term, "condition" signifies a provision in a contract, conveyance, grant, or will, that an estate or interest in property, or a personal obligation, shall depend upon the happening of an uncertain event. The term is also applied to the event itself. If the condition is set forth in words, it is called an *express* condition; if it is inferable from the circumstances of the particular case, it is called an *implied* condition. In English law conditions are also classified as conditions *precedent* and conditions *subsequent*. An example of the former is the grant of an estate to A upon condition that he marry B; or the contract to charter a ship upon condition that it is in the port of Amsterdam. Here the event named must happen before the estate vests in A, or the contract obligation on the part of the hirer of the ship arises. An example of a condition subsequent is the grant of an estate to A upon condition that he continues to reside in a particular place; or the purchase of a piano upon condition that it shall "stand up to correct pitch" for a year. Here the estate in A, or the obligation of the purchaser to keep and pay for the piano, is annulled upon the nonperformance of the condition. Impossible, illegal, or repugnant conditions are void. Accordingly, says Blackstone, "if they be conditions subsequent, the estate shall become absolute in the tenant, for he hath by the grant the estate vested in him, which shall not be defeated by a void condition. But if the condition be precedent, he shall take nothing by the grant, for he hath no estate until the condition is performed."

A provision in a contract which is intended to operate as a condition in favor of one party may contain a binding promise of the other party. For example, A agrees to sell and deliver to B at a named time, place, and price a certain quantity of merchantable corn; and A tenders unmerchantable corn at the agreed time, place, and price. B has the right not only to reject the corn, because the condition precedent to deliver merchantable corn has not been performed by A, but also to recover from A damages for breach of contract to deliver the agreed corn. Such a provision in a contract may be called a promissory condition. Of this class are the mutual promises of the seller to deliver the goods and of the buyer to pay for them—engagements which are sometimes called "concurrent conditions." Promissory conditions have been confused with warranties (see WARRANTY) by many judges and writers, but the English Sale of Goods Act of 1893 makes a sharp distinction between the terms and has done much to clear up the confusion in this branch of the law. See SALE.

Another and distinct class of provisions in contracts may be styled *casual* or *contingent* conditions, because they are intended to prevent any obligation attaching to either party until their performance. An example of this class is afforded by an agreement for the sale of described goods to arrive by a specified ship. Here, if the ship does not arrive, or, if arriving, it has not the described goods on board, neither party is bound.

The word *conditional* frequently appears in standard legal phrases, some of the more important of which are the following: *Conditional acceptance* (of a bill of exchange) is an acceptance in which payment by the acceptor is dependent upon the fulfillment of a condition therein named; *conditional advance note* is a note given by the master of a ship to a seaman, payable after the ship sails upon condition that the seaman goes with the ship; *conditional allotment, conditional application*, is the allotment of shares in a company, or the application for shares, made upon a specified condition. In the former case the applicant is not bound to take the shares unless he has assented to the condition, nor in the latter case unless the condition is performed. Consult: Blackstone, *Commentaries on the Laws of England;* Benjamin, *Treatise on the Law of Sale*

of Personal Property (7th ed., Boston, 1899); Burdick, *Law of Sale of Personal Property* (2d ed., Boston, 1901).

CONDITIONAL FEE. At common law, an estate granted to a man and the heirs of his body. This limitation to a particular line of heirs, to the exclusion of collateral lines, was interpreted by the courts merely as a condition diverting the estate in the event that no issue was born answering the description of the grant, and the fee thus came to be known as a conditional fee. The condition being performed by the birth of issue, such estates became absolute and might then be alienated to strangers and the expectations of the issue defeated. As conditional fees were a device of the great landowners to preserve their estates intact for their lineal descendants, they procured the enactment of a statute by Parliament forbidding such alienation and preserving the interests of the issue as well as of persons to whom the property was to go on failure of issue. This was the famous statute of Westminster II (1285), known as the Statute *De Donis Conditionalibus* ('concerning conditional gifts'), which had the effect of converting such estates into fees tail and of preventing the evils at which it was aimed until, by the ingenuity of the lawyers and judges, other means were devised for barring entails and alienating such estates. See CONDITION; COMMON RECOVERY; FEE TAIL; FEE SIMPLE; FINE. Consult the authorities referred to under FEE SIMPLE and FEE TAIL.

CONDITIONAL IMMORTALITY. The doctrine advanced by certain theologians that the immortality of the soul is conditional only upon faith in Christ and that immortality is not inherent in the race. See ANNIHILATIONISM.

CONDITIONAL LIMITATION. A fee-simple estate limited or qualified (*a*) so as to come to an end on the happening of a collateral event, or (*b*) so as to shift from one owner to another on such an event. The expression "conditional limitation" is used in both these senses by different law writers of great authority, and it is therefore impossible to affix to it a precise definition. The first use of the phrase identifies it with the limited or qualified fee simple; as a gift of land to A and his heirs so long as they shall continue to live on the premises, or so long as St. Paul's Church shall stand, or until the happening of any other event. Under the early common law the donor of such an estate had an interest left—notwithstanding the estate conveyed was a fee simple—known as a "possibility of reverter," and, upon the happening of the event specified in the deed, the property would revert or return to the donor or his heirs. This contingent interest remaining in the donor of a qualified fee has been referred to the feudal relation of lord and tenant, which might subsist between the grantor and grantee of a fee, and it has been supposed that the Statute *Quia Emptores* (1290), which did away with this feudal relation, thereby destroyed also the grantor's possibility of reverter and converted every qualified fee into an absolute fee. But it has been held, nevertheless, in several States, including New York and Massachusetts, that qualified fees of this type are still good, and that they will revert to the grantor and his heirs on the happening of the event on which they were conditioned, and these decisions are likely to be followed in other States. But neither at the common law nor today has the grantor of such a fee any interest which he is capable of alienating to any other person prior to the return of the estate to him.

The second meaning of the expression "conditional limitation" makes it a convenient phrase for the commoner terms "executory devise" and "shifting use." While at the common law a gift of a fee simple, even though qualified as above described, was supposed to exhaust the whole power of alienation, if not the entire interest, of the donor, leaving him no capacity to give the property over, on the happening of a future contingency, to another; yet, as a result of the Statute of Uses (passed in 1527) and the Statute of Wills (enacted in 1532), it became possible to make a fee which should, upon a specified future event, shift to another. Thus, if land be devised by will to X and his heirs on condition that they shall forever maintain their citizenship in New York, with the further proviso that in the event of a failure to comply with the condition within the lives of the donor's children the property should go over to a charity, the last-mentioned gift might take effect as an executory devise, or conditional limitation on the prior gift. Such limitations on fees are now very common and may, under modern statutes, usually be effected by a simple deed of grant, without invoking the aid of the Statute of Uses. See DEVISE; ESTATE; FEE SIMPLE; FEUDAL SYSTEM; SUBINFEUDATION; USE; WILL; and the authorities referred to under those titles.

CONDOM, kôn'dôn'. A town in the Department of Gers, France, on the river Baise, here crossed by two bridges, 25 miles north-northwest of Auch (Map: France, S., E 5). The town, founded in 721 (Condomus), is irregularly built, but has handsome suburbs. It has a fine Gothic cathedral of St. Pierre (1506–21), adjoined by the remains of an old cloister, now used as a municipal building. There is a very considerable trade in grain, flour, wine, sawmill products, paints, drugs, and especially in Armagnac brandy, and manufactures of cotton, and cotton yarn. Bossuet was at one time Bishop of Condom. Pop., 1901, 6578; 1911, 6380. Consult U. Chevalier, *Répertoire des sources topobibliographiques* (Montbéliard, 1894–99).

CONDONATION (Lat. *condonatio*, from *condonare*, to pardon, from *com-*, together + *donare*, to give, from *donum*, Skt. *dāna*, gift, from Lat. dare, Gk. δίδόναι, *didonai*, OChurch Slav. *dati*, Lith. *duti*, Skt. *dā*, to give). In law, forgiveness of an act, by a husband or wife, which entitles the forgiving party to a divorce. Condonation may be either expressed or implied. If the parties have cohabited after a knowledge of the offense complained of, this is an implied condonation of the offense, and bars complaint unless the offense shall have been subsequently repeated. An act once condoned is, in the eyes of the law, as though it had never been committed, unless the guilty party repeats the offense, in which event the old offense becomes a valid ground of complaint. In other words, condonation is always conditional upon the discontinuance of the condoned misconduct. See DIVORCE.

CON'DOR (Sp., from Peruv. *cuntur*, condor). Any one of several species of large American vultures. Usually applied to the great vulture (*Sarcorhamphus gryphus*) of the Andes, one of the largest of known flying birds, the albatross and the California condor sometimes ex-

ceeding it. Its dimensions, however, have often been far overstated, the truth being that it varies in length from 44 to 55 inches, and in expanse of wing from 8½ to 10½ feet. The wings are long and extremely powerful; the tail short and wedge-shaped; the general color black, showing brightest in old males, which have much white in the wing. The young are brownish. Around the lower part of the neck of both sexes there is a broad white ruff of downy feathers, above which the skin is bare and exhibits many folds. The head of the male is crowned with a large, reddish, cartilaginous comb, and the neck is furnished with a dilatable wattle. The beak is thick and strong, straight at the base, but the upper mandible is strongly curved at the extremity. The condor feeds mostly on carrion. Its voracity is enormous. Tschudi mentions one in confinement at Valparaiso which ate 18 pounds of meat in a single day and seemed next day to have as good an appetite as usual. Condors often gorge themselves so that they cannot fly and, if attacked, must disgorge in order to escape. They inhabit regions 10,000 or 15,000 feet above the level of the sea, where they are usually seen in small groups, and where they breed. They make no nest, but lay their eggs on the bare rocks. To these haunts they return, after their descent into the plains for food. The height to which the condor soars in the air exceeds that of any other bird and is often far above the clouds.

Closely related to the condor, but distinguished by differences in the cartilaginous comb, bare neck, and shape of the bill, are the king vulture, or king of vultures (*Gypagus papa*), of the warm parts of America, and the Californian vulture (*Pseudogryphus californianus*). The king vulture is about the size of a goose and derives its name from its driving away other vultures from prey at its pleasure. Its plumage is finely colored, reddish above, white beneath, with bluish gray ruff and black quills and tail. The Californian vulture is often longer and of greater expanse of wing than the condor, but is usually not so heavy a bird. It is duller colored, and has less white on the wings. Its range was restricted to the Pacific coast region, from Oregon southward; it was nowhere really common, and it has now become extinct, except in southern California. Like other American vultures, it has no voice, the only sound that it utters being a hoarse hiss or sort of weak snorting. All these large American vultures belong to the family Cathartidæ, which includes the turkey buzzards and is less falconine than the Old World vultures. See VULTURE and Plate of VULTURES; EXTINCT ANIMALS.

The first satisfactory account of the condors was given by Humboldt. Consult for South American condor: Darwin, *A Naturalist's Voyage* (London, 1860); Stejneger, *Riverside Natural History*, vol. iv (Boston, 1885); Lucas, *Annual Report of United States National Museum*, 1889 (Washington, 1891); Adams, *The Condor*, vol. ix (California, 1907); Beebe, *Zoölogical Society Bulletin, No. 31* (New York, 1908). For California condor, Finley, *The Condor*, vols. viii, ix, x (California, 1906; 1907; 1908); Beebe, *Zoölogical Society Bulletin, No. 32* (New York, 1909).

CONDORCANQUI, kōn'dôr-kän'kwē, JOSÉ GABRIEL. See TUPAC AMARU II.

CONDORCET, kōn'dôr'sā', MARIE JEAN ANTOINE NICOLAS CARITAT, MARQUIS DE (1743–94). A French mathematician and philosopher of the Physiocratic school. He was born at Ribemont, was educated by the Jesuits, won distinction for mathematics in his youth, and became an active member of the Academy of Sciences in 1769. Gifted with a keen intellect and wonderfully universal sympathies, he became allied with the advanced thinkers and shared in the economic and religious propaganda of Turgot, D'Alembert, and Voltaire. An ardent supporter of the American Revolution of 1776, he wrote many papers concerning the United States, viz., *Lettres d'un citoyen des Etats-Unis sur les affaires présentes* (1788); *Lettres d'un Bourgeois de Newhaven à un citoyen de Virginie* (1787); *Réflexion sur l'esclavage des nègres* (1781), an interesting document on the question of negro slavery. He took an active part in the *Encyclopédie*, and, on the strength of his graceful *Eloges des Académiciens de l'Académie Royale des Sciences morts depuis 1666 jusqu'en 1699* (1773), he was made the perpetual secretary of the Academy of Sciences in 1777. He became a member of the French Academy in 1782. His *Eléments du calcul des probabilités* (1785), revised and enlarged in a posthumous edition (1804), was his most important contribution to mathematics. From this time politics claimed him in increasing measure. In 1786 he married Sophie de Grouchy, sister of the famous marshal, a brilliant woman of considerable talent, who later translated into French Adam Smith's *Theory of Moral Sentiments* (1798). He wrote a life of *Turgot* (1786) and of *Voltaire* (1787), and was chosen member of the National Assembly from Paris, becoming secretary of that body, and in February, 1792, its president. He composed several of its most important addresses and elaborated a scheme of public instruction which is the foundation of the present system of education in France. It was in this report (April 21 and 22, 1792) that he suggested five degrees of education: (1) primary schools; (2) secondary schools; (3) institutes; (4) lycées; (5) the Society of Arts and Sciences. Though finding Louis XVI guilty, he refused to vote for his execution. He was active in framing the constitution submitted to the Convention in February, 1793, but his opposition to the Terrorists led them to proclaim him an outlaw. Friends found him a refuge with a Madame Vernet, who said "the Convention could declare him outside the law, but not outside humanity." Fearful of being tracked hither and endangering his protectress, he escaped, was captured at Clamart by the Terrorists, and died in prison at Bourg-la-Reine, March 29, 1794, from apoplexy, exhaustion, or poison. While with Madame Vernet he wrote the *Esquissé d'un tableau historique des progrès de l'esprit humain*, a declaration of human perfectibility through emancipation from priests and rulers, narrow in its sensationalist philosophy and fanatic in its antispiritualism. His argument was based upon a succinct survey of the progress of humanity in the past, which led him to conclude that three distinct advantages were to be acquired by the human race: the destruction of inequality among men, the advance of equality in a given people, the amelioration of man himself. Condorcet's *Works* (Paris, 1847–49) contain a *Life* by Arago.

Consult: Morley, *Critical Miscellanies* (London, 1893); Cahen, *Condorcet et la Revolution française* (Paris, 1904); H. Sée, "Condorcet, ses idées et son rôle politique," in *Revue de Synthèse Historique* (1905); Eugène Caillaud, *Les idées économiques de Condorcet* (1909); Tallentyre, *The Friends of Voltaire* (London, 1906).

CONDOTTIERI, kôn'dôt-tyā'rē (It., pl. of *condottiere*, captain, leader). The name given in Italy in the Middle Ages to the leaders of companies of military adventurers who offered their services to any party in any contest for pay, and often practiced warfare on their own account for the sake of plunder. The name is frequently applied also to the members of their companies. These mercenaries were called into being by the frequent feuds of the Italian states during the Middle Ages. Among the most celebrated of their leaders were Sir John Hawkwood (c.1320–94), the commander of the famous White Company, who, after taking an important part in the wars between England and France, crossed into Italy and became captain general of Florence; Carmagnola (c.1390–1432), who fought in the pay of Milan and Venice and was executed at the latter city in 1432; and Francesco Sforza (1401–66), who in 1450 made himself Duke of Milan, to the exclusion of the lawful heirs of the Visconti. Venice began to employ condottieri in 1143, but their time of greatest activity was in the fourteenth and fifteenth centuries. Machiavelli paints them in the most unfavorable light and states that sometimes battles were fought by two condottieri in which no one was killed except by accident. Consult: Ricotti, *Storia delle compagnie di ventura in Italia* (2 vols., Turin, 1893); Block, *Die Condottieri: Studien über die sogenannten "unblutigen Schlachten"* (Berlin, 1913); Semerau, *Die Condottieri* (Jena, 1909).

CONDUCTING TISSUE. In botany, the system of vessels through which water and foods move from one part of the plant to another. See CONDUCTION.

CONDUCTION (Lat. *conductio*, union, from *conducere*, to lead together, from *com-*, together + *ducere*, to lead, connected with Goth. *tiuhan*, AS. *tēon*, OHG. *ziohan*, Ger. *ziehen*, to draw). In botany, a term applied to the transfer of water, foods, and other materials from one part of the plant body to another. In the smaller plants a sufficient amount of water can be supplied to cover evaporation and other needs, and the foods can be transferred, by relatively slow processes of diffusion and osmosis (qq.v.). In the larger plants, however, the amount of water and foods to be moved, and the relatively great distances to be traversed, have brought about the development of a system of tissues, arranged in elongated strands or in layers, specially adapted to facilitate transfer and known as the conducting system. These are for water chiefly the xylem, or wood, bundles, and for foods chiefly the phloëm, or bast, bundles, or perhaps the latex vessels. The xylem and phloëm bundles are usually associated, running side by side in the stems, the xylem either towards the centre, or with a phloëm bundle also on the central side of it, or surrounded by the phloëm. In the roots the primary xylem bundles are between the phloëm bundles, but by secondary thickening with age the same position as in stems is reached. So frequent is this association that the two bundles are usually described as regions of one fibrovascular bundle (q.v.). These bundles form a connected system of strands, continuous, through the stem, from youngest root to youngest leaf. In the leaves the bundles run in the larger ribs and constitute the smaller veins, becoming more and more slender. The final branches join with others to form a fine network, or end blindly among the green tissues, the xylem bundles being the last to disappear.

The Xylem and Water Conduction. The essential elements of the xylem are the tracheæ or tracheids, with which parenchyma cells and wood fibres are usually associated. The tracheids are cells whose walls have become unequally thickened as they mature; their protoplasm finally disappears, leaving only the empty cell wall. The tracheæ are similar, except that a large number of the end walls, where the elements of a row abut, have been resorbed, so that the cell chambers, empty as they finally become, communicate freely. The tracheæ, where best developed, are thus long tubes, half a millimeter ($\frac{1}{50}$ inch) or less in diameter, and 1 to 3 meters (3 to 10 feet) long. The remaining elements of the xylem are of less importance for conduction. (See MORPHOLOGY.) Through the xylem bundles the water absorbed by the roots travels to the leaves and other surfaces, from which it is evaporated. The water first enters the root hairs or the adjoining surface cells of the root (see ABSORPTION and ROOT); thence it traverses the cortex and enters the tracheary tissue and travels along it to its destination. Proofs that the xylem bundles are the path of the transpiration stream are found by girdling and by the use of colored solutions. When the xylem bundles are severed, the leaves wilt promptly, while all the other tissues of the stem may be cut without such a result. A solution of indigo carmine or eosin stains only the xylem strands when the cut end of a leafy shoot is plunged into it. It has further been shown that the water travels chiefly in the cavities of the tracheæ, though doubtless a portion traverses the walls themselves, and all must pass through many partition walls in its course. The movement is not at all like that of water in pipes or blood in vessels. The force concerned in the movement of water is not certainly known. In the smaller plants root pressure (q.v.) may cooperate, or under some circumstances may be sufficient; but it is not adequate to account for the rise in tall trees. Capillarity is to be excluded, since the conditions under which surface tension operates to raise water in small tubes are not present. Evaporation and the suction set up thereby play an important part; and probably the most important factor is the osmotic action in the living cells of the leaf. But no satisfactory explanation of the observed facts has as yet been found.

The Phloëm and Food Conduction. The essential elements of the phloëm are sieve cells and companion cells (parenchyma); often bast fibres accompany them. Sieve cells, like tracheæ, lose their living contents as they mature. The end walls, and often certain areas of the lateral walls, where they abut upon a like cell, become resorbed in spots and perforate. The perforate area is known as a sieve plate. Through the perforations the contents may pass freely. It has been shown that when the perforations in a membrane amount to less than 1 per cent of the area, there may pass through it 60 per cent of

the gases and solutes which could do so were the whole area open, provided they are being freely removed from the other side. In life the content of the sieve is a slime, in which are abundant the various foods, both proteid and carbohydrate. In addition to this evidence as to their function, girdling experiments have shown that when the phloëm bundles are severed the growth of parts beyond is hindered or stopped. Other tissues of the bundles participate in the transfer, but no decisive division of labor can be made out, beyond the fact that the sieve cells are most efficient.

Latex Vessels. The latex vessels are irregularly branched tubes (the branches sometimes connected into a network), containing a milky or colored sap called latex (q.v.). They are found in only 10 of the large families of plants, both monocotyledons and dicotyledons, in which they are believed to serve for the conduction of foods. The reasons for this are as follows: 1. The latex always contains, among a great variety of substances, foods whose amount varies much from time to time, and these variations seem to be correlated with variations in growth and development. 2. The latex vessels are developed early among the growing tissues where foods are needed. They have abundant branches in the leaves and special relations to the cells where food is made.

The mode by which the foods are transported in sieve cells and latex vessels is not known. The contents are under pressure from the turgor (q.v.) of adjacent living cells. Bending and the consequent mechanical compression would facilitate mixing of the contents. But diffusion movements are probably the main agency.

CONDUCTION OF HEAT. See HEAT.

CONDUC'TOR (Lat., leader, from *conducere*, to lead together). In music, the person who directs the chorus or orchestra, or both combined, and who is responsible for the interpretation of the works performed by the artists under his direction. A good conductor must be a thorough musician. He must have had careful training in all branches of musical composition, must be familiar with the compass and peculiarities of the voice and all orchestral instruments; must be a good score reader, and a man of broad musical culture, familiar with the styles of various epochs and masters. In addition, he must be gifted with poetic temperament, an unusually fine ear, a forceful, magnetic personality that commands instant obedience, and great coolness and presence of mind. That he be also a fine performer on some instrument is not essential; two of the world's greatest conductors, Wagner and Berlioz, were wretched performers. The principal work of the conductor is not done in public during performances, but during rehearsals. His preparation really begins at home. He must make himself thoroughly familiar with the score of the work he is to conduct. This is best done at the pianoforte. He must have a clear idea of the form of the work, of the melos (q.v.), of the different phrases. Before he conducts the first rehearsal he has decided on the interpretation of the work and knows exactly what he wishes each performer to do.

The first rehearsal of a new work (especially if performed from manuscript) is largely taken up with correcting mistakes in the parts. Here the conductor's ear must be on the alert. During rehearsal the conductor can convey his instructions to the singers and instrumentalists by means of the spoken word, audible beating of the rhythm, and by singing or playing to them. In choral works the chorus is rehearsed separately with the piano. The soloists also rehearse privately, with the conductor at the piano, before rehearsals with full orchestra begin. In studying instrumental works, like symphonies, a careful conductor often rehearses the strings and wind instruments separately. After the performers have become thoroughly familiar with the conductor's intentions, they are ready to be guided during the public performance by his baton and by signals given with the hand or eyes. By that time the conductor practically knows the score by heart. It lies before him more for occasional reference than actual reading. People in general know very little about the real responsibility and importance of the conductor. Berlioz does not exaggerate when he says that a poor singer or instrumentalist can ruin only his or her part, but a poor conductor can ruin the whole performance.

While the essential functions of the conductor have been pretty much the same at all times, the manner of conducting has varied greatly. The custom of beating time with a baton can be traced to the remotest antiquity, when oarsmen were directed by such means. When the baton was introduced for beating time in music is not known. An ancient manuscript is preserved in Paris, showing Heinrich von Meissen, a minnesinger, who died in 1318, directing a group of vocal and instrumental performers by means of a baton. We know nothing of the mode of conducting between that time and 1600. The earliest operatic performances were conducted from the harpsichord. In the recitative the leader struck the few chords upon the instrument, and in the concerted pieces he led. This he did by nodding the head, stamping the foot, and using one arm or even both arms. When the opera reached France and Germany, this mode of conducting was naturally employed in these countries also. In Italy this method maintained itself up to the first half of the nineteenth century. In Germany we find before 1700 that at performances of sacred works in churches the organist was assisted by a time beater. This time beater was not a conductor; he only indicated the time. But shortly after the beginning of the eighteenth century the Italian operatic method was adopted for the church, and the organist was the sole director, as is still the custom in churches of to-day. The earlier symphonic works were also conducted from the harpsichord. When the number of wind instruments increased, it was found that the tones of the harpsichord could not be heard by all players, and the time beater again made his appearance. In this manner Haydn and Mozart conducted their symphonies, they sitting at the harpsichord while some one else beat time. Beethoven conducted with the baton, and the first violin or concert master assisted.

Interpretative conducting may be said to have begun with Stamitz (1719–61) and his pupil Cannabich (1731–98), whom Mozart called the best conductor he ever heard. Cannabich developed the *crescendo* and *diminuendo* of the orchestra, one of the great means of expression. Gossec (1738–1829) must also be mentioned among the early conductors who developed orchestral technics. But these men were exceptions at their time. Interpretative conductors as a class did not exist before the beginning of

the nineteenth century. Among these the greatest were Spohr, Weber, and Mendelssohn in Germany, and Habeneck, a German by birth and training, in France. With Wagner and Berlioz begins the school of modern conducting, which is the culmination and natural development of the work begun by the four eminent conductors just mentioned. At first all the great modern conductors were German. France soon followed, a little later Italy and Russia, still later England. The beginning of this century marked the advent of the guest conductor who goes on extended tours like the great instrumentalists and vocalists, frequently with his entire orchestra. Among the best treatises on conducting are: Wagner, *Ueber das Dirigieren* (vol. viii of his collected works, Leipzig, 1888); Berlioz, *Treatise on Modern Instrumentation*, trans. by Bennett (London, 1882). Consult A. Chybinski, *Beiträge zur Geschichte des Taktschlagens* (Leipzig, 1912); H. Löbmann, *Zur Geschichte des Taktierens und Dirigierens* (Düsseldorf, 1913); G. Schünemann, *Geschichte des Dirigierens* (Leipzig, 1913).

CONDUCTOR and INSULATOR OF ELECTRICITY. The property of electrical conductivity is possessed in some degree by all known substances. There is, however, an enormous difference between the conductivity of those that are used as conductors and those that are used as insulators, the former having many million times the conductivity of the latter. The substances at the lower end of the scale are therefore of sufficiently low conductivity to serve for covering and supporting wires made of the good conductors, without permitting any serious escape of an electric current when the wires are charged.

In transmitting electricity from point to point, through telegraph or electric-light lines, e.g., those substances possessing the greatest conductivity, such as copper and iron, are selected to form a path for the current, and these are surrounded with materials which have the least conductivity or offer the highest resistance, such as air, rubber, porcelain, and glass, in order to confine the current and compel it to travel to the end of the line. When a conductor is so surrounded or so placed on nonconducting supports that it prevents the electricity communicated to it from passing into the ground or escaping, it is said to be insulated.

As the difference between conductors and insulators is merely one of degree, there is, even under the best conditions, a loss in the transmission of electricity over a line of wire proportionate to the amount of leakage through the insulation and the resistance to travel offered by the wire itself, since the slight effort required of the current to force its way ahead through the wire causes some of it to escape through the insulation in the same way that water forced through a long pipe will escape in small quantities at weak points. It is, indeed, extremely necessary to prevent conductors buried in the earth from having any connection with water or dampness, and, if the insulation of the conductor is defective in a damp spot, a certain proportion of the current will leave the conductor and travel through the earth. Chemically pure water is a nonconductor, but, as found in the earth, water is an excellent conductor on account of the materials it holds in solution.

The electrical conductivity and its reverse, the resistance of materials, are, therefore, subjects of great importance to electricians; and the selection of materials of high conductivity or low resistance for wires, and materials of high resistance for insulators, receives careful attention. The best conductors are gold, copper, silver, aluminum, brass, iron, and all other metals. The best insulators, or the worst conductors, are dry air, glass, mica, porcelain, paraffin, rubber, silk, gutta-percha, and almost all the hydrocarbons. The intermediate substances are many liquids and damp substances, carbons, minerals, and compound substances. The conductivity of all substances is greatly affected by changes of temperature. An increase of temperature increases the resistance of all the metals, while it has the opposite effect in other substances. Glass loses its insulating properties at a red heat, and so do wax, sulphur, amber, and shellac when fused.

Glass, if not the most perfect insulator, far exceeds others in hardness and durability and is much employed as insulation for light electrical apparatus. Hard rubber or vulcanite enters into the construction of much electrical apparatus on account of its high resistance. Paraffined paper is also employed for condensers (q.v.), while for the armatures of dynamos and motors mica is used. See ELECTRICITY.

CONE (Lat. *conus*, Gk. *κῶνος*, *kōnos*, cone, Skt. *śāna*, whetstone, from *śā*, to sharpen). A solid formed by a conical surface and a plane cutting all of the elements of this conical surface. A conical surface is generated by a line called the generatrix passing through a fixed point and tracing a fixed curve called the directrix. If the line is unlimited, it generates two conical surfaces, on opposite sides of the point (vertex), called the "nappes" of the cone. A cone whose base is a circle is called a "circular cone." If the vertex is on a line perpendicular to the base of a circular cone, through its centre, the cone is called a "right circular cone." A right circular cone may be generated by rotating a right-angled triangle about one of its perpendicular sides. The line from the vertex to the centre of the base is called the "axis." If the axis makes with the base an angle other than 90°, the cone is called "oblique." If a plane cuts a cone between the vertex and the base, the cone is said to be "truncated"; if the cutting plane is parallel to the base, the lower part is called a "frustum" of the cone, the section made by the cutting plane being called the "upper base." Three curves, called "conic sections" (q.v.), may be formed by planes cutting a right circular cone at various angles to the base. The mensuration of the cone was well known to the Greek geometers, the subject being most carefully studied by Archimedes (q.v.).

CONE, HUTCHINSON INGHAM (1871–). An American naval officer, born in Brooklyn, N. Y. He was brought up in Florida and graduated at the Florida Agricultural College in 1889 and at the United States Naval Academy (Annapolis) in 1894. He served on the *Baltimore* at Manila in the Spanish-American War, commanded a flotilla of torpedo boats from Hampton Roads to San Francisco in 1908, was fleet engineer in 1908–09 of the Atlantic Fleet in its trip around the world, and in 1909 became head of the important Bureau of Steam Engineering with rank of rear admiral. He contributed to periodicals articles on such subjects as machinery and fuels for naval vessels.

CONE, IN BOTANY. See CONIFERÆ.

CONE, Orello (1835–1905). An American theologian and author, born at Linclean, N. Y. He was educated at St. Paul's College, Mo., was professor of biblical languages and literature at St. Lawrence University from 1866 to 1880, and president of Buchtel College in 1880–96. In 1900 he returned to St. Lawrence University to take the chair of biblical theology. He edited the *International Handbooks of the New Testament*, and published: *Gospel Criticism and Historical Christianity* (1891); *The Gospel and its Earliest Interpretations* (1893); the particularly valuable *Paul, the Man, the Missionary, and the Teacher* (1898); and *Rich and Poor in the New Testament* (1902).

CONE, Spencer Houghton (1785–1855). An American Baptist clergyman, born at Princeton, N. J. He studied for two years (1797–99) at Princeton; was at first an instructor in private schools in Burlington, N. J., and Philadelphia, Pa.; and later became an actor, and played in Philadelphia and other cities with success for seven years (1805–12). He accepted a clerical position on the Baltimore *American* in 1812, and became publisher of the Baltimore *Whig*. In 1814, upon his removal to Washington, D. C., to be a Treasury clerk, he became a Baptist minister. In 1815 and 1816 he was chaplain to the House of Representatives, and in 1823 was called to the Oliver Street Baptist Church, New York City. In 1841 he took charge of the Broome Street Church, where he remained during the remainder of his life. From 1832 to 1841 he was president of the Baptist Triennial Convention for the United States. He was president of the American Bible Union from its formation to his death, and from 1837 until 1850 he was president of the American and Foreign Bible Society.

CONE FISH (so called from its shape). A small, somewhat globular sea fish (*Monocentris japonicus*) of the family Berycidæ, dwelling on the coasts of China, Japan, and the Philippines, and called by the Japanese "matskasa," or pine-cone fish. It is about 5 inches long, and the body is covered with large scales in appearance like a coat of mail carelessly put together. See Colored Plate of Philippine Fishes.

CONEGLIANO, kō'nâ-lyä'nō. A city in the Province of Treviso, northern Italy, situated on the stream of Monticano, 35 miles north of Venice (Map: Italy, G 2). It is commanded by a huge castle and has a cathedral containing a fine altarpiece by Cima (1492), a native of Conegliano. In the Loggia Municipale are monuments to Dante, Victor Emmanuel, Garibaldi, and the victims of the War of Liberation. The town is noted for its wine. It also engages in silk spinning and has a technical and a wine-making school. In 1808 Marshal Moncey was named Duke of Conegliano by Napoleon. Pop. (commune), 1881, 8938; 1901, 9796; 1911, 13,007.

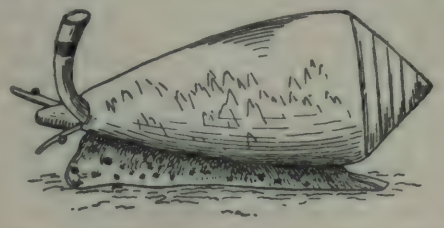
CONEGLIANO, Da. See Cima, Giovanni Battista.

CONEGLIANO, Duke of. See Moncey.

CONE-NOSE, or Kissing Bug. A bug of the predatory family Reduviidæ; specifically *Conorhinus sanguisugus*, called "giant bedbug" in the southern United States, where it is a pest in houses. It is three-quarters of an inch long, black with red patches, or spots, on the sides of the thorax, at the base and apex of the wing covers, and bands on the sides of the abdomen. The young much resemble large bedbugs (to which they are allied), and all ages are fierce biters and bloodsuckers, preying upon insects and flying into houses at night and attacking sleeping persons and animals. The kissing bug seems to breed in the nests of mice and is prevalent from the central Mississippi valley to the tropics. The name "assassin bugs" has been given to the whole family by Comstock, because of their cannibalism and rapacity; and to certain species, especially *Melanolestes picipes* and *Reduvius personatus*, which were especially abundant in the Eastern States during the summer of 1898, was due the "kissing-bug" excitement, busily fostered by the newspapers. Of the two "kissing bugs" above mentioned, the latter, according to Howard, is a cosmopolitan form which, in the Northern States, is found in basements and cellars of dirty houses and preys upon bedbugs and cockroaches. When immature, it covers itself with dust and presents a very odd appearance. The "thread-legged" bugs of the family Emesidæ, which rob spiders of their prey, are near relatives. Consult "Insects to which the Name 'Kissing-bug' Became Applied during the Summer of 1899," in *Bulletin, United States Department of Agriculture, Division of Entomology*, N. S. 22 (Washington, D. C., 1900).

CONEPATE, kō'nâ-pä'tâ (Nahuatl *nepatla*, subterranean dwelling). The name in Mexico of the large white-backed skunk (*Conepatus mapurito*), called in South America "mapurito." See Skunk.

CONE SHELL. The popular name of a genus (*Conus*) and family (Conidæ) of gastropod mollusks, of the order Streptoneura, having a shell of remarkably regular conical form; the spire on the base of the cone, and sometimes rising from it to a sharp point, sometimes almost flat; the aperture narrow and straight, without protuberance or fold, extending from the base of the cone to its apex. The head of the animal has a proboscis capable of much extension; the mantle is scanty and narrow, forming an elongated siphon in front; the shell is covered with an epidermis. These mollusks are carnivorous; they inhabit shores and banks of sandy mud, chiefly within the tropics, a few only occurring in the Mediterranean. The shells of many species are very beautiful and much prized by collectors. Cone shells first appear in Cretaceous rocks and become more abundant in later formations.



A CONE (WALKING TOWARDS THE LEFT).

The siphon is protruded and held upright; and the eyes are seen on the tentacular eyestalks springing from the head.

The young cone shells are elongated and have high spires, which in the adults are more or less completely shortened through envelopment by the outer whorls. These elongated spires are also characteristic of the adult stages of the early ancestors of the cones, of Cretaceous and Tertiary time, especially of the genus *Conorbis*, of the Eocene. The genus *Conus* has some doubtful representatives in the Cretaceous, about 150

species in the Tertiary, in the rocks of which age it is common and beautifully preserved, and it is at present approaching the maximum of its evolution. See Colored Plates of MARINE GASTROPODS.

CONES'SI BARK. See WRIGHTIA.

CON'ESTO'GA (Iroquois). Formerly an important tribe of the Iroquoian stock, occupying the country on the lower Susquehanna and about the head of Chesapeake Bay in Pennsylvania and Maryland, and claiming dominion over several smaller tribes on both sides of the bay. The name is said to mean 'people of the forked roof poles.' The French called them "Andastes," while to the Virginia tribes and the Southern colonists they were known as "Susquehannas." They lived in palisaded villages, and when first known were a powerful people, bidding defiance to the invading Iroquois, by whom, however, they were at last overcome about 1675. A part fled south through Virginia and took refuge in North Carolina, under the name of "Meherrin." Others were deported to the Iroquois country, whence they were afterward allowed to return, and settled at Conestoga, near Lancaster, Pa. Here they rapidly wasted away, until 1763, when the few that remained were massacred by a mob during the excitement provoked by the Indian wars.

CONEY, kō'nī *or* kūn'ī (OF. *conin*, Lat. *cuniculus*, Gk. *κόνικλος, koniklos*, or *κύνικλος, kyniklos*, rabbit; of Iberian origin). The old English name for the rabbit, used in the Bible as the translation of the Hebrew word *shaphen*, the local name for the Syrian hyrax, or daman (see HYRAX), and since applied to other mammals which superficially resemble either Lepus or Hyrax. The pika (q.v.) is known to hunters and miners in the western United States as the "coney," though it looks more like a guinea pig than a rabbit. In Jamaica the hutia (q.v.) is generally called the "Indian coney."

CONEY ISLAND. An island, included in the Borough of Brooklyn, New York City, and the most popular seaside resort in the vicinity of the metropolis; situated off the south shore of Long Island, 9 miles southeast of the Battery (Map: Greater New York, G 12). It is nearly 5 miles long, and from a few hundred feet to three-fourths of a mile wide, and is separated from the mainland by Coney Island Creek, a narrow tidal inlet, Gravesend Bay, and Sheepshead Bay. For a long period it was considered comparatively worthless; but as soon as its fine beach became recognized as a safe place for bathing, and regular communication by boat and railroad was established, the sporadic bathhouses and cheap hotels were replaced by more permanent structures, and its growth has been extraordinary. It is now reached by steamboat service from Manhattan, by the Long Island Railroad, and by various trolley lines and elevated roads. There are several sharply differentiated districts. West Brighton is the centre for the mass of visitors and for the cheaper amusements and embraces the district usually referred to by the name "Coney Island." About three-quarters of a mile to the east is Brighton Beach, where there are a large hotel, a theatre, and the Brighton Beach Race Track, while still farther to the east is Manhattan Beach, which extends to the end of the island. Here are a large hotel, baths, and a residential district under development. At the western end of the island is the select residential district called "Sea Gate," the fine clubhouse of the Atlantic Yacht Club, and a lighthouse on Norton's Point.

CONFAR'REA'TION (Lat. *confarreatio*, from *confarreare*, to marry by an offering of spelt, from *com-*, together + *farreus*, made of spelt, from *far*, spelt; connected with OChurch Slav. *bŭrŭ*, AS. *bere*, Eng. *barley*). A form of celebrating marriage, of peculiar solemnity and of great antiquity, among the Romans. It was a customary form, originally restricted by law to the patricians, among whom it originated. It retained its superior sanctity and validity long after it had been extended to the plebeians, and after simpler and less conventional forms of marriage had come to be recognized. Its specialty consisted in the employment of certain words in the presence of witnesses, and in the performance of a religious ceremony in which *panis farreus* (bread made of spelt) was used. Many of the high offices of state, especially such as were of a priestly character, were open only to those who were born of parents thus married. See MARRIAGE.

CONFEC'TIONERY (from ML. *confectionarius*, confectioner, from Lat. *confectio*, preparation, from *conficere*, to make up, from *com-*, together + *facere*, to make). Preparations of sugar, or of material of which sugar is the principal ingredient, with the addition of attractive colors, flavoring extracts, nuts, fruits, and sometimes fat, starch, glucose, and gelatine, used as sweetmeats.

Where confectionery is pure its use in reasonable quantities involves no danger to health, as sugar is required as a food element, especially in processes of growth and for its antiseptic and other properties. Unfortunately a certain proportion of the cheaper kinds of candy are adulterated and colored with poisonous ingredients. The common adulterants used are terra alba, kaolin, and other mineral substances intended to give weight and volume to the mass, but national and State laws are endeavoring to restrict such practices. Most organic coloring materials used in candy making are harmless, but neither mineral colors nor coal-tar dyes should be used. The best flavors are true fruit extracts, essential oils like peppermint, etc. Artificial flavors are inferior and undesirable.

Until the beginning of the nineteenth century the art of making sweetmeats was practiced chiefly by physicians and apothecaries, who used sugar and honey to conceal the taste of their medicines. Medicated candies are still largely made by drug manufacturers, and such drugs as sulphate of quinine are not infrequently seen with chocolate coatings. During the earlier half of the nineteenth century the art of candy making was an English specialty. In 1851 an international exhibition was held in London, and the unique collection of candies there exhibited attracted to this industry the attention of other nations, especially Germany and France. The latter soon excelled all other countries in the art of making chocolate bonbons and still maintains its supremacy, which perhaps might be disputed in America. In the United States, as early as 1816, there were 20 candy factories in the city of Philadelphia and probably as many more in New York. The candy manufacture of the State of New York in the census year 1840 was valued at $386,142, and in Pennsylvania the product amounted to $227,050. In the next 10 years, with the introduction of machinery, the growth was most rapid. Previous to 1845 each

candy dealer made his own goods by hand, the assortment being limited to stick and molasses candy and sugarplums and a few imported fancy candies. In 1845 the first machinery, in the form of a revolving steam pan, was introduced by Sebastian Chauveau, of Philadelphia, and the following year a lozenge-making machine was invented by Oliver R. Chase, of Boston, and put into operation in his candy factory. Since that time new forms of machinery have constantly been added to such an extent that the manufacture of candy forms a separate and important industry which has undergone extensive development. A machine for printing on candies was invented by Daniel G. Chase in 1866, which produced the so-called "conversation lozenges." The increased consumption of chocolate soon led to its use combined with sugar and other materials in confections that were widely demanded.

The growth of the confectionery industry in the United States as represented by the large factories has been very great. In addition, an enormous amount of candy is made every year by small establishments from which statistics are not obtainable, and it is noteworthy that many small manufacturers through the excellence of their product are often able to build up a reputation and profitable business in a few years. In 1850 there were in the United States 383 large factories, employing 1733 hands and producing $3,040,671 worth of goods. In 1900 the number of large factories was 4297, with an invested capital of over $35,000,000; 33,583 persons were employed, and the value of the product was $81,290,543. In 1909 the United States Census of Manufactures reported the product of 1944 establishments, 12 of which produced each over $1,000,000 worth of candy, as valued at $134,795,913, with an invested capital of $68,326,471. The industry gave employment to 44,638 wage earners. This was independent of the chocolate industry (see CHOCOLATE), with which confectionery is closely allied.

In 1884 the National Confectioners' Association of the United States was organized. It includes the leading manufacturers of the country; and one of its purposes is "to advance the standard of confectionery in all practicable ways and absolutely to prevent harmful adulterations." In most States the sale of candy containing harmful or poisonous ingredients is forbidden by law and many local pure-food laws and ordinances take cognizance of such practices, especially where school children are likely to be affected.

Bibliography. Consult Neil, *Candies and Bonbons and How to Make Them* (Philadelphia, 1913); Grillen, *Modern Practical Gum Work Manual* (New York, 1911); François, *Les aliments sucrés industriels*, with bibliography (Paris, 1912).

CONFEDERACY, THE. A comedy by Vanbrugh (1705), said to have been adapted from Dancourt's *Bourgeois à la mode.*

CONFEDERACY, UNITED DAUGHTERS OF THE. A woman's patriotic society organized in Nashville, Tenn., in 1894, for the preservation of the memory of Southern devotion and suffering during the Civil War. The society admits to membership the direct female relatives and lineal female descendants of those who served honorably in the Confederate service, or who in some other direct way aided the Confederacy. The organization is subdivided into local chapters, of which there were, in 1914, 1380 in the Southern States and elsewhere. These are governed by State divisions, which in turn are controlled by a general organization. Annual reunions are held, usually in November. The membership in 1914 was over 80,000.

CONFED'ERATE STATES OF AMERICA. The name adopted by the federation of those 11 commonwealths of the United States of America which seceded from the Union in 1861 and were arrayed against the national government during the Civil War (q.v.). None of the theories of "State sovereignty" was inconsistent with membership in a properly federated union, and even the extreme advocates of those views recognized the advantages of the essential features of the existing system of national government. Thus, the convention of South Carolina, at the time of the adoption of its ordinance of secession, Dec. 20, 1860, expressed a strong desire for the early formation of a new confederation by the States at that time contemplating secession. Three weeks later the convention of Mississippi, at a time, as Davis wrote, "when the last hope of preserving the Union of the Constitution was extinguished," indorsed this proposal, as did also the convention in Florida on Jan. 10, 1861. On the following day the convention of Alabama made the proposition more specific by inviting the other Southern States to send delegates to a convention to be held at Montgomery, Ala., on February 4, in order that they might consult "as to the most effectual mode of securing concerted and harmonious action in whatever measures may be deemed most desirable for the common peace and security." Similar action was taken by the convention of Georgia, on January 19, and by that of Louisiana, on January 25, with the result that at Montgomery on the appointed day there gathered delegates from these six States, who organized as a provisional Congress of the Confederacy. By this body for one year, and thereafter by the more representative bicameral body which succeeded it, were directed the affairs of the new confederation, these bodies undertaking quite as complete an exercise of the more essential functions of a national government as had hitherto been undertaken by the old national Congress. Technical objections were dispelled by the exigencies of the situation, and the Congress was recognized as actually possessing, and as entitled to exercise, the powers of general government throughout the States then and thereafter represented in its membership. The authority and influence thus acquired was enhanced by the presence in its sessions not only of many men who had rendered efficient service in a similar capacity at Washington, but also of men who were at the time recognized as leaders of Southern thought and action, such as Wigfall of Texas, ex-President Tyler, Roger A. Pryor, and James M. Mason, of Virginia; Rhett and Barnwell, of South Carolina; Campbell, of Mississippi; Toombs, Cobb, and Stephens, of Georgia; and McRae and Curry, of Alabama. In the first instance the Congress, as originally organized, was particularly a constituent body, and among its first acts was the adoption, on February 8, in behalf of the six States represented, of a temporary constitution of government, to have force for "one year from the inauguration of the President, or until a permanent constitution or confederation between the said States shall be put in operation, whichsoever shall first occur." The convention, however,

went further and assumed to act as the legislative body of this new government, on the following day enacting that all laws of the United States in force in the Confederate States on Nov. 1, 1860, and not inconsistent with the constitution of the Confederacy, should be continued in force until repealed or altered by the Confederate Congress. To the same end provision was made for the continuance in office, at least for a time, of all administrative officials, and in order to hasten the detailed organization of the new national government, the more important congressional committees, upon war, finance, and foreign affairs, were forthwith appointed. The provisional Congress furthermore assumed the function of naming the chief executive officers, and on February 9 chose, as provisional President of the Confederacy, Jefferson Davis (q.v.), of Mississippi, and as provisional Vice President, Alexander H. Stephens (q.v.), of Georgia. Mr. Davis had already been appointed to the chief command of the Mississippi troops, and, although seeming strongly to prefer the military service, he relinquished his plans and undertook promptly the duties of the civil office which had come to him thus unsolicited, and in which he was to become recognized as the leader of the Confederacy. His first important act as President, the choice of a cabinet, was controlled rather unduly by political and geographical considerations. Each of the States represented, except that which secured the presidency, was allotted a cabinet officer, as was also Texas, which at that time was practically, although not formally, in the control of the Secessionists. The result was a group of high officials, among whom only two were recognized as men of especial ability—the noted Robert Toombs (q.v.), of Georgia, who became Secretary of State, and Judah P. Benjamin (q.v.), of Louisiana, a man of considerable repute as a barrister, who became Attorney-General. The executive departments were promptly organized, although the activity of some, particularly that of the navy, soon became limited, and the administration of public affairs proceeded thenceforth along lines familiar to Americans, and without unusual incident except such as naturally arose from the instability of the government, from the gradual overshadowing of the civil branches of government by the military, and from its final collapse.

The formal inauguration of Mr. Davis as President occurred on Feb. 18, 1861, when, in the course of his inaugural address, he said: "We have entered upon the career of independence, and it must be inflexibly pursued. Through many years of controversy with our late associates of the Northern States we have vainly endeavored to secure tranquillity and obtain respect for the rights to which we were entitled. As a necessity, not a choice, we have resorted to the remedy of separation, and henceforth our energies must be directed to the conduct of our own affairs, and the perpetuity of the Confederacy which we have formed. . . . With a constitution differing only from that of our fathers in so far as it is explanatory of their well-known intent, freed from sectional conflicts, which have interfered with the pursuit of the general welfare, it is not unreasonable to expect that States from which we have recently parted may seek to unite their fortunes to ours under the government which we have instituted. For this your constitution makes adequate provision; but beyond this, if I mistake not the judgment and will of the people, a reunion with the States from which we have separated is neither practicable nor desirable." The constitution of which President Davis thus spoke was intended only for temporary use, and the convention accordingly, on March 11, 1861, adopted and submitted to the various States for ratification, the permanent constitution of the Confederate States. In large measure this instrument was identical with the Constitution of the United States, although between the two there were natural divergences of theory as well as some differences of detail. Thus, the President was made ineligible for reëlection, and his term was fixed at six years; a qualified membership in Congress of cabinet officers was made possible; special prohibitive duties were forbidden; ordinary appropriations were made dependent upon a two-third vote in each house; and the President was empowered to veto specific portions of an appropriation bill, while approving other portions. Where opportunity offered, the phrases of the new constitution were so turned as to express the views of the Southern leaders as to sovereignty and as to the proper position of commonwealths in any union or federation. Thus it was specifically stated that each State was "acting in its sovereign and independent character," that legislative powers were "delegated" thereby, rather than "granted," and that citizens of one State might "sojourn" in another State with their slaves without losing any right of property therein. The new constitution was, as the New York *Herald* then said, "the Constitution of the United States with various modifications and some very important and most desirable improvements."

The provisional Congress also made provision for the formation of a permanent army of the Confederacy, proceeded early to establish various sources of public revenue, and promptly attempted to secure from foreign governments both material assistance and formal recognition. The character and work of the army thus organized formed possibly the most distinctive feature in the work of the Confederacy. (See CIVIL WAR.) The development of a system of public finance was hampered by the prevalent opposition to internal taxes, while the small quantities of dutiable goods imported made the customs duties an inappreciable element in the public revenue. To meet this exigency, special war taxes were levied, repeated issues of treasury notes were made, and very large amounts of bonds were authorized by the new government. Produce loans also were resorted to—the bulk of the subscriptions for which were made in cotton—and subsidies or loans to the central government were made by some of the States, so that the first year was passed with a semblance of financial stability. A considerable sum was realized from the placing of a foreign loan based on cotton, which loan was effected in the spring of 1863. With the increase of the bond issues, and especially with the abnormal expansion of the currency, prices were forced upward, credit became unsettled, the gold and silver in general circulation were driven out of the country by the enormous issues of paper money, and financial demoralization became pronounced towards the close of the war, when the price of a gold dollar was 60 times its price at the beginning of the war, when boots sold at $200 a pair, and when the price of coffee had increased nearly

200 times, on account of the scarcity produced by the blockade, and the price of cereals nearly 90 times. Normal business was thus completely deranged, while the rage for speculation and the spirit of gambling naturally pervaded the transactions of daily life. The action of the Confederate Congress in February, 1864, in passing a law requiring note holders to fund their notes before a certain date, after which notes would be taxed a third or more of their face value, practically wrecked the government's credit. In seeking to enlist the aid of foreign governments, the steps taken by the Confederacy early gave occasion for critical relations between England and the United States (see TRENT AFFAIR), and led also to serious diplomatic complications in the later years (see ALABAMA CLAIMS), although the efforts of this character were to a considerable degree successful, and at times reached such a point as to foreshadow foreign intervention, or at least recognition to an extent that would have made the success of the Confederacy, if not imminent, certainly far less improbable.

The early months of the Confederacy were marked, in addition to the rapid steps of organization and of preparation for conflict, by an effort at peaceable adjustment. In response to a call of the Virginia Legislature, a peace convention met at Washington in February, 1861, and delegates from seven slaveholding States, including Tyler and Rives of Virginia, Caruthers of Tennessee, and Clay of Kentucky, took part in its futile proceedings. During the following month there were active at Washington three formally appointed commissioners of the Confederate Congress—Messrs. Crawford of Georgia, Forsyth of Alabama, and Roman of Louisiana—who endeavored, largely through the mediation of Justice Campbell of the Supreme Court, to secure recognition and to arrange some reasonable basis of at least a temporary settlement, pending more formal negotiations. This effort also proved abortive through a misunderstanding, involving charges of breach of faith, as to the relief of Fort Sumter. With the withdrawal of these commissioners from Washington and the disappearance of any possibility of voluntary recognition by the Northern government, the position of the Confederacy was more clearly defined. Its strength, moreover, was increased by the secession of Virginia on April 17, of North Carolina on May 20, and of Tennessee on June 8, so that there were 11 States in the new union when its Congress met for its third session on July 20, 1861, at the new capital of the Confederacy, Richmond, Va. Upon the 6th of November were held the first general elections under the permanent constitution, resulting in the choice by a unanimous electoral vote of Davis as President, and Stephens as Vice President. The fourth and last session of the provisional Congress closed on Feb. 18, 1862, when the new Senate and House assembled, including in their membership such men as Clay and Yancey of Alabama, Hunter of Virginia, and Wigfall of Texas. Upon the 22d Davis was formally inaugurated as President for a term of six years, but the remaining years of his service were distinguished not so much by his administrative services as by the conflict between the civil and military elements, and by such controversies as that over the suspension of the writ of habeas corpus, the whole situation gradually becoming more and more abnormal, and being to some extent typified by the studied omission to provide for the creation of a supreme court. The course of the President in his official career provoked at the time much severe criticism and later occasioned a variety of comment. Of his election one recent writer says that "the choice was the best that could have been made," while another equally competent critic describes the situation as follows: "The strongest and most self-assertive spirit of the senatorial clique, having been chosen President, at once began to quarrel with his associates and to drive them from his counsels; there was no popular strength in the provisional Congress to resist him; and even before the inauguration of the permanent government the Confederacy had become a military despotism of the executive." Such a tendency was increased by the custom of holding secret sessions of Congress and by the practice of cabinet officers exercising their right to sit in Congress, as well as by the gradual lowering of the political morale and independence of that body. This unfortunate condition of affairs was further complicated by personal controversies among officials, both civil and military, in the highest stations, so that the later months of the administration of the Confederacy were such as to indicate the approach either of internal crisis or of complete dissolution, and such as to make the collapse of the government, on the fall of its capital, a natural and inevitable event. The first Congress under the permanent constitution had held four sessions, and the second Congress had held two sessions, the final adjournment of the body having been taken on March 18, 1865. The cabinet officials who served the Confederacy were as follows: Secretary of State, Robert Toombs, of Georgia, Feb. 21, 1861; R. M. T. Hunter, of Virginia, July 30, 1861; Judah P. Benjamin, of Louisiana, Feb. 7, 1862. Secretary of the Treasury, Charles G. Memminger, of South Carolina, Feb. 21, 1861; George A. Trenholm, of South Carolina, June 13, 1864. Secretary of War, L. P. Walker, of Alabama, Feb. 21, 1861; Judah P. Benjamin, of Louisiana, Nov. 10, 1861; G. W. Randolph, of Virginia, March 17, 1862; James A. Seddon, of Virginia, March 22, 1862; John C. Breckenridge, of Kentucky, Feb. 15, 1865. Secretary of the Navy, Stephen R. Mallory, of Florida, March 4, 1861. Attorney-General, Judah P. Benjamin, of Louisiana, Feb. 21, 1861; Thomas H. Watts, of Alabama, Sept. 10, 1861; George Davis, of North Carolina, Nov. 10, 1863. Postmaster-General, John H. Reagan, of Texas, March 6, 1861.

While the political organization of the Southern Confederacy was thus almost identical with that prevailing at the North, the outbreak of the war served to accentuate in important respects the marked difference between the two sections, particularly in those features which were of especial importance in time of war. Not only did the population of the Union States exceed that of the seceding States in the proportion of five to two, but the discrepancy was even greater in material resources. In general wealth, in foreign commerce, in internal improvements, and in manufactures, especially of fabrics and of *matériel* of war, the North was vastly superior to the South. Thus, the value of the improved lands of the seceding States was estimated at less than $2,000,000,000, while the value of those in the Union States was nearly $5,000,000,000. In the South were 150 fabric factories, with a product valued at $8,000,000;

while in the North there were 900 such factories, with a product valued at $115,000,000. In the South some 2000 persons were employed in the manufacture of clothing, while in the North 100,000 persons were so engaged. During the year 1860 the imports of the South were valued at $31,000,000, and those of the North at $331,000,000. It was thus apparent that the South was "dependent on Europe and on the North for everything but bread and meat." The South, indeed, seemed fairly supplied with foodstuffs, but the destruction of the crops by the advancing Northern armies, the lack of transportation facilities, and the paper-money policy with its attendant repressive measures, brought it about that at the end of 1864 there was a "general distress for food" and "an actual prospect," as a leading Southerner stated it, "of starving the Confederacy into submission." In addition to these serious obstacles to success, the South was seriously embarrassed by the lack of powder mills and of suitable ironworks. Only one plant, the Tredegar Iron Works at Richmond, was capable of turning out the larger types of field guns, and it was not until the close of the war that operations were well under way for equipping the South with suitable ammunition and arms plants. Its railway system was poorly developed, and the railways inadequately equipped. Moreover, such minor supplies as leather were very limited and at times quite unavailable, and throughout all branches of activity were apparent the very unusual difficulties under which the Confederacy was obliged to carry on its work of administration and of warfare. The conditions prevailing at the end of such a struggle and the results of the termination of such a conflict appeared more tangibly in the following years of Reconstruction, where the energies of the defeated were directed towards the economic regeneration of the South as well as to its political reorganization. Suffice it to say, the desperate efforts made by the South to maintain itself in a struggle against overwhelming odds left that section, at the close of the War, a complete wreck financially and industrially. See also SLAVERY and RECONSTRUCTION, and the articles on the various States mentioned.

Bibliography. Important works by Southerners are: J. Davis, *Rise and Fall of the Confederate Government* (2 vols., New York, 1881); A. H. Stephens, *Constitutional View of the War between the States* (2 vols., Philadelphia, 1870); and the several works of E. A. Pollard, especially his *Lost Cause* (New York, 1867). There is a short bibliography in A. B. Hart, *Guide to American History*, sec. 209 (Boston, 1890), and a paper, "Materials for the History of the Government of the Southern Confederacy," in the *American Historical Society Papers* (New York, 1890). A recent and valuable work on financial and industrial matters, by J. C. Schwab, is *The Confederate States of America* (New York, 1901; contains a full bibliography). Consult also: J. D. Bulloch, *The Secret Service of the Confederate States in Europe* (New York, 1884); Callahan, *Diplomatic History of the Southern Confederacy* (Baltimore, 1901); J. L. M. Curry, *Civil History of the Government of the Confederate States* (Richmond, 1901).

CONFEDERATE VETERANS, UNITED. A patriotic society organized in New Orleans, La., in 1889. Its objects are to unite in a general federation all associations of Confederate veterans now or hereafter in existence; to gather authentic data for an impartial history of the war between the States; to preserve relics and mementos; to cherish the ties of war friendships; to aid veterans and their widows and orphans; and to keep alive the memory of the dead. Membership is extended to all surviving soldiers or sailors of the Confederate service. The local organizations called camps, in 1914, were about 1170 in number, and were organized in three departments, as follows: the Army of Northern Virginia Department; the Army of Tennessee Department; and the Trans-Mississippi Department. The badge worn on the lapel of the coat is a square miniature Confederate flag. Membership in 1914 was about 55,000. The *Confederate Veteran*, Nashville, Tenn., is the official organ.

CONFEDERATE VETERANS, UNITED SONS OF. A patriotic society organized in Richmond, Va., in 1896. Its objects include: the cultivation of friendships among its members; the encouragement of the writing of war incidents; the collection of original data for an impartial history of the Confederate side; the preservation of relics and mementos; the perpetuation of an accurate record of the services of every Confederate veteran; the support of pensions, soldiers' homes, and other agencies for the relief of needy Confederate survivors, their widows and orphans; and the erection of monuments and memorials. Membership is restricted to male descendants of Confederate soldiers or sailors who served "to the end of the war, or who died in prison or while in actual service, or who were killed in battle, or who were honorably retired or discharged." The unit of organization is the camp, which consists of: subdivisions of States (brigades); State organizations (divisions); and groups of State divisions (departments), viz., Army of Northern Virginia Department; Army of Tennessee Department; and the Trans-Mississippi Department. Annual reunions are held. The publications consist of the minutes of its conventions, copies of the constitution, separate reprints of the reports of the historical committee, etc. The membership in 1914 was about 50,000. The Mississippi Division in 1902 purchased Beauvoir, the home of Jefferson Davis, and turned it over to the State for use as a soldiers' home.

CONFED'ERA'TION (Lat. *confœderatio*, from *confœderare*, to unite in a league, from *com-*, together + *fœderare*, to make a league, from *fœdus*, league; connected with Lat. *fides*, faith, from *fidere*, to believe, Gk. *πείθειν, peithein*, to persuade, Goth. *bidjan*, OHG. *bittan*, Ger. *bitten*, to request, AS. *biddan*, Eng. *bid*). An alliance of nations, states, or princes, according to Woolsey (*Introduction to International Law*, sec. 104), a union more or less complete of two or more formerly independent states. The New England Confederation (1643–84) is the earliest example of confederation in America. In 1777 the Continental Congress adopted the Articles of Confederation, setting forth the great principles of government which, with such additions as were necessary "in order to form a more perfect union," were later embodied in the Constitution of the United States. Most of the Latin-American republics have come into being on a basis of confederation. In 1815 the German Confederation was formed to replace the Holy Roman Empire, which confederation had been dissolved in 1806. The North German Confederation (1866–70) preceded the estab-

lishment of the German Empire, by whose original constitution all the states of Germany "form an eternal union for the protection of the realm and the care of the welfare of the German people." The Swiss Confederation, comprising at present 22 autonomous cantons, had its origin in 1291 in the union of the cantons of Uri, Schwyz, and Lower Unterwalden.

CONFEDERATION, ARTICLES OF. See UNITED STATES.

CONFEDERATION, GERMAN. See GERMANY.

CONFEDERATION OF THE RHINE. A league of German princes formed in 1806 under the protection of Napoleon. The first to seek the French alliance were the Electors of Bavaria and Württemberg, who, in recompense for their services, were elevated to the dignity of kings by the Peace of Presburg, Dec. 26, 1805. At Paris on July 12, 1806, 16 German princes formally signed an act of confederation, dissolving their connection with the German Empire and allying themselves with France. These princes were the Kings of Bavaria and Württemberg, the Arch-Chancellor Dalberg, the Elector of Baden, the Duke of Cleves and Berg (Joachim Murat), the Landgrave of Hesse-Darmstadt, the Princes of Nassau-Usingen, Nassau-Weilburg, Hohenzollern-Hechingen, Hohenzollern-Sigmaringen, Salm-Salm and Salm-Kyrburg, the Duke of Arenberg, the Princes of Isenburg-Birstein and Liechtenstein, and the Count of Leyen. The princes justified their conduct by enumerating the vices of the constitution of the German Empire, promised to aid Napoleon in his wars with an army of 63,000 men, and called upon the other princes of Germany to imitate their example. The Arch-Chancellor Dalberg was made Prince Primate of the confederation, with his seat at Frankfort. During the years 1806–08 other German sovereigns enrolled themselves as members of the confederation, and at the close of 1808 it embraced a territory of 122,236 square miles, contained a population of 14,608,877 souls, and kept up an army of 119,180 men. The disasters which overtook the French army in the Russian campaign acted like a solvent on the confederation, and it vanished in 1813, not, however, to be returned to its original princes, but to be delivered, by the foolish diplomacy of Talleyrand (q.v.), to Prussia. Consult: Rambaud, *La domination française en Allemagne, 1804–11* (Paris, 1876); Seeley, *Life of Stein* (3 vols., Cambridge, 1878); and the general histories of Ranke, Pertz, Oncken, and Treitschke. See GERMANY.

CON'FERENCE (ML. *conferentia*, from Lat. *conferre*, to carry together, from *com-*, together + *ferre*, to bear). The assemblage of persons gathered for the purposes of consulting upon any course. There have been many international conferences, such as those of Geneva in 1864, of London in 1864, 1867, and 1871, of The Hague, 1899, and the Balkan Conference at London in 1912–13. An ecclesiastical conference was held at Hampton Court Palace, at the instance of James I, in 1604. It was composed of prelates of the Church of England and dissenting ministers, the object being to establish a scheme of "comprehension" or common creed. This conference led to the translation of the Bible known to English readers as the Authorized Version. Another conference was held in 1661, the Savoy House Conference, when some alterations were made in the Prayer Book. Similar conferences were once frequent in the Roman Catholic church, and in other churches there are pastoral and other conferences. The annual meeting of the Wesleyan Church of England is called the "Annual Conference"; and the title is used for annual or other stated sessions in the Methodist Episcopal, the Evangelical, and some Baptist denominations. Under the name of "Evangelical Church Conference," delegates from the Reformed churches in the German states and Austria meet for the consideration of questions affecting church matters.

CONFER'VA (Lat., a kind of water plant, from *confervere*, heat, from *com-*, together + *fervere*, to be hot). A general term sometimes applied to certain simple filamentous green algæ. Also the name of a genus of the Chlorophyceæ (q.v.).

CONFES'SIO AMAN'TIS (Lat., The Lover's Confession). A long poem of over 30,000 lines by John Gower (1393). It is a conversation between Genius, the representative of Venus, and a lover, in which a series of tales, illustrating the effects of the various vices, is introduced.

CONFES'SION. In the theology of the Church, Eastern and Western, an acknowledgment of sins to God in the presence of a priest in order to obtain absolution. The practice of confession is taught by the Church to be of divine institution, being a part of that sacramental system which extends the benefits of the Incarnation and Atonement in the scheme of redemption to individual souls. It is explicitly mentioned in the New Testament (Matt. xvi. 19; xviii. 18; John xx. 22, 23; 2 Cor. v. 17–21) and is specifically included in the power of binding and loosing from sin conferred on the Apostles and transmitted to their successors. No formal scriptural precept is alleged for it, but it is contended that sufficient witness to its explicit use and value is contained in the practice and discipline of the Christian Church from early times and in the passages above cited. Though the Apostle James recommends that Christians should confess their "faults one to another," yet open and public confession appears to have been required in cases where persons guilty of gross apostasy desired to be reinstated in their full relationship to the Church. Open or public confession, which was part of the discipline of public penance, ceased when that discipline went into disuse. Private confession has been retained, and its defenders hold it to have been at all times in use. A general law for the Western Church was enacted by the fourth council of the Lateran in 1215 (can. xxi, *omnis utriusque sexus*) requiring that every Christian who has attained the years of discretion should confess to a priest approved for the purpose, at least once in the year. Confession is one of the three "acts of the penitent"—contrition, confession, and satisfaction—which the Council of Trent declares to be parts of the sacrament of penance. The sinner is required to confess each and every mortal sin, in thought, word, and deed, which, after diligent examination of his conscience, has occurred to his memory. To conceal one deliberately vitiates the confession, since the soul cannot be restored to the friendship of God while consciously unrepentent of any sin. He is exhorted, but not required, also to confess venial sins (q.v.), especially if they be habitual. Confession, in order to be fruitful, must be accompanied by contrition and a purpose of amendment. It commonly embraces the sins committed since the

last confession, but may include a longer period and even the entire life. In the latter case the confession is called general. It is called "auricular," as being made to the private "ear" of the priest, and is ordinarily spoken, but in cases of necessity may be made in writing, by signs, or by an interpreter. Priests cannot validly, except *in extremis*, receive confessions in any place without the "approbation" of the bishop of the place, which may be given absolutely or with restrictions. Confession is prescribed in the ritual of the Greek, the Russo-Greek, the Coptic, the Syrian, and the other Oriental churches. In most of these churches the practice is obligatory, but in some it has gone into disuse. The Lutheran church professes (according to the eleventh article of the Augsburg Confession) "that private confession must be retained in the Church; but that full and particular statement of *all* sins is not necessary, because, according to Ps. xix. 12, it is impossible." In the Apology of the Augsburg Confession it is said to be "impious" to abolish the practice of private confession to the priest; but in practice the Lutheran church has widely departed from these rules. The Reformed church in Germany has always been more inclined to general confession, and the United church also substitutes for private confession certain devotional exercises previous to communion. The Church of England has retained the general doctrine of the Western Church on confession. In the Morning and Evening Prayer in the Book of Common Prayer and in the Communion Office general forms of confession and absolution are retained which latter explicitly states that Christ "hath given power and commandment to His Ministers to declare and pronounce to His people being penitent the Absolution and Remission of their sins." Private confession is provided for in the office for the visitation of the sick, and in one of the exhortations in the Communion Office people are invited to come to receive the "benefit of absolution." The American Prayer Book does not contain the provision in the visitation of the sick, but makes provision in the visitation of prisoners for a "particular confession." No office is set forth because it does not lie in the scope of common prayer. See ABSOLUTION; PENANCE; CONTRITION. Consult Lea, *A History of Auricular Confession and Indulgences in the Latin Church* (Philadelphia, 1896). Casey, *Notes on a History of Auricular Confession* (Philadelphia, 1899), is a Catholic criticism on Lea's work. For the Church of England, see Carter, *The Doctrine of Confession in the Church of England* (London, 1885).

The *sigillum confessionis* ('seal of confession') means the obligation of a confessor or priest not to divulge the secrets of the confessional. This custom of secrecy is traceable in the fourth and fifth centuries, but was made binding by Innocent III (1198–1216), and its violation by a priest makes him subject to the severest penalties that can be inflicted by the Church. See PRIVILEGED COMMUNICATION.

CONFESSION (Lat. *confessio*, from *confiteri*, to confess, from *com-*, together + *fateri*, to acknowledge; connected with *fari*, Gk. *φῆναι*, *phēnai*, to speak). In law, a purely voluntary declaration made by one who has committed a crime that he is guilty of the offense with which he is charged. If made before a magistrate or in the court of judicial proceedings before a court, such confessions are "judicial"; if made anywhere else, they are "extrajudicial." An entirely voluntary confession is admissible in evidence; but not so if procured through inducements, threats, promises, or hope of escape or favor. A prisoner's confession when the *corpus delicti*, i.e., the essential element of the crime, is not otherwise proved is not sufficient to warrant conviction. It is generally provided by statute that a confession in a capital case must be corroborated by evidence in order to justify a conviction. Whether an alleged confession is admissible, as having been made voluntarily, is a question for the court; what weight it is entitled to is a question for the jury. See ADMISSION; also CRIMINAL LAW, and consult the authorities referred to there.

CONFESSION (the tomb of a confessor or martyr). In church architecture, the recess, ambulatory, or chapel beneath the central altar, containing the relics of the saints, and corresponding to the subterranean tombs of the martyrs in the catacombs over which churches were erected. Such confessions gradually grew in size between the fourth and seventh centuries, until they developed into the crypt (q.v.).

CONFESSION, AUGSBURG. See AUGSBURG CONFESSION.

CONFES'SIONAL (ML. *confessionalis*, relating to confession, from Lat. *confessio*, confession). The seat, recess, or booth in which the priest sits to hear confession in a Roman Catholic church. These booths are distributed throughout the interiors of churches, in the nave and aisles, and are slight, closed structures made of wood. The confessional commonly has a door in front, through which the priest enters, and an opening on one or both sides, like a small window, with a grating of wire or zinc, for the penitents to speak through as they kneel.

CONFESSION AND AVOIDANCE. Pleadings are said to be in confession and avoidance, in common-law practice, when they expressly or by a reasonable implication admit the allegations of the pleading to which they are interposed, and show some justification or excuse which will deprive them of the legal effect of supporting the plaintiff's claim of a right to recover. The admission must be sufficiently comprehensive to give color to the matter adversely alleged, i.e., must show it to be prima facie, or apparently, true. Any pleading after the declaration may be by way of confession and avoidance of the last pleading of the opposite party. Thus, if the defendant should plead a release by plaintiff, the latter might in his replication admit that he gave a release, but allege that it was obtained from him by coercion or fraud. This might be denied by the opposite party, and then the cause would be at issue. See PLEADING.

CONFESSION D'UN ENFANT DU SIÈCLE, kôN'fĕ'syôN' dụ nẽN'fẽN' dụ syĕk'l', LA (Fr., The Confession of a Child of the Century). A work of fiction by Alfred de Musset (1836), founded upon the author's love affair with George Sand.

CONFESSION OF JUDGMENT. A method of allowing judgment to be entered against a person upon his acknowledgment in proper form that a claim is, or is about to become, due and owing to another, and consenting that the latter may enter judgment for the amount named. A judgment thus obtained is equally valid and binding as though it had been secured by legal process. While the weight of advantage is with

the person obtaining the judgment, in the saving of the time and expense of litigation, this device may also be of advantage to the debtor in saving him the annoyance and costs of suit involved in the ordinary process. It is commonly resorted to in cases where the debtor desires to prefer a certain creditor and give him the priority over other creditors and the additional security which a judgment affords.

It differs from *cognovit* (q.v.) in the fact that it may be made without the institution of an action, and in the further fact that it is generally limited to debts, in the usual sense of that term, and is not available for the liquidation of claims founded on torts. However, as intimated above, a confession of judgment may be equally valid for a claim not yet accrued, as for future advances.

In a few of the States of the United States it is customary to give a promissory note at the time of its inception the form and character of a confession of judgment, whereby the holder of the note is authorized at maturity, or at a specified time thereafter, to enter up judgment thereupon without further process. This extension of the principle is not, however, generally favored. See JUDGMENT; WARRANT OF ATTORNEY.

CONFESSIONS, LES, lā kôn'fĕ'syôn' (Fr., The Confessions). A remarkable autobiography, of great frankness and dramatic strength, by Jean Jacques Rousseau, composed between 1766 and 1770. The work, in 12 books, was published in 1781 and 1788, after the author's death, contrary to his intention of suppressing it during the lifetime of the persons referred to in it.

CONFESSIONS OF AN ENGLISH OPIUM-EATER. A work by Thomas De Quincey (1821). It describes the effects of opium eating and is an example of impassioned prose which has few, if any, equals in English.

CONFESSIONS OF SAINT AUGUSTINE, THE. A work by St. Augustine in 13 books, of which the first 10 are autobiographical. The remaining three are exegetical, treating the first portion of Genesis.

CONFIDENTIAL COMMUNICATION. See PRIVILEGED COMMUNICATION.

CON'FIRMA'TION (Lat. *confirmatio*, from *confirmare*, to strengthen, from *com-*, together + *firmare*, to make firm, from *firmus*, firm). A sacramental rite admitting to the status of a communicant and to full membership in the church. It follows baptism and in the ancient church the rite was administered immediately after baptism, which is still the custom in the Greek and African churches. In the Roman Catholic church, for the last 300 or 400 years the bishops have interposed a delay of seven years after infant baptism; the Anglican church has no specific rule as to age, 14 to 16 years being the custom. Lutherans administer the rite at about the same age. The ceremony in the Eastern and Western churches consists in the imposition of hands by a bishop or the anointing with oil blessed by a bishop, accompanied by an invocation of the Holy Ghost as the Comforter and Strengthener. The effect of the rite as administered through the bishop is held to be the bestowing of the Holy Ghost to dwell within the individual and to work in a "seven-fold gift"—wisdom, understanding, counsel, might, knowledge, godliness, and holy fear. Both in the English and Lutheran churches the ceremony is made the occasion of requiring from those who have been baptized in infancy, a renewal in their own persons of the baptismal vow made for them by their godfathers and godmothers, who are thereby released from their responsibility. The Lutheran church, having no bishops, administers confirmation through its parochial clergy. In Western theology confirmation is held to be one of the seven sacraments. In the Roman Catholic church in its administration unction and the sign of the Cross are used, in addition to the imposition of hands. See SACRAMENT.

CONFIRMATION. In old English law, a conveyance of an estate or right in lands to one who has the possession or some estate therein, the object being to confirm or render sure and indefeasible an estate which, but for such confirmation, is defective and voidable. It may be illustrated by the case of a disseisin, where the disseisee, or rightful owner, confirms the estate of the disseisor, who is in adverse possession of the land, vesting an absolute and indefeasible title in the latter. A confirmation was effected by deed and was nearly equivalent to a release (q.v.), by which it has been superseded. The confirmation is now, as a separate mode of conveyance, obsolete, though the term is still sometimes employed to describe the release of an outstanding claim to land to the party in possession. See CONVEYANCE.

CONFISCATION (Lat. *confiscatio*, from *confiscare*, to confiscate, from *com-*, together + *fiscus*, basket, treasury). The forfeiture of lands or goods to the crown or state. At Rome *bona confiscata* were goods forfeited to the Emperor's treasury. Though sometimes employed in English and American law as synonymous with *forfeiture* for crime, confiscation is, at common law, a term of much more limited signification, and should probably be confined to the cases of the seizure by the crown of waifs (*bona waviata*), or goods scattered by a thief in his flight, and of goods found in the possession of a felon and disclaimed by him. See ESCHEAT; FORFEITURE.

Under certain statutes, however, the state exercises the right to confiscate goods for violation of law, as in case of false entries of goods under customs and other revenue laws, and for violations of excise and internal revenue laws of the United States. The seizure and sale of real property by the state for nonpayment of taxes is a similar proceeding.

Both international law and municipal law recognize the right of the sovereign authorities to confiscate the goods of an alien enemy found within the state, but the right is in fact seldom exercised in modern times.

CONFLICT OF LAWS. An opposition or contrariety between the laws of different jurisdictions affecting the rights of the same individual. In the decision of legal controversies every court regularly applies its own law (*lex fori*), i.e., the law prevailing within its jurisdiction; but exceptionally, and not infrequently, justice requires, and the domestic law itself authorizes, the application of foreign law. The cases in which the question arises whether domestic or foreign law should be applied are figuratively termed cases of conflict; and "conflict of laws" is the title under which it is customary to set forth the rules by which such conflicts are adjusted. Because this branch of the law has been of international growth, and because the rules applied in the different nations are in the main similar, it is sometimes described as "international private law." Apart from other objections, this term is too narrow; for

the rules in question apply not merely to conflicts between the laws of different nations, but also to conflicts between different cantonal or provincial laws within the same state, and to conflicts between the laws of different states within the same empire or federation. To a New York court, the law of New Jersey is as foreign as that of England or of France, and the same rules govern its application. This branch of modern law was developed on the continent of Europe in the Middle Ages; and because in the later Middle Ages all purely local rules, whether of written or unwritten law, were termed "statutes" (*statuta*), it was first known as the doctrine of "collision of statutes." It took form as a body of judicial usages, but its development was largely controlled by the writings of leading jurists. Until the sixteenth century the authoritative writers were Italians (Bartolus and Baldus); from the sixteenth to the eighteenth century they were French (Dumoulin, D'Argentré, Bouhier, and Boullenois), or Dutch (Burgundus, Rodenburg, P. and J. Voet, and Huber); in the nineteenth century the most important treatises were those of the American, Story, and the German, Savigny.

Since Savigny, the effort of writers and of courts has been to determine by what local law each class of legal relations is properly governed. A substantial consensus exists on many of the chief points. 1. Domestic relations are regularly governed by the law of the husband's and father's domicile (*lex domicilii*). 2. Succession, whether testamentary or *ab intestato*, is governed by the law of the decedent's domicile. On the continent of Europe this is generally true of the entire estate, including realty; in England and in the United States the law of the domicile governs the distribution of the personalty only. On the Continent the law of the domicile also governs the liquidation and division of a bankrupt's estate; in England this is true as regards the personalty only. Everywhere the property relations of husband and wife (at least as regards personalty) are governed by the law of the matrimonial domicile. 3. Real property (except on the Continent in the above cases) is governed by the law of the jurisdiction in which it lies (*lex rei sitæ*). 4. Movable things, except in the cases mentioned above, are also governed by the law of the site, i.e., rights vested by the law of the site are respected everywhere and are not affected by the removal of the thing to another jurisdiction. 5. Contractual obligations are governed, so far as the relations between the creditor and the debtor are concerned, partly by the law of the place where the contract was concluded (*lex loci contractus celebrati*), and partly by the law of the place where the obligation is to be performed (*lex loci solutionis*). As regards transfers or assignments of the creditor's claim, however, the law governing transfers of personal property may prevail over the proper law of the contract; and claims (choses in action) regarded as assets of an estate will regularly be governed by the law of the creditor's domicile in the cases mentioned in No. 2.

Back of all these matters lie questions of *capacity*, (*a*) to take and hold property, real or personal, and (*b*) to act with legal result. The question of capacity to take and hold property rarely arises to-day except as regards corporations. This capacity is primarily determined by the law of the state in which the corporation was created; but it may be diminished or denied by the law of the place in which the property is situated. Questions of capacity to act are similarly determined as regards corporations, i.e., capacity must be accorded by the law of the state in which the corporation was created and also by the law of the state in which the corporation attempts to act. As regards natural persons, capacity to transmit property by will or to marry is generally determined by the law of the domicile; capacity to transfer personal property or to contract debt by the law of the place of the act (*lex loci actus*). In the United States, however, capacity to marry is governed by the law of the place of marriage. The sufficiency of the forms observed in legal acts is usually determined by the *lex loci actus*.

As regards wrongful acts, no action of tort can be maintained unless the act was wrongful (tortious) by the law of the place where it was done; and it is commonly held that it must also be tortious according to the law of the place where suit is brought (*lex fori*).

It should be noted that some European countries (Italy, Belgium, and Germany) substitute for the law of the domicile, in nearly all cases, the law of the state of which the person is (or in the case of a deceased person, was) a citizen or subject (*lex ligeantiæ, lex civitatis*); but the dominant theory makes allegiance immaterial in matters of private law.

To all the above rules there is a series of exceptions.

Foreign law cannot be applied unless the domestic law permits its application. If the domestic legislator has expressly declared that a certain law is to govern all cases coming before the domestic courts, or if the purpose of the law would be thwarted by admitting exceptions, foreign law cannot be applied. Nor will foreign law be applied when its application would contravene the settled policy of the domestic law.

Finally, foreign law is applied only as regards questions of right, not as regards remedies—a rule which, properly construed, means that rights are to be enforced according to the methods prescribed by the domestic law.

Foreign law is said to be a question of fact. According to the sounder theory, this does not mean that it is a question for the jury; it means that the court is not bound to know foreign law and may demand evidence concerning it.

A foreign judgment is recognized as conclusive on the facts and on the law when it is a final judgment on the merits of the case by a competent court, i.e., by a court having jurisdiction. Whether the foreign court had jurisdiction is, however, a question which the domestic court will investigate, and will decide on principles of general jurisprudence, i.e., according to its own view of those principles.

Consult: Story, *Commentaries on the Conflict of Laws* (8th ed., ed. by Bigelow, Boston, 1883); Wharton, *Treatise on the Conflict of Laws;* or, *Private International Law* (2d ed., Rochester, 1905); Westlake, *Treatise on Private International Law* (3d ed., London, 1890); Dicey, *A Digest of the Law of England with Reference to the Conflict of Laws*, American notes by J. B. Moore (Boston, 1896). Two valuable German treatises, those of Savigny and Bar, have been translated into English—the former by Guthrie, under the title *Private International Law* (2d ed., Edinburgh, 1880), the latter by Gillespie.

under the title *International Law, Private and Criminal* (Boston, 1883).

CONFLUEN'TES. The ancient name of Coblentz (q.v.).

CONFORM'ITY (Fr. *conformité*, from Lat. *conformis*, like, from *com-*, together + *forma*, shape). In geology, the succession of two series of sedimentary or igneous strata in regular order uninterrupted by any interval of erosion. Such strata are said to be "conformable" and bear evidence of having been laid down continuously and without disturbance. The term "conformability" is frequently used as a synonym of conformity. See UNCONFORMITY; GEOLOGY.

CONFRONTÉ, kŏn-frŏn'tâ; *Fr. pron.* kŏN'-frŏN'tâ' (Fr., confronted). In heraldry, a term which signifies "facing or fronting one another." It is the same as "combatant." See HERALDRY.

CONFUCIUS, kŏn-fū'shĭ-ŭs (Latinized form of Chinese *Kung-fū-tze*, the Master Kung) (c.551–478 B.C.). The most famous of all the sages of China. He was born in the State of Lu in the province which is now called "Shan-tung," where his descendant of the seventy-sixth generation is now living. His lineage is traced by native tradition to Hang Ti, one of the early mythical rulers of China, although Confucius himself was the son of a soldier, Kung Shuh-Liang Heh, who was in command of the District of Chow. China at that time had the feudal system of government, very similar to feudal Europe. When a very old man, over 70 years of age, Heh wedded Chang Tsai in 552, and about a year later had as a son the future sage. When Confucius was but three years old, he lost his father, but the boy was most carefully educated by his mother, though the family was left in reduced circumstances, and trained according to the highest ideals of China. At an early age he gave evidence of his exceptional abilities and his regard for ancient customs, while his thirst for learning was insatiable. When only 17 years old, he was manager for a wealthy landowner of Lu, and two years later he married. As in the case of other great teachers, however, notably Buddha, and, later, Rama Krishna of India, Confucius seems to have been little adapted for family life. He had one son, who was born in 531, and, it would seem, two daughters. After four years he parted from his wife, but doubtless with unbroken friendship on both sides. The real life work of Confucius began when he was 22, and from that time till his death, a period of 51 years, he led the life of a teacher, migrating frequently from place to place. His conduct on the death of his mother, which occurred in 527, is significant as showing the bent of his mind. With a filial devotion very rare at that epoch, he erected a large mound over her as she lay in the same grave with his father, and for 27 months remained in entire seclusion. This time was probably not wasted. Doubtless his meditations during this period of mourning had considerable influence on his subsequent teachings. The effect of his rigorous observance of the ancient ceremonial custom of mourning for parents had an effect on all who knew him and heightened their respect for his words. By the time Confucius had reached the age of 30 he had formulated to his own satisfaction the tenets of his philosophy. In 517 he gained his first pupils of importance, and he was enabled to visit Lo-yang, the capital of the district, where he had an interview with Lao Tsz', the founder of Taoism. On his return to Lu in the following year he found the city in a state of anarchy, and on the expulsion of the Governor, who was his friend, Confucius retired with the ex-official to the neighboring State of Tsi. Here, however, he could not find a congenial home, for his teachings were not acceptable, and he returned to Lu, where he remained for the next 15 years, carefully keeping himself aloof from all factional strife and never slackening his devotion to his mission. At last his moral worth received its reward, and at the age of 52 Confucius was appointed Governor of Chung-tu, and this honor was followed by others higher still. Through the machinations of the Governor of Tsi, however, who was afraid that the wise counsels of Confucius would make the State of Lu supreme in China, the influence of the master in Lu was so weakened that he left the country after four years, at that time 56 years of age. For 13 years he wandered from place to place and did not return to Lu until in his sixty-ninth year. His last years were spent in well-earned retirement; but they were full of sorrow, marked by the deaths of his son and his two best-loved disciples, Yen Hui and Tsz' Lu. In 478 the teacher himself died, saddened by the fear lest he had failed to accomplish his mission. Herein he was wrong. The news of his death spread throughout the land and called attention anew to his purity of life and teaching, so that the name of Confucius has ever since been the highest and most honored in the land to which he gave his lifelong devotion. By the irony of fate he was deified after his death, and, like Buddha, Confucius, who had little belief in the supernatural, became a divinity.

Confucius was, as he himself said, not a reformer, but a conserver. This is strikingly evident in his services to the literature of China. Although he is sometimes called a prolific author, he was in reality but a careful though voluminous editor, and he may, if this is clearly understood, be termed the founder of Chinese literature. Thus he established the canon of four of the "five classics," the *Shih Ching*, or 'Book of Poems,' the *Li Ching*, or 'Book of Rites,' the *I Ching*, or 'Book of Changes,' (originally a cosmological work), and the *Shu Ching*, or 'Book of Historical Documents,' for which Confucius is said to have composed a preface, although merely a list of books which the *Shu Ching* once contained now remains. His one independent work, apart from his apothegms which were recorded by his disciples, is the *Ch'un Tsin*, or 'Spring and Autumn.' This is an extremely dry annalistic history, very meagre in content and information, and altogether untrustworthy as a source of Chinese history, and records the events in the State of Lu from 721 to 480 B.C., a period of 242 years.

Confucius was in no real sense of the word a religious teacher, in fact, did not concern himself with religion. His doctrines were entirely ethical and political. His attitude towards the supernatural may be summed up in his own words: "Respect the gods! but have as little as possible to do with them," and it is recorded that he spoke but seldom of four subjects—marvels, feats of strength, rebellions, and spiritual beings. In harmony with this attitude he expresses no opinion concerning the immortality of the soul. He inculcates ever the duty, which he himself had observed so faithfully, of honor to parents and of obedience to temporal power. In this way the individual becomes absorbed

in the family and the family in the state, which was regarded by Confucius as the highest concept on earth. For a state to be prosperous, mercy and all other virtues are necessary, and these qualities are to be manifested by the entire body of citizens. If the emperor was a wicked man and a bad ruler, Confucius taught that he need not be obeyed and that his subjects were free to depose him, which principle the Chinese many times afterward put into effect. The teachings of Confucius are, consequently, wholly worldly in character, and the dry maxims in which he expressed his views are permeated by a utilitarian philosophy which is devoid of any touch of idealism. His attitude towards women is the one generally current in the Orient. Metaphysical speculation, like religious investigation, is absent from his system, which sums up its principles in the five cardinal virtues—humanity, uprightness, decorum, wisdom, and truth. Confucius may perhaps be said to be China incarnate in his lack of originality; but with his devotion to the practical and his moral principles as patriot, sage, and teacher, he ranks among the foremost men that the world has ever seen. The most valuable account of Confucius is contained in the *Lun Yü*, or 'Philosophical Dialogues,' which record his conversations, while the *Ta Hsüeh*, or 'Great Learning,' and the *Chung Yung*, or 'Doctrine of the Mean,' are important sources for the study of his system of philosophy.

As illustrations of the maxims of Confucius, the following characteristic ones may be cited: Learning without thought is labor lost; thought without learning is death of the mind. Riches and honor are what men desire; yet, except in accordance with right, they should not be enjoyed: poverty and degradation are what men dread; yet, except in accordance with right, they should not be avoided. What the superior man seeks is in himself; what the small man seeks is in others. The foundation of all good is the virtue of individual men. Confucius also enunciated the Golden Rule, although in negative terms, as follows: "What ye would not that others should do unto you, do ye not unto them." Despite the negative form of this maxim, it is to all intents and purposes closely parallel to the Golden Rule as given by Christ.

Some one has said that, no matter of what religion a Chinese may be, he is ex officio a Confucianist. This is as true of China to-day as it ever was in the past. At present there is a strong movement going on in Republican China to have Confucianism recognized as the state religion. It is significant to note that Yuan Shï-K'ai revived the former Imperial ceremonies in connection with the veneration of the master. This was done, however, not for the purpose of sanctioning Confucianism exclusively, but by such means to hold the people in the present period of change true to the old standards of ethics and morality.

Consult: Plath, *Confucius und seiner Schüler Leben und Lehren* (Munich, 1867–74); Von der Gabelentz, *Confucius und seine Lehre* (Leipzig, 1888); Haug, *Confucius der Weise Chinas* (Berlin, 1880); Dvorak, *Chinas Religionen*, Band i, *Confucius und seine Lehre* (Münster, 1895); Legge, *Life and Teachings of Confucius* (London, 1887); Douglass, *Confucianism and Taoism* (ib., 1879); Huan Chang Chen, *The Economic Principles of Confucius and his School* (New York, 1911). For the original sources, Legge's translations of the *Lun Yü*, *Ta Hsüeh*, and *Chung Yung* in the first volume of his *Chinese Classics* (Hongkong and London, 1861) should be consulted as of the first importance. The same scholar's translations of the *Texts of Confucianism* (comprising the *Shu Ching*, *Hsiao Ching*, *I Ching*, *Li Ching*, and portions of the *Shih Ching*), vols. iii, xvi, xvii, xviii of the *Sacred Books of the East* (Oxford, 1879–95), are also of value.

CONFUSION (Lat. *confusio*, a mixing together, from *confundere*, to mingle or mix together, from *com-*, together + *fundere*, to pour, pour out) OF GOODS. The intermingling of the goods of two or more several owners so as to be indistinguishable. This may occur voluntarily, or by agreement of all the parties concerned—as in the common case of the deposit of grain in a common storage elevator; or accidentally, as when, in case of fire or shipwreck or innocent mistake, goods are inextricably mingled together; or the confusion may be malicious and willful, as when one person takes gold belonging to another and throws it into the melting pot with his own. In the first two cases the law adjusts the rights of the parties by making them tenants in common of the mixture, in the proportion of their respective contributions thereto, and, where the portions confused are of unequal value, in the proportion of their respective values. In the case of a willful confusion, however, the common law originally adopted the stringent rule of giving the entire mass to the innocent party, and this principle would still be applied in some common-law jurisdictions. The present tendency, however, in England as well as in the United States, is to adopt the milder rule of the Roman or civil law, either making the parties tenants in common of the mixture, as in the other cases referred to, or permitting the innocent party to recover the value of his share at the time of the confusion. Compare ACCESSION. Consult Schouler, *Treatise on the Law of Personal Property* (Boston, 1896).

CONGAREE (kŏn'gȧ-rē') **RIVER.** A river of South Carolina, formed by the junction of the Broad and the Saluda rivers, 1 mile northwest of Columbia (Map: South Carolina, D 3). It flows southeast and, joining the Wateree, forms the Santee. It is 60 miles long and navigable to Grandby, 2 miles below Columbia. Above that city it furnishes considerable water power.

CONGÉ D'ÉLIRE, kŏN'zhȧ' dȧ'lēr' (Norman-French, Fr., permission to elect). The name given in England to the King's warrant or permission to a dean and chapter of a cathedral to proceed to the election of a bishop or archbishop to a vacant see. Since the passing of the Statute 25 Hen. VIII, c. 20, with the exception of short periods in the reigns of Edward VI and Mary, the congé d'élire has always been accompanied by a letter missive from the King, mentioning the person to be elected by name, so that in reality it is an appointment by the crown. If the dean and chapter delay the election beyond 12 days, the appointment is effected by letter patent from the crown; if they elect another than the person named, they incur the penalties of a præmunire, i.e., loss of civil rights, forfeiture of their goods, and imprisonment during the royal pleasure. The same penalties are imposed upon any bishop or archbishop who neglects to assist in the consecration and investment of a bishop so elected, within 20 days after the royal announcement of his

elèction. Consult Stephen, *Commentaries*, vol. iii (London, 1886).

CONGEN'ITAL DISEASE (Lat. *congenitus*, born with, from *con-*, together + *gignere*, to beget). A term used to denote any disease with which an infant enters the world. Congenital diseases may be acquired from the mother during pregnancy or during the act of delivery. In the former class belong syphilis and, according to some authorities, smallpox. The latter class is to be separated into two subdivisions: (1) diseases obtained by infection from the parturient canal of the mother, as syphilis, gonorrhœa, septic peritonitis, purulent ophthalmia, and pyæmia; (2) conditions due to accidents occurring during delivery of the infant, such as asphyxia, atelectasis (unexpanded lungs), and cephalhæmatoma (tumor of the scalp containing bloody fluid). Infants may also develop an acute fatty degeneration as well as tumors and malformations of various kinds before birth.

CONGER, kŏŋ'gĕr (Lat., from Gk. γόγγρος, *gongros*, conger), or CONGER EEL. A marine eel (*Leptocephalus conger*) of the family Leptocephalidæ, having the form of the typical eels, but no scales. The head is pointed and the mouth deeply cleft. The teeth in the outer series of either jaw are placed closely together so as to form a cutting edge. The dorsal fin commences much nearer the head than in the fresh-water eel and is confluent with the anal around the tail. The conger grows to a length of 8 feet and a weight of 25 or 30 pounds and is almost cosmopolitan. "Congers feed chiefly by night and prey upon crustaceans, cuttles, and various kinds of fish. . . . Their favorite resorts are either hollows or crevices in the rocks or sandy bottoms, in which they can bury themselves; and in such situations they are sometimes left by the ebbing tide. The flesh of these eels is of a highly gelatinous nature and is said to be largely employed in soups." American fishermen usually call them sea eels. Several Oriental species are known; and the name is sometimes applied to other similar fishes, as those of the genus *Synaphobranchus*. The conger passes through a metamorphosis, "the young being loosely organized, transparent, and band-shaped, with a very small head. The body grows smaller with age owing to the compacting of the tissues." This larval form was mistakenly described as a different genus, *Leptocephalus*. This name, being the older, has displaced the long-used generic term *Conger*. It is estimated that the number of eggs deposited by a single female in an aquarium has been as great as three and a third millions. See EEL; and Plate of EELS, CONGERS, AND MORAYS.

CONGER, EDWIN HURD (1843–1907). An American politician and diplomat, born in Knox Co., Ill. He graduated in 1862 at Lombard University (Galesburg, Ill.) and at the Albany Law School in 1866 and in the latter year was admitted to the bar of Illinois. He served in the Federal army during the Civil War, was brevetted major, and in 1868 set up as a stockman and banker in Iowa. From 1885 to 1891 he was a member of Congress, and at the close of the latter year was appointed Envoy Extraordinary and Minister Plenipotentiary to Brazil. In 1898 he was transferred to the embassy in China. He was the only representative of a foreign power who, during the siege of Peking from June 28 to Aug. 14, 1900, was able to send a communication to his government, and he took a leading part in the peace negotiations after the siege. In 1905 he was appointed Ambassador to Mexico, but resigned the same year.

CONGES'TION (Lat. *congestio*, accumulation, from *congerere*, to carry together, from *com-*, together + *gerere*, to carry). An abnormal increase of blood in the vessels, due to increased pressure in the arteries or obstruction to the emptying of the veins. Emotion or exercise, by causing the heart to beat more rapidly; alcohol, or other drugs, by expanding the arteries as well as stimulating the heart; local irritation, by cold, a blow, or a burn—may cause congestion of the active variety, with the production of a rosy color. A tight garter, a stooping posture, or the swelling of a finger from injury may cause passive congestion by obstructing the veins, in which case the color of the congested part is bluish or purple. In certain diseases in which the heart becomes weak and circulation fails, as pneumonia, typhoid fever, and septic conditions, the blood gravitates to the most dependent parts of the body, and "hypostatic congestion" of the lungs, liver, and skin results mechanically. Congestion occurs during many diseases.

CONGLETON, kŏŋ'g'l-ton. A market town of Cheshire, England, beautifully situated on the Dane River and the Macclesfield Canal, about 26 miles south of Manchester (Map: England, D 3). Its chief industries consist of manufactures of silks, ribbons, and towels, salt, furniture, nails, iron and brass work, and stone. Coal is mined, and there are a number of corn mills. Pop., 1901, 10,706; 1911, 11,309. Congleton appears in the *Domesday Survey*, and received a charter from the Earl of Lincoln in the thirteenth century.

CONGLETON, HENRY BROOKE PARNELL. See PARNELL, HENRY BROOKE.

CONGLOM'ERATE (from Lat. *conglomeratus*, p.p. of *conglomerare*, to roll together, from *com-*, together + *glomerare*, to roll into a ball, from *glomus*, ball). A sedimentary rock (commonly called "pudding stone") composed of pebbles cemented together by finer-grained rock material. The cementing substance is commonly lime carbonate or an oxide of iron; quartz also occurs and makes a very hard, durable material which is sometimes used for millstones. The millstones quarried in the United States are mainly a quartz conglomerate that is found along the eastern slopes of the Appalachians from New York to North Carolina. Conglomerates form along shores, and the pebbly beaches which are now forming will, when consolidated, produce conglomerates. Since conglomerates can form only in shallow water (where the force of the waves is sufficient to move pebbles), their occurrence within the strata of the earth's crust indicates an encroachment of the sea upon the land. Such an encroachment occurs during and after a subsidence of the land beneath the sea, when deposits of sediment are laid down. Conglomerates, therefore, generally lie at the base of geological formations and serve to separate these formations from one another. They are also common in glacial deposits, consisting of pebbles that have been carried along by the ice and sorted out by the streams that issued from the glaciers. Such conglomerates are

characterized by angular and subrounded pebbles that may show striations and groovings from abrasion while they were transported along the bed of the glacier. Glacial conglomerates are cemented usually by calcium carbonate in the form of calcite or aragonite.

CONGO, kŏn'gō, or **KONGO** (from the African tribe of *Mosicongo*). The largest and, excepting the Nile, the longest river of Africa and one of the great rivers of the earth. It drains most of Central Africa west of long. 32° E., from lat. 8° N. to 13° S. It is formed by the union of two great streams—the Lualaba, from the south, whose sources on the Zambezi water parting are believed to be the ultimate fountain head of the Congo; and the Luapula (also known as the Kuvua) from the southeast, which drains Lake Bangweolo, the ultimate source of this branch of the Congo being the Chambezi affluent of Bangweolo. The drainage system is extended farthest east, however, by the eastern tributaries of Lake Tanganyika which send the waters of a large area within 500 miles of the Indian Ocean, to Tanganyika, through the Lukuga outlet to the Congo and down that river to the Atlantic. Below the Lukuga several minor streams are received by the Congo, mainly from the eastern side, until, at the equator, in long. 24° 30′ E., at a point about 80 miles below Stanley Falls, the Congo is joined by the Lomami, which has a parallel course on the west. Eastward of this point the Congo begins its great bend towards the west. About 60 miles below the entrance of the Lomami, the Aruwimi enters the Congo from the east, and still farther downstream there join at intervals from the north the rivers Rubi, Mongala, Ubangi (all great rivers, the Ubangi being larger than any rivers of Europe excepting the Volga and Danube), Sanga, Likuala, and Alima, besides smaller streams; and from the south the Lulonga, Ruki, and Kasai. Below these, throughout the lower 500 miles of the river's course, only small tributaries are received. Between the Atlantic and the great lakes the basin of the Congo consists of three successive terraces. The three zones thus formed are: 1. A narrow coastal strip lying between the sea and the coastal ranges; its elevation rises gradually to about 2000 feet. 2. A vast central zone of depression lying between the Atlantic ranges and Mitumba Mountains. 3. An elevated zone at the eastern end of the basin. It is in the descent from the plateau near the west coast that the chief impediments to navigation occur. The basin has a great tropical forest extending east of the Congo between the Aruwimi and the Nile system, and there are large forest areas to the south of the northern bend of the Congo; but the greater part of the country consists of rolling savannas interspersed with timber. The river is navigable for ocean steamers from its mouth to Matadi, a point about 100 miles upstream, where navigation is interrupted by falls and rapids; and also by steamboats from Stanley Pool to Stanley Falls, for a distance of over 1000 miles farther. The length of the navigable waters of the Congo system is estimated at about 6000 miles. The completion of the Matadi Railroad, about 250 miles in length, from Matadi to Stanley Pool, around the falls and rapids which interrupt navigation between those points, has placed the middle course of the river in communication with its estuary, and the building of the railroad between Stanleyville (at Stanley Falls) and Ponthierville, 75 miles, finished in 1906 and circumventing the upper rapids, has extended steam transportation 200 miles farther up the river. The Congo has a length of about 3000 miles and drains an area of more than 1,400,000 square miles.

CONGO, BELGIAN, formerly CONGO FREE STATE. A colony founded in 1882 as an independent state under the sovereignty of King Leopold II of Belgium. Annexation to Belgium was accomplished by means of the Treaty of Nov. 28, 1907. Situated approximately between long. 12° and 30° E. and between lat. 14° S. and 6° N. (Map: Africa, G 5), it is bounded on the north by French Equatorial Africa and the Anglo-Egyptian Sudan, on the east by British East Africa, German East Africa, and Northern Rhodesia, on the south by Northern Rhodesia and Portuguese West Africa, and on the west by Portuguese West Africa, the Atlantic, and French Equatorial Africa. The boundaries of the colony, with the Congo and Ubangi rivers on the west, and Lakes Tanganyika, Moero, Albert Edward, and Albert, on the east, are all well defined, and the area is estimated at about 909,654 square miles.

The surface of Congo is a depressed plateau basin, which is unbroken by mountains except in the western part near the Atlantic, and in its southeastern corner. It rises on its borders to elevations of 6000 feet and more. The river valleys are occupied by dense forests, while the remainder is composed of wooded savannas and arable land. The chief river is the Congo (q.v.), which, together with its tributaries, drains nearly the entire territory. The climate is hot and moist, but the annual white death rate has been reduced to about 6 per cent. The normal temperature ranges from 60° to 90° F., and not infrequently an exceedingly hot day is followed by a chilly night. The climate in the interior is not so injurious to Europeans as that of the coast region. In the elevated portions of the colony, like the Katanga District, the climate is perfectly salubrious.

The flora of Congo is very rich and varied, the forests being full of rubber vines (one tree) and others yielding gums and resins. Among the cultivated plants are the coffee, cotton, yam, papaw, pineapple, cassava, corn, rice, peanut, sweet potato, banana, bean, tobacco, sorghum, and Kafir corn. The fauna includes the elephant, hippopotamus, buffalo, antelope, chimpanzee, and crocodile. Elephants are numerous, but their slaughter is now prohibited, and ivory exports, which are abundant, are chiefly from earlier accumulations by the native population. Iron, tin, and coal occur in many localities, while copper is confined to rich deposits in the southeast (Katanga). Gold is also found there. Katanga is the richest mineral region in the colony.

The natural agricultural possibilities of the colony are very great, but the unhealthful climate, which practically forbids white immigration, largely retards systematic agricultural development. Rubber, gathered for many years under compulsion by the natives, is the chief product and export. The development of the rubber industry is shown by the following export figures (special trade): 1898–1900, 3,725,596 kilos annual average, valued at 27,941,970 francs; 1901–05, 5,396,775 kilos annual average, valued at 44,055,539 francs; 1906–10, 4,246,595 kilos annual average, valued at 43,367,338 francs; 1910, 3,416,784 kilos, 51,015,-

649 francs; 1911, 3,401,970 kilos, 34,426,896 francs; 1912, 34,519,000 francs. In the general trade the export of rubber was valued at 50,424,000 francs in 1911; 76,030,000 in 1910; 45,183,000 in 1901; 20,655,000 annual average, 1896–1900; 2,260,000 annual average, 1887–90. Other products for export are palm kernels and palm oil, white copal, cacao, coffee, corn, kola nuts, raw gold, ivory, raw copper, and rawhides.

Transportation facilities are mainly provided by the Congo and its several navigable tributaries. The Congo is interrupted in its lower part, from Matadi to Leopoldville, a distance of about 200 miles, by a series of rapids—a great obstacle to direct communication between the interior of the country and the Atlantic. To obviate this difficulty, a railway line about 249 miles in length was constructed between Matadi and Stanley Pool, and opened for traffic in 1898. Above the rapids the river is navigable for 1000 miles to Stanleyville. A railroad, 75 miles long, was completed (1906) around Stanley Falls to Ponthierville, making possible combined rail and steamboat communication from the mouth of the Congo over 2000 miles up the river. The following lines were in operation Jan. 1, 1912; Matadi to Stanley Pool, 249 miles; Stanleyville-Ponthierville, 78; Kindu-Kongolo, 221; Rhodesian frontier to Elisabethville, 163 (total line, 171); Boma-la Lukula, 50; total, 767. On the same date there were under construction the Lualaba-Tanganyika line, 168 miles; Elisabethville-Bukama, 101; and la Lakula-Thela, 35; total, 304. From Stanleyville, which is approximately 1300 miles above the mouth, a railway is being constructed (through an agreement with Great Britain) to the Nile River, where it will connect with a railway line (near Lado) which extends to the Red Sea, thus giving a complete steam transportation line across Africa. Another line is to connect the navigable waters of the upper Congo with Lake Tanganyika and another to connect with the Cape to Congo Railway about 2300 miles north of Cape Town. During 1912 and 1913 construction work progressed rapidly. The government and private enterprises run many steamers on the upper Congo. The total number of miles of waterway by river and lake in the Congo is estimated at 9500. There is steam communication regularly each fortnight with Antwerp, and also frequent communication with other European ports. The length of telegraph line in 1912 was 1145 miles, with 1680 miles of wire and 19 offices; wireless stations, 5; post offices, 50.

The development of the trade is shown in the following table, the values being given in francs:

	GENERAL		SPECIAL	
	Imports	Exports	Imports	Exports
1896–1900*	24,711,700	29,771,839	21,508,728	35,202,947
1901–05*	25,188,780	61,512,080	21,099,779	52,015,706
1906–10*	33,574,203	76,960,388	26,443,836	56,662,785
1910	43,979,142	95,598,698	36,846,508	66,602,295
1911	58,385,060	78,955,399	48,632,877	54,052,426
1912	61,864,000	83,465,000	53,868,000	59,125,000

* Annual average.

The principal articles of export in the special trade are rubber (27,941,970 francs, annual average, 1898–1900, 34,426,896 francs in 1911, and 34,519,000 in 1912), ivory (5,135,727 and 5,683,468 francs, in 1912, 5,552,000 francs), white copal (9628 and 3,348,317), raw gold (140,394, annual average, 1901–05, and 3,119,050 in 1911), palm kernels (1,297,331, annual average, 1898–1900, and 2,878,674 in 1911), palm oil (738,227 and 1,731,898), raw copper (4,112,000 francs in 1912), cacao (4365 and 895,543), coffee (10,044 and 3218), etc. The chief articles of import are textiles, boats and machinery and parts for boats, arms and munitions, machinery including rolling stock and materials for railway, telegraph, and telephone construction, beverages, foodstuffs, metals, etc. Belgium furnished in the special trade imports valued in 1912 at 35,785,000 francs, and received exports valued at 53,814,000 francs; United Kingdom, 5,670,000 and 558,000; Germany, 4,079,614 and 614,000; France, 1,141,000 and 23,000. Imports of the United States of the products of Belgian Congo are drawn from Belgium and other European countries, and are chiefly India rubber and ivory; the exports direct to Congo were in 1913 $14,905. There is an import duty of 10 per cent ad valorem on arms, ammunition, and salt, and of 6 per cent on all other articles, with the exception of machinery and agricultural implements, which were admitted duty free from 1892 to 1896, and since then have been liable to a duty of 3 per cent. There is an export duty on rubber and several other articles. The principal ports are Boma (the seat since 1906 of the American Consul General) and Banana, whose combined oversea shipping, entered and cleared, was over 1,600,000 tons in 1911, over one-half being Belgian. The coasting trade is small.

The Congo Free State was annexed by Belgium as the colony of the Belgian Congo by Treaty of November, 1907, approved by the Belgian Parliament in August and by the King in October of the following year. The colony is administered by a governor-general at Boma, assisted by several vice governors-general. In Brussels there is a colonial minister, who presides over the Colonial Council of 14 members, of whom 8 are appointed by the King and 3 chosen by the Senate and 3 by the Chamber of Deputies. The colony is divided into 15 administrative districts. The colonial budget is voted annually by the Belgian Parliament. The colony has a force of native troops, recruited by conscription and volunteering, amounting to about 18,000 men. The budget for 1913 showed estimated revenue of 40,418,100 francs and estimated expenditure of 50,933,064 francs; the public debt in 1912 was 151,222,200 francs.

The population has been variously estimated, but is believed to be about 15,000,000. At the beginning of 1912 whites numbered 5465, of whom 3307 were Belgians. The inhabitants are mostly of the Bantu race. The Azandés, a superior native people, are found in the northeast, and there are many Pygmies along upper Congo affluents. Among the numerous "stations" in the Belgian Congo are: Boma, the capital, situated on the Congo, about 50 miles from its mouth, and the centre of a large trade; the port of Banana, with an excellent harbor; Matadi, terminus of the railway at the foot of the Congo Rapids; Leopoldville, Stanley Pool, Coquilhatville, Basoko, and Stanleyville. Missionary work, though without financial support from the state, is being actively and successfully carried on at 138 missions. The instruction is educational as well as religious. The missions coöperate with the state, which has

formed colonies where agricultural and other instruction is given.

Ethnology. The natives of the Congo represent two principal physical types, Pygmies and Negroes. The Pygmies are sprinkled over the greater part of the equatorial forest, often living in close contact with dominant Negro peoples, e.g., with the Bakuba in the southwest and the Mangbettu in the northeast. The Negroes represent considerable differences of a minor character, and in the northeast an infusion of Ethiopian and Nilotic blood is practically certain. Linguistically the Bantu stock predominates, but in the northeast Sudanese languages are spoken. Up to date there is no satisfactory evidence of distinct Pygmy tongues, the Pygmies having adopted the speech of neighboring Negro populations.

Finds during recent years indicate the one-time existence of a Stone age, but throughout the Congo the art of smelting iron is now practiced with great skill. Industrial development reaches its high-water mark in the Kasai District, where the Bakuba (Bushongo) produce wonderfully beautiful wood carvings and pile cloth of plushlike appearance. Pottery and basketry likewise flourish. Economically the Congolese Negroes are mainly dependent on hoe agriculture, though hunting and fishing are not unimportant. In several regions, notably among the Bakongo, Balunda, Bakuba, and Mangbettu, powerful monarchies have developed in historical times. The social organization of the Congolese is imperfectly known; the Bakuba (Bushongo) have maternal descent, while the Azande are reported to be patrilineal. Religious practices and beliefs seem to centre in fetishism. See Colored Plate of DARK RACES OF AFRICA with the article AFRICA.

History. The Congo Free State was established as a neutral independent sovereignty. In 1876 King Leopold II of Belgium had organized, with the coöperation of the leading African explorers and the support of several European governments, the International African Association (q.v.), for the promotion of African exploration and colonization. In the following year Henry M. Stanley called attention to the Congo country and was sent there by the association, the expense being defrayed by Leopold. By treaties with native chiefs rights were acquired to a great area along the Congo, and posts were established. After 1879 the work was under the auspices of the Comité d'Etudes du Haut Congo, which developed into the International Association of the Congo. This organization sought to combine the numerous small territories acquired into one sovereign state and asked for recognition from the civilized governments. On April 22, 1884, the United States government, having decided that the cessions by the native chiefs were lawful, recognized the International Association of the Congo as a sovereign independent state, under the title of the Congo Free State, and this example was followed by Austria-Hungary, France, Germany, England, Italy, the Netherlands, Portugal, Russia, Spain, and Sweden. The international conference on African affairs which met at Berlin, 1884–85, determined the status of the Congo Free State. By the Act of the Conference, signed Feb. 26, 1885, the Congo Free State was declared neutral and open to the trade of all nations, the Powers reserving for 20 years the right to decide as to the taxation of imports; the navigation of the Congo and its affluents was to be free, under the supervision of an international commission; religious freedom and equality of treatment of all settlers were guaranteed; and war was declared upon the slave trade. The United States refrained from ratifying this act, on the ground that it would thereby be committed to certain international engagements. The new state was placed under the personal sovereignty of Leopold II, who by will, four years later, bequeathed it to Belgium. On July 31, 1890, the territories of the Congo Free State were declared inalienable.

The central government of the state was located at Brussels and was constituted by the King of Belgium and a Secretary of State, the latter being head of the departments of Foreign Affairs, Finance, and the Interior. The King's power was not limited by a constitution, but was somewhat circumscribed by the General Act of Berlin of 1885 relative to the organization of the Congo Free State. The direct administration was in the hands of a governor-general at Boma, assisted by a vice governor-general. According to the agreement of 1890, between Belgium and the Congo Free State, the former obtained the right of annexing the latter after a period of 10 years. In 1901 the question of annexation came up before Parliament, and the right of annexation was reserved to the King alone.

In accordance with the tariff reservation in the Act of 1885, the international conference at Brussels in 1890 authorized the Congo Free State to levy duties on certain imports in order to provide the needed revenue. By the Treaty of 1891 the United States established relations with the Congo Free State, providing for commercial intercourse and a consular system and for the arbitration of any dispute under the treaty. Several separate treaties with the European states having colonial possessions in Africa adjoining the Congo Free State have defined its boundaries. There is a difference of opinion in regard to the success of the work done by Belgium on the Congo. Largely as the result of agitation carried on in England, a Belgian commission of inquiry was dispatched to Boma in the fall of 1904 to examine into the charges of oppression, cruelty, and restriction of trade brought against the Belgian authorities. The report of the commission presented November, 1905, showed the existence of widespread evils. The natives were the victims of a crushing system of forced labor imposed with particular severity in the territories under the control of the concessionary commercial companies. Nevertheless forced labor, though in a modified form, was declared necessary for the salvation of the country. The native police employed by the companies were guilty of revolting atrocities, and armed punitive expeditions were carried on by the companies against recalcitrant villages. The great decrease in population was ascribed to the prevalence of epidemics, the sleeping sickness, and emigration following on the extinction of the ivory trade. Reforms were declared necessary, but at the same time the commission pointed out the civilizing work that had been accomplished. Cannibalism was practically extinct, and human sacrifice was rare. Towns had been built on the banks of the Congo, and railroads and telegraph lines extended. A reform committee subsequently drew up a

scheme of reforms, part of which was accepted by King Leopold and issued as decrees in June, 1906. The most important of these reforms were the following: The natives were secured in the possession of their lands, but the right of determining rightful possession rested exclusively in the state. The natives were allowed to pay taxes in kind or in labor, forced labor not to exceed 40 hours per month. A native less than 14 years old could not be compelled to sign a contract for more than two years of ordinary work and for more than three years of domestic service. Punitive expeditions, which could be ordered only by the Governor-General or the district commissioners or their representatives, were not to be resorted to until after persuasion had been tried, and in no case was the direction of police or military operations to be confided to natives. The King also denied the right of any foreign power to interfere in the administration of the affairs of the Congo State. This settlement, however, soon proved unsatisfactory. The reforms were but partly enforced; several native riots occurred; consular and missionary reports continued to insist that the natives were treated with great cruelty. The British government became restive, and even the United States Senate urged President Roosevelt to use his good offices. As a result of this agitation, the semi-independence of the Congo Free State came formally to an end, and on Nov. 29, 1910, a treaty was signed ceding the Congo Free State outright to Belgium. It now became Belgian Congo. New reforms were started by the Belgian government; the natives were permitted to pay their taxes in silver instead of rubber; their right to the free disposition of the fruits of the soil was recognized, and in the meantime railway construction was undertaken on a large scale, a considerable portion of which was already completed by 1913. The thoroughness of the Belgian reforms has been much questioned. The Congo Reform Association as late as 1912 insisted that Belgium, despite the assurances of the colonial administration, was simply playing with reform and pointed out, in a memorial to the British government, the great reduction in population, the social and economic misery in the Congo. Sir Edward Grey stated, however, that no action could be taken, and in 1913 the association formally disbanded, leaving Belgium without any organized opposition.

CONGO FREE STATE. See CONGO, BELGIAN.

CONGO PEA. See PIGEON PEA.

CONGO RED. See COAL-TAR COLORS.

CONGO SNAKE. A small, eel-like amphibian (*Amphiuma means*), with very small two-toed legs, and eyes covered with skin. It is found in the rice fields of the Southern States, where it is much feared by the common folk. It is wholly harmless and burrows in mud in search of fishes, snails, and insect larvæ. It lays under logs, etc., a mass of eggs, which have a firm, transparent skin, and are connected by cords into a string; these seem to be guarded and kept moist by the mother (*Bulletin United States National Museum*, No. 34, p. 220). The *Amphiuma* is remarkable as being the only salamander possessing a voice; when angry or excited, it gives a clear whistle. See AMPHIUMA.

CON'GREGA'TION (Lat. *congregatio*, from *congregare*, to flock together, from *com-*, together + *gregare*, to flock, from *grex*, herd). An assembly; generally a religious assembly; in its most ordinary sense, an assembly of Christians met in one place for worship. (See CHURCH.) In the Roman Catholic church it often designates a sort of board of cardinals, prelates, and divines to which is intrusted the management of some important branch of the affairs of the church. For example, the *Congregation of the Index* examines books and decides on their fitness for general perusal. (See INDEX.) The *Congregatio de Propaganda Fide* consults as to the advancement of the Roman Catholic religion throughout the world. (See PROPAGANDA.) The *Congregation of Relics* inquires into the genuineness of supposed relics. *The Congregation of the Holy Office* takes cognizance of heresies, etc. (See INQUISITION.) The *Congregation of Rites* regulates the festivals and offices of new saints.

Religious order and *religious congregation* are terms which, though used promiscuously, have respective definite meanings. A religious order is one approved by the Pope as such and in which solemn vows are made. A religious congregation is one which is approved mediately or immediately by the Pope, but in which the vows made are called simple. See VOW.

CON'GREGA'TIONALISM. A term used in two significations at present. It designates a system of church organization and government, democratic in form, and rightly claimed by a great family of religious bodies, of which that popularly called "Congregational" is only one. In this usage the word appropriately describes the polity of the Baptists, the River and the Plymouth Brethren, the Christians, the Disciples of Christ, the Unitarians, and the Hebrew synagogues. It properly describes the organization of considerable groups of Adventists, American Lutherans, and less numerous religious communions, as well as of those churches specifically called by the Congregational name. But the term "Congregational" is employed no less appropriately in a second signification, to denote a particular group of churches in Great Britain, the United States, Canada, and Australia, which are "Congregational" in their

government and "Evangelical" in their type of Protestant doctrine, and stand in recognized relations of denominational fellowship one with another within the bounds of the respective countries of their location and to some extent in international fraternal union. In this sense it is proper to speak of the Congregational denomination of the United States, or of England and Wales.

The Congregational polity, in its modern history, had its origin in the Reformation age, and was due to the belief that the Bible contains an authoritative revelation of the will of God concerning church organization, no less than a God-given revelation of religious truth. In working out the details of the Congregational system its early expounders conceived that they were simply reproducing the divinely appointed model of the Apostolic churches. Few modern Congregationalists hold, however, that the minutiæ of church government are matters of revelation, or that any one form of church organization was divinely appointed for all times, countries, and stages of civilization; though Congregationalists generally believe that their polity embodies the broad scriptural principles of fraternal equality, individual responsibility, and full-rounded independent Christian manhood. They deem it, also, peculiarly consonant with the democratic tendencies and high individual intelligence of modern civil society. As indicated in the name, Congregationalism believes the basic element in the visible organized Church to be the local congregation of Christian disciples. It holds that congregation competent to designate its own officers, admit members to communion, discipline the erring, state its faith in language of its own choosing, and order its worship as seems best suited to its need. Each local congregation modern Congregationalism regards as a democracy, where affairs of concern are decided by the votes of the membership, normally under the moderatorship of the pastor—if there be a pastor in office. Like all democratic bodies, however, a Congregational church makes large use of committees, which report results rather than processes for the consideration of the body as a whole and act as the executive arms of the congregation.

Congregationalism holds to the autonomy of the local church. It rejects the judicial system of Presbyterianism, or the supervision of any form of episcopacy, as an undue interference with the rights of the local body. But Congregationalism in America, and increasingly in Great Britain, rejects pure independency. Though one church or body of Christians has no judicial authority over another, each owes fraternal counsel to its neighbors, and no act of large importance in any single congregation should be done without seeking the advice of the representatives of sister churches. Illustrated in various ways in different countries, mutual responsibility and helpfulness are distinguishing features of the Congregational polity.

The Local Church. The local church is held by Congregationalists to be a company of professed disciples of Christ, who have some intelligent acquaintance with Christian truth and personal experience of the saving work of Christ. Hence admission to church membership is based on evidence of intelligent determination to lead a Christian life. Such a company of Christians is knit together into a church by the covenant which they make with God and one with another, to live as those who have God for their Father and Christ for their Saviour, and to join in the worship, seek the welfare, and submit to the discipline of the particular local body of believers of which they are members. In early Congregationalism, and in American practice to the present day, this covenant, which each local congregation may express in whatever way seems best to it, was written; in Great Britain written covenants are now rare. In addition to a written covenant it is usual for American Congregational churches of the present day to have a brief confession of faith, assent to which is required of would-be members. Such local confessions, though not unknown, are unusual in Great Britain. Examination of candidates for membership as to their knowledge of Christian truth has prevailed since the beginnings of Congregationalism; but the local confession of faith, though occasionally exemplified in New England during the seventeenth and eighteenth centuries, attained general use in America during the doctrinal discussions of the opening years of the nineteenth century. Each local church is free to express its faith in its own language, and such confessions, like the examination of candidates for church membership, have steadily tended towards greater catholicity and simplicity. While Congregationalism recognizes no creed statement as binding on a local church save that which the church may itself adopt, Congregationalists have never hesitated, in their representative gatherings, to adopt confessions of faith. These have the value of a testimony to the common faith of the churches and have never been regarded as creed tests. Thus, the exiled London Congregationalists put forth a confession in 1596; the Cambridge Synod, representing the churches of New England, approved the doctrinal parts of the Westminster Confession in 1648. Ten years later, a meeting representative of the Congregational churches of England put forth a modified form of the Westminster Confession, known, from the place of their assembly, in the Savoy, in London, as the "Savoy Declaration"; and meetings of the delegates of the Massachusetts churches in 1680, and of those of Connecticut in 1708, set their approval, save for slight changes, on this work of the Savoy Synod. The "Congregational Union of England and Wales" put forth a statement of "Principles of Religion" in 1833; the "National Council of the Congregational Churches of the United States" adopted the "Burial Hill [Plymouth, Mass.] Declaration" in 1865; in 1883 a commission appointed by the National Council three years before reported a creed that has had wide acceptance among American Congregationalists; and in 1913 the National Council adopted a brief creed prepared by a special commission appointed by the National Council in 1910.

Doctrinal Position. The doctrinal position of early Congregationalism was that of general Puritan or Presbyterian Calvinism. It was not on doctrinal grounds that the founders of New England left their homes. They were wholly one theologically with the Puritan party of the English Civil War, with which they and the English Congregationalists were alike associated. Historically considered, American and English Congregational theological develop-

ment has been along Calvinistic lines; but, as in other Protestant bodies, the peculiar problems of seventeenth century debate have ceased to arouse interest. Calvinistic and Arminian interpretations of the way of salvation, as far as there is present significance in either interpretation, are regarded as alike acceptable. The doctrinal position of modern Congregationalism is that common Protestantism which is known as "Evangelical." Its ministry and churches, as a whole, however, while holding broadly to the system of Christian doctrine characteristic of historic Protestantism, have been more disposed in recent years than many Protestant bodies to welcome the new interpretations of Christian truth, and of its sources, which current theological discussions in Europe and America have presented.

Officers and Support. Early Congregationalism, following what was believed to be the Scripture model, held that a completely organized local church should have five classes of officers—a "pastor" and a "teacher," both of whom should preach and administer the sacraments; a "ruling elder," who should aid in church discipline; "deacons," to care for the poor and assist at the Lord's Table; and "widows," to aid in nursing among the sick. But little of this elaborateness of organization survived the end of the seventeenth century, and by that time the officers of a Congregational church had become reduced almost universally to a pastor and several deacons. The development of the nineteenth century added to these officers in practically every church a clerk, a treasurer, and a Sunday-school superintendent; and, in churches of size, a "prudential committee," to serve with the other officers as advisory to the pastor. Recently the order of deaconess was adopted. Assistant pastors are becoming efficient aids to the pastoral service. Since the cessation of teachers and ruling elders, the pastors and assistant pastors have been generally the only paid officers of Congregational churches. In the earliest Congregationalism everywhere, and in English Congregational practice always, the expenses of the church were met by some form of voluntary payment or by the rental of sittings in the place of worship. Modern American Congregationalism employs these voluntary methods exclusively. But during most of the Colonial history of New England the intimacy of relationship between church and state was such that church expenses were assessed upon the taxable property of all inhabitants not specially exempt, and such assessments were collectible like any other taxes. This continued the practice in Connecticut till 1818 and in Massachusetts until 1834. When there was but one church in a township, its pecuniary affairs were settled in the meeting of the legal voters of that township. Where two or more churches existed in the township, it was subdivided territorially into districts for voting and tax raising, known as "societies," "parishes," or "precincts." The New England feeling that there should be no taxation without the consent of those taxed led, during the last third of the seventeenth century, to the assumption by the legal voters, by whom the minister's salary was assessed and paid, of a right to concur in or reject the choice of a minister by the membership of the church, and established a dual system of entrance to the local pastorate, the election of the church requiring the confirmation of the "society." In the general usage of New England, and to some extent in other parts of the United States, this system has survived the loss of the right of public taxation for ecclesiastical purposes and prevails at the present time. The ownership of the buildings used by the church and the determination and payment of the salary to its minister remain under the control of a voluntary local legal business corporation, admission to which is secured by election, by renting sittings in the church edifice, or in a variety of ways; and this corporation, still known as the "society" or "parish," has a concurrent authority in the choice of a minister. English practice has known nothing of this institution; and outside of New England the temporalities of the church have been largely placed in the hands of trustees chosen by the membership of the church, or the church itself has held title to its property and administered its pecuniary affairs. Even in New England the "society" is falling into disuse in many places, the church itself securing the incorporation permitted by statute and assuming all the rights previously shared with the "society."

Worship. Early Congregationalism, in its sharp reaction from the imposition of a written liturgy, characteristic of the days of Elizabeth and the Stuarts, went to the extreme of rejecting all written liturgy as unscriptural. Modern Congregationalism entertains no such hostility, and a considerable degree of modification of the public services of Congregationalism, by responsive reading, united repetition of the Lord's Prayer and the Apostles' Creed, and development of the musical aids to worship, has taken place in recent years. In accordance with its fundamental principle of local autonomy, Congregationalism recognizes the full right of each local church to order its worship as it sees best. But, whatever minor modifications have taken place, Congregational worship remains essentially nonliturgical. It makes the sermon central, and includes, as it has always done, the elements of preaching, free prayer, the reading of the Word of God, and singing. Till about the middle of the eighteenth century in America, and in the early Congregational practice of Great Britain, only metrical translation of portions of Scripture were deemed appropriate to be sung in public worship, and the aid of musical instruments was rejected till about the same period; but since then full freedom in the use of hymns and musical aids has prevailed.

Fellowship between the Churches. While each congregation is autonomous, Congregationalism believes that it is the duty of each local church to consult neighboring churches in matters of importance. This feature of Congregational practice has attained a larger development in America than in England and is chiefly manifested by the "advisory councils," which American Congregationalism has employed since the time of the first settlers on New England soil. Though given a place in the theoretic exposition of early English Congregationalism, the "advisory council" of America has no exact counterpart in modern British usage. Such ecclesiastical acts as the formation of a church, the settlement or dismissal of a pastor, and the consideration of cases of discipline from which quarrel and division have

resulted, are judged by American Congregationalism to demand the advice of neighboring churches. At the request of a church, or of a party in a divided church, the representatives of neighboring churches meet in an "advisory council"—a temporary body assembled to consider the particular case. Its composition depends solely on the "letter missive" of invitation, and may be drawn from a distance, though usage regards a council, the majority of the membership of which is not from the vicinage, as seriously irregular. Its authority is not judicial, but its advice is seldom disregarded. On completing its work, an "advisory council" is dissolved, and the minutes are left with the church with which it met. No member of the council is taken from the church which calls it. The council does not report to any other organization than the church which asks its advice.

Early Congregationalism in England and America recognized the desirability of gatherings representing the communion as a whole in occasional important exigencies. Thus, the ministers and delegates of the New England churches gathered at Cambridge, Mass., in 1637, when the supposed heresies aroused by Mrs. Anne Hutchinson were considered, and again in 1646–48, when English religious politics induced them to formulate their system of church government in the "Cambridge Platform." The favor which English Congregationalists experienced from Cromwell induced an assembly at the Savoy Palace, London, in 1658, which set forth Congregational faith and practice. Besides these general gatherings, meetings of representatives of colonies and districts were held as necessity required. Massachusetts called such assemblies to consider the proper recipients of baptism in 1662 and to find remedies for the declining state of religion in 1679–80. Connecticut summoned such a gathering in the height of the excitement of the "Great Awakening" in 1741. Less formal and distinctly ecclesiastical, but nevertheless a factor of weight in the religious life of the Province, was the annual convention of ministers of Massachusetts which met, from early Colonial days, at the time of the May election.

Permanent Organizations. Local stated meetings of ministers for discussion of matters of ecclesiastical interest existed in England under the Commonwealth, and were introduced into Massachusetts in 1690. By 1705 there were five such associations in the Province, by which candidates for the ministerial office were examined and licensed; and in 1708 the system was extended to Connecticut, where, besides these local gatherings, an association representative of the whole Colony was formed that has assembled annually from 1709 to the present time. Similar State bodies were organized in Vermont in 1795, in Massachusetts in 1803, in New Hampshire in 1809, and have since extended everywhere where Congregationalism has gone in America. These State bodies are now prevailingly designated "conferences." Minor local meetings, often coextensive with county lines in their constituency, are universal in American Congregational practice. During the early part of the nineteenth century, however, the feeling was strongly manifest that these stated meetings, which were at first of ministers only, should be made really representative bodies by the admission of delegates of churches. This has been universally accomplished. In each State, and in most subdivisions of States, where Congregationalism is organized, there is now a body meeting for discussion at least once a year, and composed of the pastors and the elected delegates of the churches. The State bodies are designated prevailingly "conferences," and the smaller local bodies "associations." The pressing questions of the decade previous to the Civil War led to the gathering at Albany, in 1852, of the first convention representative of American Congregationalism as a whole that had assembled since 1648; and at Boston, in 1865, a similar representative council was held. In 1871 the "National Council of the Congregational Churches of the United States" was formed. This body has since met regularly every third year, and can hold special sessions at any time at the request of any five State organizations of churches. By a change in its constitution, adopted in 1913, it now meets biennially. Its membership is elected by the local and State bodies into which the churches are grouped, and the number of delegates chosen is proportionate to the number of local churches and of the communicants in the bodies by which they are appointed. The decisions of the National Council, like those of the smaller bodies into which the Congregational churches of the United States are grouped, are not mandatory or judicial; but the free discussion of matters of common concern, their investigation by competent committees, and the recommendation of courses of action by vote, have much weight with the churches. The churches of Canada are not constituents of this National Council, but are organized in the "Congregational Unions" of "Ontario and Quebec" and of "Nova Scotia and New Brunswick."

In the United States Congregational churches are normally united by permanent representative bodies of three kinds, the larger in a true sense superior to the smaller: (1) the local "association"; (2) the State "conference"; (3) the National Council. The usage of Great Britain is much less developed. Independency is more nearly the condition of English than of American Congregationalism. As has been pointed out, English Congregationalism does not have the "advisory council." But an approximation to the American system of mutual responsibility and helpfulness exists in the county and district associations, in which English Congregational churches have long been grouped. Some of these bodies may have come down from the days of the Commonwealth; but their modern development began in Hampshire in 1781, whence they rapidly extended over England. By these "associations," or unions, the good standing of Congregational churches and ministers is certified, church advancement is superintended, and denominational fellowship variously expressed. Besides their coöperation in these local associations, the Congregational churches of Great Britain are federated in two larger bodies—the Congregational Union of Scotland, organized in 1813, and the Congregational Union of England and Wales, formed in 1832. The semiannual meetings of the last-named assembly are the most influential events in modern English Congregational life.

The sense of mutual fellowship characteristic of modern Congregationalism has its further illustration in the formation of an "Interna-

tional Congregational Council," representative, by appointed delegates, of the churches of all lands into which Congregationalism has penetrated. Its first meeting was held at London in 1891, its second at Boston in 1899; and its third in Edinburgh in 1908.

Missionary Agencies. The benevolences of Congregationalism have called into being a large number of denominational agencies. In the United States organized home missions began with the formation of the Missionary Society of Connecticut in 1798 and the Massachusetts Missionary Society in 1799. Similar local societies have been formed in the States where Congregationalism is strongly represented, and they serve as auxiliaries to the national Congregational Home Missionary Society, founded in 1826, to which a large share, not merely of the westward extension of Congregationalism, but of the maintenance of the feebler churches in the older States, is due. A second society by which Congregational effort is carried forward within the territory of the United States, Porto Rico, Alaska, and the Hawaiian Islands, is the American Missionary Association, organized in 1846 by antislavery sympathizers, which now maintains an extensive educational and evangelistic work, chiefly among the negroes of the South, but also among the mountain whites, the Indians of the West, the Eskimos of Alaska, and the Chinese of the Pacific coast. The Congregational Education Society, founded in 1815, has for its work the strengthening of schools and colleges in the newer portions of the land, and the assistance of worthy and needy candidates for the ministry. The work of the Congregational Church Building Society and of the Congregational Sunday-School and Publishing Society is indicated by their titles. Congregational foreign missionary effort reaching forth from the United States is under the direction of the American Board of Commissioners for Foreign Missions, founded in 1810, and now carrying on work in India, Turkey, China, Japan, Micronesia, Africa, Austria, Spain, and Mexico. By an agreement effected in 1913 with these national Congregational societies for home and foreign work, the membership of the National Council is the majority membership of each, and all are under the supervision of a commission of that council. In Great Britain the work of home missions is under the charge of the Congregational Church Aid and Home Missionary Society, and that of foreign evangelization of the London Missionary Society, founded in 1795. Canadian Congregationalism has its own Foreign Missionary Society.

Theological Seminaries. In order to secure a proper training for their ministers, the early New England Congregationalists established Harvard and Yale, and the course of instruction in both of those institutions of learning was long regulated by the design of equipping men for the ministry. But by the first quarter of the eighteenth century the ordinary course of collegiate instruction was increasingly felt to be inadequate for the needs of ministerial training, and the result was the foundation at Harvard, in 1721, of the Hollis professorship of divinity, and the beginnings of a similar professorship of divinity at Yale in 1746—a professorship that was not fully established there until 1755. Even more influential in the ministerial training of the eighteenth century than the instruction of these professors was the custom, which grew into increasing prominence as the century went on, of taking a few months of training supplemental to the college course, under the guidance of some eminent pastor, before applying for ministerial licensure. Such household theological seminaries were presided over by many of the prominent pastors of New England; and among such instructors Jonathan Edwards, of Northampton, Mass.; Joseph Bellamy, of Bethlehem, Conn.; Charles Backus, of Somers, Conn.; and Nathaniel Emmons, of Franklin, Mass., were conspicuous.

The immediate cause of the establishment of theological seminaries, in the modern sense of the term, in America was the passage of Harvard College to the control of the party soon to be known as Unitarian, in 1805. Deprived thus of control of their chief seat of ministerial training, the conservative Congregationalists of eastern Massachusetts began at once to plan for separate schools of theological instruction. Two independent designs for the establishment of a theological seminary—the one begun by representatives of the older type of New England Calvinism, and the other by men of the Edwardean sympathies—were happily combined, after much effort, in 1808, and resulted, in September of that year, in the establishment of Andover Theological Seminary, at Andover, Mass. Conspicuous in the teaching force of this institution, from its foundation to his resignation in 1846, was Leonard Woods, its first professor of theology; while Moses Stuart, from 1810 to 1848, was eminent for his services in the study of the Old Testament and in introducing the theology of Germany to the knowledge of American students. Even more conspicuous as a theological leader at Andover was Edwards A. Park, who taught in the institution from 1836 to 1881 and, from 1847 to the year last mentioned, occupied its chair of theology. Andover Seminary under its first instructors occupied a theological position which represented a union on broad and generous lines of the various shades of conservative New England opinion, in opposition to the Unitarian movement of its day. Under Professor Park the Edwardean theology was even more emphasized and developed. For 30 years past Andover has been distinguished by a cordial welcome to the newer phases of theological discussion, especially as developed in Germany. In 1908, while preserving its name and separate organization, it removed to Cambridge and entered into affiliation with Harvard University.

A second theological seminary was that established at Hampden, Me., in October, 1816, but which was removed to Bangor, Me., in 1819, where it has since continued, and from which place it takes its name. Its most eminent theological instructor in the past was perhaps Enoch Pond, whose connection with it extended from 1832 to 1870.

In 1822 the corporation of Yale College—now Yale University—carried into execution a plan which had been entertained by them for a considerable time, by establishing a department of theology in the college, which has since been known as "Yale Divinity School" and is a coordinate department of Yale University. Its first professor of theology, from its foundation to his death in 1858, was Nathaniel W. Taylor,

whose type of doctrine, though belonging essentially to the historic Edwardean school, yet modified the characteristic teachings of that school in some particulars to such an extent as to receive the name "New Haven theology," and subjected its author to much criticism from the stricter representatives of the Edwardean party. Other conspicuous teachers of the Yale Divinity School have been Eleazar T. Fitch, from its foundation to 1852; Samuel Harris, professor of systematic theology from 1871 to 1895; Timothy Dwight, professor of New Testament Greek from 1858 to 1886, and president of Yale University from 1888 to 1900; and George Park Fisher, its professor of Church history from 1861 to 1901.

The differences of opinion awakened by the theology of Nathaniel W. Taylor, already alluded to, led to the foundation of a school at East Windsor, Conn., in 1834, then called the "Theological Institute of Connecticut," but much better known as "Hartford Theological Seminary" since its removal to Hartford in 1865. Its founder and first professor of theology was Bennet Tyler, who occupied its most conspicuous chair until 1857. The chief leader among its later instructors was Chester D. Hartranft, who became president in 1888, and under whom its curriculum and equipment were greatly developed. He was succeeded in 1903 by William D. Mackenzie.

Almost contemporary with the founding of the Hartford Seminary was the establishment of a theological department in connection with Oberlin College, opened under the title of Oberlin Theological Seminary, in 1835. Its most distinguished instructors have been Charles C. Finney, the eminent revivalist, whose services to it continued from 1835 to 1875; and, since his death, James H. Fairchild, who was connected with Oberlin College, as an instructor in various departments, from 1838 to his decease in 1902, and held the office of president from 1866 to 1889. Oberlin is at present distinguished by the hearty reception there given to the theology of the Ritschlian school.

The growing needs of the Middle West led to the organization, in 1854, and to the complete establishment in 1858, of Chicago Theological Seminary, an institution prevailingly conservative in its broader evangelical type of theology, of which it has long been a leader in a region which looks to Chicago as its centre. Conspicuous in its teaching force have been Samuel C. Bartlett, its professor of biblical literature from 1858 to 1877, when he became president of Dartmouth College; Franklin W. Fisk, its professor of sacred rhetoric from 1859 to his death in 1901; and George N. Boardman, its professor of theology from 1871 to 1893.

The Pacific Theological Seminary was established at Oakland, Cal., in 1869, and is now located at Berkeley, in the same State. The youngest of the Congregational theological schools was organized at Atlanta, Ga., in 1901.

The Congregational College of Canada was founded in 1830 as a "Congregational Academy," at Toronto, and was removed to Montreal in 1864, where it is now located as a theological school in affiliation with McGill University.

It will thus be seen that, of the American Congregational theological seminaries, Yale and Oberlin are departments of a university or a college; three others, Andover, Montreal, and Pacific, are affiliated or in close geographical connection with universities; and four, Bangor, Hartford, Chicago, and Atlanta, are independent foundations. While some of them originated in doctrinal discussion, and they still represent in several instances somewhat dissimilar points of view, the general tendency of modern Congregational development has been to an increasing similarity in doctrinal position and in methods of instruction, so that good fellowship instead of schism exists among all these theological seminaries at the present time.

In Great Britain, as in America, theological education has long commanded the attention of Congregationalists. Soon after the passage of the Toleration Act by the English Parliament, Congregational and Presbyterian Dissenters about London established a "fund" to aid feeble churches and to educate candidates for the pastoral office (July 1, 1690). The union of representatives of the two polities proved but temporary, and in 1695 the "fund" was divided, and a "Congregational Fund Board" organized. This board still exists. By its influence, and that of eminent Congregationalists like Philip Doddridge, many "academies" and "colleges" were organized in the eighteenth century. These had at first the twofold object of training an educated ministry and of providing a general education for lay students who were debarred from university privileges by their "dissent" from the Establishment. To some extent these two aims are still sought by the Congregational "colleges" of Great Britain; but with the removal of disabilities from the pathway of Nonconformists who are seeking a general education these "colleges" are laying increasing and in some instances exclusive emphasis on ministerial training. They correspond to the "theological seminaries" of the United States.

The Congregational "colleges" of Great Britain, at the present time, are the following: 1. *New College*, London, tracing its origin to 1696 and now affiliated with the University of London. 2. *Western College*, Bristol, founded as the Western Academy, in 1752. 3. *Yorkshire United Independent College*, Bradford, dating from 1756. 4. *Cheshunt College*, Cheshunt, founded by the Countess of Huntingdon at Talgarth in 1768 and now affiliated with the University of London. 5. *Hackney College*, founded by Rev. Matthew Wilks and Rev. George Collison at Hackney in 1803 and now at Hampstead. It is affiliated with the University of London. 6. *Lancashire Independent College*, Manchester, founded at Blackburn in 1816. 7. *Mansfield College*, Oxford, founded as Spring Hill College at Birmingham in 1838 and greatly strengthened by its significant re-establishment at Oxford in 1886. 8. The *Congregational Institute*, Nottingham, opened in 1861. 9. The *Congregational Memorial College*, Brecon, combining a number of institutions, the oldest of which dates from 1755, and giving special attention to Welsh students. 10. *Bala-Bangor Independent College*, Bangor, dating from 1843 and largely Welsh in its constituency. 11. The *Theological Hall of the Congregational Churches in Scotland*, Edinburgh, tracing its origin to the Congregational Academy founded at Glasgow in 1811. Congregational students are also supported by separate funds in the *Presbyterian College* at Carmarthen.

History. Modern Congregationalism had its rise in the discussions consequent upon the Eng-

lish Reformation. Its earliest advocates may properly be described as forming the radical wing of English Puritan Protestantism. But, besides the characteristics which they shared with the Puritan party, they showed several non-Puritan peculiarities. They denied the existence of a national church; they denied that church membership belonged to all baptized inhabitants of the kingdom; they held each church competent to regulate its own affairs. These peculiarities are so similar to those of the Continental Anabaptists, that some influence from Anabaptist sources in Congregational beginnings seems probable; but the dissimilarities existing between Anabaptists and Congregationalism are so considerable that this influence must have been indirect and unconscious. The founders of Congregationalism thought they were simply reproducing the system of the New Testament. Though a church essentially Congregational in organization existed in London as early as 1567, Congregationalism first came to significance in the work, and especially in the writings, of an erratic but earnestly reformatory young graduate of Cambridge, Robert Browne. Convinced that reforms such as he desired were unattainable within the Establishment, Browne organized a Congregational church at Norwich in 1580 or 1581. Compelled to seek refuge in Holland, Browne put forth several tracts in 1582, in which he urged the duty of immediate separation from the Church of England—a characteristic that gave the name "Separatists" to these early Congregationalists. He also set forth Congregational principles with great distinctness. By 1587 Congregational preaching by Henry Barrowe, a London lawyer, and John Greenwood, like Barrowe a Cambridge graduate, had gathered a following in London and brought upon its teachers and disciples the hostility of the government. The organization of a Congregational church in London, in 1592, was followed by the martyrdom, by hanging, of Barrowe, Greenwood, and John Penry, in 1593, and the exile of the greater portion of its membership, who found a home in Amsterdam, with Francis Johnson as their "pastor" and Henry Ainsworth as their "teacher."

Meanwhile a movement to secure earnest Puritan preaching was begun, about 1590, in the country region of their residence some 150 miles north of London, by Richard Clyfton, rector of Babworth, and William Brewster, a layman of Scrooby. Ecclesiastical opposition deepened the movement into Separation, and it was stimulated by the coming of Rev. John Robinson, in 1604, and Rev. John Smyth, apparently the following year. Churches were formed on the Congregational model at Scrooby and Gainesborough, probably in 1606, though the year is uncertain. Governmental opposition compelled both to seek refuge in Holland, and that of Scrooby, with Robinson as its "pastor" and Brewster as its "ruling elder," found a home at Leyden in 1609. Thence a minority of its membership emigrated to New England in 1620, founding Plymouth, now in Massachusetts, in December of that year. Here the Separatist colony passed through severe struggles successfully under the leadership of Brewster, and with William Bradford, Edward Winslow, and Myles Standish as its foremost men in civil affairs.

This "Pilgrim" emigration, as it was called, was Separatist, and Plymouth Colony numbered only about 300 in population by the close of its first decade. It would have amounted to little had it not been unexpectedly and greatly reinforced. The policy of Charles I impelled English Puritans to seek new homes across the ocean, and the result was the establishment of a Puritan colony at Salem in 1628. Acquaintance with the Plymouth Separatists brought recognition of the large similarity of their views, and when a church was formed at Salem, in 1629, it was organized on the Congregational model. The example thus set was followed in the formation of the succeeding Massachusetts churches. The flood tide of Puritan immigration ran strong till the political situation altered in England in 1640; and it brought to New England such men as John Winthrop in 1630, Rev. John Eliot in 1631, Rev. John Cotton in 1633, and Rev. Richard Mather in 1635, giving to Massachusetts a strong and numerous Congregational population. Slightly divergent views regarding the extent of the franchise, combined with an ardent desire to secure a fertile territory, and more personal motives, led emigrants from Massachusetts, under Rev. Thomas Hooker and John Haynes, to settle in Connecticut in 1634–36; and in 1638 another company, under Rev. John Davenport and Theophilus Eaton, founded New Haven. In 1643 the four Congregational colonies united in a confederacy for mutual protection.

The settlement of New England was followed by a time of planting and developing institutions. The right to vote was restricted in Massachusetts to church members from 1631 to 1664 and in New Haven from 1639 to 1665. No such limitation ever obtained in Plymouth or Connecticut colonies. Schools received the early attention of the settlers, and the founding of Harvard in 1636, followed by the establishment of Yale in 1701, bore witness to the desire for a learned ministry always characteristic of Congregationalism, and were evidences of that interest in education which marks the denomination to the present day. Congregational polity was expounded in treatises by Cotton, Hooker, and Mather, and authoritatively defined by the Cambridge Synod in 1648. Missionary labors among the Indians, begun in 1646 by John Eliot in Newton, Mass., and by Thomas Mayhew on Martha's Vineyard, were considerably successful, resulting, by 1674, in six churches, and bringing about 4000 savages in some measure at least under the influence of the gospel, though these results were robbed of permanance by the dying of the Indian race. The chief intellectual monument of this missionary activity is Eliot's Indian version of the Bible of 1663. The most important internal discussion of seventeenth-century New England Congregationalism was that regarding the "Half-Way Covenant"—the question being whether persons who had themselves been baptized in infancy because of their parents' church membership could in turn bring their own children to baptism when they themselves were subjects of no conscious regenerative change. The decision of a meeting of Massachusetts and Connecticut ministers at Boston in 1657, and of a convention of the Massachusetts churches in 1662, was that such baptized, but not consciously regenerate, parents could bring their children to baptism and transmit the church status they themselves possessed, but

could not come to the Lord's Table or vote in church affairs. Hence the nickname "half-way." Though never universally adopted, the "Half-Way Covenant" was practiced by most New England churches till about the opening decade of the nineteenth century.

Though the majority of the Puritan party in England remained Presbyterian during the seventeenth century and controlled the Westminster Assembly, English Congregationalism had five sturdy champions in that convention; and in the army, as well as among the people as a whole, it grew in favor as the struggle against the King continued. Under the sympathetic rule of Cromwell it reached its widest extension in seventeenth-century England. After the Restoration it suffered the disabilities imposed on Dissenters in general, until partially relieved by the Toleration Act of 1689. Yet, in spite of the labors of such men as Isaac Watts and Philip Doddridge, and the founding of "academies" for ministerial as well as general training, the course of English Congregationalism in the eighteenth century, like the religious life of England as a whole, was one of spiritual decline, until awakened by the new spiritual impulse that came forth from the great Wesleyan revival. Quickened thus, the Congregational churches of England grew in numbers throughout the latter half of the eighteenth century, awakened to fresh zeal for missionary service at home, and a new interest in missions abroad, and became increasingly conscious of their denominational unity and desirous that that unity should find expression.

In America the latter half of the seventeenth and the three opening decades of the eighteenth century saw a steady decline of the spiritual enthusiasm in which the churches of New England had been planted. New England life grew provincial in every respect. From this state of relative decadence the churches of New England were powerfully aroused by a series of "revivals" beginning at Northampton, Mass., under the ministry of Jonathan Edwards in 1734, and extending throughout New England in 1740–42, in connection with a visit of Rev. George Whitefield. The movement, known as the "Great Awakening," stirred the spiritual life of the churches profoundly, but was so accompanied by physical demonstrations and other evidences of excitement as to lead to much division of judgment as to its merits. Partly owing to this division, and partly in consequence of the distraction accompanying the struggle for the political possession of Canada and for American independence, the "Great Awakening" was followed by a period of comparative religious inactivity, lasting till about 1790.

The second half of the eighteenth century, however, witnessed the rise of a native modification of the historic Calvinistic theology—the "New England Theology"—under the leadership of Jonathan Edwards, father and son, of Samuel Hopkins, Joseph Bellamy, and Timothy Dwight. This theology won its way gradually and by 1800 was dominant in Connecticut and Vermont and largely represented in the rest of New England. Parallel to this Edwardean development, though with much smaller following, there ran a "Liberal" movement, represented especially in eastern Massachusetts, and corresponding to similar modifications of doctrine among the Dissenters, especially those of Presbyterian lineage, in England. This "Liberal" theology, already manifest in the preaching of Jonathan Mayhew and Charles Chauncy before the American Revolution, was little discussed during the excitement of that struggle; but when doctrinal debate again attracted attention and was stimulated by a great series of "revivals," beginning about 1790, it was found that a considerable number of Congregational churches had drifted out of sympathy with historic Christianity. Under the lead of men of ability like William Ellery Channing, the "Liberal" movement strengthened, while the cleavage between it and more conservative Congregationalism grew to separation. The year 1815, when "Unitarian" became the popular designation of the new "Liberal" denomination, may be assigned as the approximate date of the schism; though Harvard College had come under the recognized dominance of the "Liberal" party in 1805. The Unitarian division was almost strictly local, but wholly or partially involved about one-tenth of the Congregational churches then existing in the United States. The loss of Harvard College as an agency for ministerial training led the conservative majority of the churches to seek new methods of ministerial education. As a result, theological seminaries were opened at different places and times. See section *Theological Seminaries.*

Congregationalism entered Canada by way of Nova Scotia in 1753. There was a feeble church in Newfoundland as early as 1645, which died and was not revived, and Congregationalism did not reappear there until 1775.

The beginning of the nineteenth century was marked by a rapid broadening and deepening of the activities of American Congregationalism. The rise of home and foreign missions has already been indicated in speaking of the benevolent agencies of Congregationalism. With the settlement of the West, Congregationalism ceased to be confined to New England and the adjacent sections of New York. Its spread was at first slow, because of a distrust engendered by the Unitarian schism, as to its adaptability to meet frontier conditions, and a lack of denominational consciousness which led to ready affiliation with Presbyterianism. But through the efforts of men like Rev. Dr. Leonard Bacon, of New Haven, denominational consciousness was awakened; and, from the fourth decade of the nineteenth century, the planting of distinctly Congregational churches and colleges in the West has gone rapidly forward. This westward extension was greatly aided by the Albany Convention of 1852. After the Civil War Congregationalism entered the South, but has never had a relatively large following in that section of the United States.

Congregationalism during the nineteenth century has witnessed a gradual theological development. The Edwardean school was ably carried on in somewhat divergent directions by Nathaniel W. Taylor at Yale and by Edwards A. Park at Andover. By the middle of the century the influence of Horace Bushnell was becoming felt in a direction away from the Edwardeanism then dominant; and the last three decades have seen increasing welcome given to what is popularly termed "The New Theology." This tendency has met with strenuous opposition; but the division of feeling has at no time been sufficient really to threaten

the denomination with schism. Nineteenth-century American Congregationalism has had its conspicuous preachers in abundance, of whom Lyman Beecher and his son, Henry Ward Beecher, Charles G. Finney, and Richard Salter Storrs may be mentioned as illustrations. It has been ready to adopt new methods of Christian work—its most successful recent contribution being the "Young People's Society of Christian Endeavor," founded by Rev. Francis E. Clark in 1881. Its spirit is warmly missionary, and it desires to coöperate broadly with all who are trying to advance the Redeemer's Kingdom.

English Congregationalism during the last century has been marked by much the same traits; but its existence in the face of an ecclesiastical establishment has led it to emphasize the characteristic principle of independence more proportionately than American Congregationalism. Its struggle has been largely one for equality of privilege in education and exemption from disabilities. Its most important recent educational foundation is Mansfield College, Oxford, of which Rev. Dr. A. M. Fairbairn was principal from its opening in 1886 to 1909. The same tendencies to express denominational unity in organizations for mutual helpfulness have been manifest in England as in America, though in less marked degree. Their illustration in county associations and in larger unions has already been mentioned.

Statistics. The total number of Congregational churches in America in 1645 appears to have been 53. About 120 English Congregational churches were represented in the Savoy Convention of 1658. In 1760 Rev. Dr. Ezra Stiles enumerated the churches of this order in New England, to which region they were then almost exclusively confined, as 530. By 1816 American Congregationalism numbered about 1020 churches and not far from 100,000 communicants. The most recent statistics available (1912, in the *Year Book* of 1913) give the churches of the United States as 6064, ministers as 5944, members as 743,026, and Sunday-school enrollment as 675,677. Their benevolent contributions were $2,363,584, and their home expenditures $9,307,618. The eight Congregational seminaries in the United States had, in 1912–13, 489 theological students. The churches and preaching stations of Great Britain numbered 5036, ministers and local preachers 7752, and church members 491,142. Canada and Newfoundland reported 223 churches and preaching stations, with 12,572 members. Congregationalism in Australia and New Zealand counts 443 churches and preaching stations, with 22,999 members.

CONGREGATIONALISM IN 1912–13 (BASED ON STATISTICS IN THE "YEAR BOOK" OF 1913)

COUNTRIES	Churches Chapels and Stations	Members	Sunday-School Scholars
England and Wales	4,732	452,489	652,751
Scotland	216	35,991	35,148
Ireland	77	2,242	4,767
Channel Islands	11	420	499
Nova Scotia	26	752	651
New Brunswick	8	336	98
Quebec	30	2,802	2,160
Ontario and Northwest	143	8,351	5,289
American Zulu Mission	26	2,406	2,225
British Guiana	55	4,448	4,171
China	4	606	342
India	41	5,215	360
Jamaica	48	3,354	1,635
Japan	103	16,105	7,524
Natal	51	1,419	1,320
Newfoundland	16	331	362
New South Wales	85	5,283	8,007
New Zealand	44	3,799	4,755
Queensland	48	2,290	4,012
Sierra Leone	17	695	574
South Australia	84	5,133	5,044
Syria	1	83	....
Tasmania	47	968	1,654
Victoria	91	4,097	7,223
West Australia	44	1,429	2,427
West and South Africa	384	20,513	9,170
United States	6,064	743,026	675,677
Mission Sunday-schools	....	.....	41,553
American Board (foreign)	2,080	83,152	78,651
London Missionary Society	1,730	84,071	90,451
Totals	16,306	1,491,806	1,648,720

The foreign missionary activities of the United States and Canada in 1912–13 were represented by 615 missionaries, assisted by 4993 native laborers, carrying on missions in 113 foreign stations, with 629 churches organized, and an enrollment of 83,152 communicants, of whom 3625 had been added during the previous year. Statistics for the London Missionary Society, through which the outreaching work of the English Congregational churches is maintained, show that during 1912–13 it employed 474 missionaries, assisted by 7262 native laborers, in 97 stations, and ministering to 84,071 communicants, of whom 2144 were received during the year then closing.

Bibliography. The student who wishes to investigate the history of Congregationalism thoroughly will look for guidance to the bibliography of 7250 titles of publications relating to Congregationalism issued between 1546 and 1879, which was given by Rev. Dr. H. M. Dexter as an appendix to his *Congregationalism of the Last Three Hundred Years* (New York, 1880). So closely is Congregationalism interwoven with the origins of New England that any good history of New England gives much regarding its spread and workings. General sketches of American Congregationalism are those of Rev. Dr. A. E. Dunning, *Congregationalists in America* (New York, 1894); and Prof. Williston Walker, *A History of the Congregational Churches in the United States* (ib., 1894). The characteristics of Congregational religious life are treated by Rev. Dr. George Leon Walker, *Some Aspects of the Religious Life of New England* (Boston, 1897). The reader specially interested in the beginnings of Congregationalism will be aided by the work of Rev. Dr. Dexter, above cited; also, John A. Goodwin, *The Pilgrim Republic* (ib., 1888); Rev. Dr. John Brown, *The Pilgrim Fathers of New England* (London and New York, 1895); Prof. Edward Arber, *The Story of the Pilgrim Fathers* (London, 1897); Rev. Dr. Fred. J. Powicke, *Henry Barrow, Separatist* (ib., 1900). Henry M. and Morton Dexter, *The England and Holland of the Pilgrims* (Boston, 1905); Champlin Burrage, *The True Story of Robert Browne* (Oxford, 1906); and his *The Early English Dissenters* (Cambridge, 1912). The doctrinal peculiarities of American Congregationalism have been compactly sketched by Prof. George N. Boardman, *A History of New England Theology* (New York, 1899), and by Prof. Frank Hugh Foster, *A Genetic History of the New England Theology* (Chicago, 1907).

The best history of English Congregationalism is that of R. W. and A. W. W. Dale, *History of*

English Congregationalism (London, 1907). The five volumes of Rev. Dr. John Waddington, *Congregational History* (London, 1869–78; new ed., 1880), treat the story at much length to the date last mentioned. Contemporary English Congregationalism is well discussed by Rev. Dr. A. H. Bradford, *The Pilgrim in Old England* (New York, 1893). The story of Scotch Congregationalism is well and briefly told by Rev. James Ross, *A History of Congregational Independency in Scotland* (Glasgow, 1900).

The main documents relating to the polity and beliefs of Congregationalism are collected by Prof. Williston Walker, *The Creeds and Platforms of Congregationalism* (New York, 1893). Brief manuals of its usages are those of a committee of the National Council, entitled *The Council Manual for a Congregational Church* (Boston, 1896); of Rev. George M. Boynton, *The Congregational Way* (ib., 1902); and of the Rev. Asher Anderson, *Congregational Faith and Practice* (ib., 1906). For matters relating to national councils, consult the works of Rev. E. Lyman Hood, *The National Council of the Congregational Churches of the United States* (Boston, 1901), and of Rev. Asher Anderson, *National Council Digest* (ib., 1906). English and American Congregational statistics are given in their respective *Year Books*.

CONGREGATIONAL METHODIST CHURCH, The. A body formed in May, 1852, in Monroe Co., Ga., by ministers and laymen who had withdrawn from the Methodist Episcopal church and wished to establish a church with Methodistic doctrines, but giving the people a voice in their own government. In 1852 the first district conference was held and a Book of Discipline adopted; in 1855 the first general convention was held. Since 1881 many churches have joined the Congregational body, and in 1913 the Congregational Methodists reported 333 churches and 15,529 members. In government it is not strictly Congregational, since it has semiannual district conferences, annual State conferences, and quadrennial general conferences, and it is admissible to carry an appeal from one to another. It admits both white and colored persons, the latter being separately organized. A publishing house is maintained at Ellisville, Miss. The official organ is *The Messenger*. The only educational institution under the auspices of the denomination is the Atlanta Bible School. Consult *Religious Census of the United States* (1910).

CONGREGATION OF CLUNY. See CLUNIACS.

CONGREGATION OF THE HOLY CROSS. See HOLY CROSS, CONGREGATION OF THE.

CONGREGATION OF THE MISSION. See LAZARISTS.

CON'GRESS (Lat. *congressus*, conference, from *congredi*, to meet together, from *com-*, together + *gradi*, to step). In international affairs, an assembly either of sovereign princes or of delegates of sovereign states for the purpose of considering matters of common interest. In the United States, where the term has now a specific meaning as applied to the National Legislature (see UNITED STATES), it had a similar origin, the first Congress being that of the delegates from the various British Colonies, who met on Oct. 7, 1765, for the purpose of considering their grievances. Previous to signing a treaty of peace, a meeting of plenipotentiaries usually takes place, to which the name of a congress is sometimes applied, though the term seems more properly to be reserved for those more important meetings at which extensive schemes of future policy are determined. The period of secular diplomatic congresses opened with the Congress of Münster and Osnabrück, which closed the Thirty Years' War by the Peace of Westphalia in 1648 (q.v.). Since then, omitting those diplomatic bodies whose object was simply to arrange terms of peace at the close of a war, the most important European congresses have been those of Vienna (1814–15), Paris (1856), Berlin (1878), and the International Peace Conference at The Hague (1899). An international "Pan-American" congress, to discuss industrial and commercial questions, was held at Washington, from October, 1888, to April, 1890. In the winter of 1901–02 a similar congress assembled at Mexico and discussed at great length the question of international arbitration. The international conference at Algeciras that defined the attitude of the Great Powers towards Morocco was held in 1905. See BERLIN, CONGRESS OF; PARIS, TREATIES OF; VIENNA, CONGRESS OF.

CONGRESS, UNITED STATES. The legislative branch of the Federal government of the United States. It was instituted by the Constitution, which prescribes its membership and defines its powers. It has no general legislative power, such as is enjoyed by the British Parliament and, in a lesser degree, by the legislatures of the several American States; but it has only such functions and authority as the Constitution, expressly or by necessary implication, has conferred upon it. Acting in conjunction with the President and the Federal judiciary, it exercises the sovereign power of the people of the United States in so far as that power has been committed to the central government.

Congress is composed of two "houses," or chambers—a Senate and a House of Representatives. It is not, however, as is generally assumed to be the case, modeled upon the British Parliament, with its House of Lords and House of Commons, nor is its bicameral form due to any general agreement on the part of the framers of the Constitution that that type of legislature was theoretically preferable to a legislature of a simpler type. The Continental Congress, under whose direction the War of the Rebellion was waged, had after the adoption of the Articles of Confederation, as before, only a single chamber. But this was not of a popular character, and it is not the House of Representatives, but the Senate, which represents it in the present Congress. These first American congresses represented not the people of the Colonies and States, but the Colonies and States themselves, and it was to preserve the weight and dignity of the States among themselves, and especially of the smaller and less populous States as against the larger and more influential ones, that the Senate was instituted as a counterweight to the popular branch of the National Legislature.

The Senate is composed of two Senators from each State, and its membership has accordingly varied from 22 in the first Congress (when 11 States constituted the Union) to 96 at the present time (1914). The Constitution, as amended in 1913, prescribes that Senators shall be chosen by the people of the several States for a term of six years, and constitutes them a permanent and continuing body by pro-

viding a method of classification, whereunder the term of one class shall continuously overlap that of another, the terms of one-third of the members expiring every two years. Senators must be 30 years of age and residents of the State for which they shall be chosen. The presiding officer of the Senate is the Vice President of the United States, but he has no part in its deliberations and no vote unless the Senators are equally divided. The rule of the Congress of the Confederation which preceded the Constitution, that the voting should be by States, each State represented having one vote, was not retained in the creation of the Senate, it being provided by the Constitution that each Senator shall have an individual vote. Senators receive a compensation fixed by Congress, of $7500 a year, with a small allowance for stationery and mileage.

The House of Representatives is not a permanent or continuing body, but its entire membership is renewed simultaneously every second year. Its members are chosen by popular vote, and it is provided that they shall be apportioned among the several States included in the Union according to their respective numbers. The Constitution, as adopted, provided that for the purpose of apportionment the population of a State should be determined by adding to the whole number of free persons three-fifths of the whole number of slaves. The basis of apportionment fixed by the Constitution for the first enumeration was one Representative for every 30,000 inhabitants, with the proviso that each State should have at least one Representative. The first House numbered 65, and successive enumerations and apportionments have varied the number of Representatives as follows: in 1793, 105; 1803, 141; 1813, 181; 1823, 213; 1833, 240; 1843, 223; 1853, 233; 1863 (during the Civil War), 243; 1873, 293; 1883, 325; 1891, 357; 1901, 386; 1910, 435. The basis of apportionment under the thirteenth census (1910) is one Representative to every 212,407 inhabitants. This furnishes the following representation for the several States:

Alabama	10	Nebraska	6
Arizona	1	Nevada	1
Arkansas	7	New Hampshire	2
California	11	New Jersey	12
Colorado	4	New Mexico	1
Connecticut	5	New York	43
Delaware	1	North Carolina	10
Florida	4	North Dakota	3
Georgia	12	Ohio	22
Idaho	2	Oklahoma	8
Illinois	27	Oregon	3
Indiana	13	Pennsylvania	36
Iowa	11	Rhode Island	3
Kansas	8	South Carolina	7
Kentucky	11	South Dakota	3
Louisiana	8	Tennessee	10
Maine	4	Texas	18
Maryland	6	Utah	2
Massachusetts	16	Vermont	2
Michigan	13	Virginia	10
Minnesota	10	Washington	5
Mississippi	8	West Virginia	6
Missouri	16	Wisconsin	11
Montana	2	Wyoming	1

It is further provided by the Constitution that Representatives shall be at least 25 years of age and residents of the States in which they are chosen. They receive an annual salary, determined by Congress, the amount of which at present is $7500. The House of Representatives chooses its own presiding officer, called the Speaker, from among its members. He receives a salary of $12,000. In the process of time this has become an office of great power and importance, ranking, perhaps, next after that of the President in influence and authority. This aggrandizement of the Speaker of the House of Representatives has resulted from the control over legislation, which, as the leader of the dominant political party in the House and under the committee system which has come to prevail in Congress, he has gradually acquired. He does not, upon becoming Speaker, lose his right to vote or otherwise to participate in the proceedings of the House.

Under the Constitution the two houses of Congress have in most respects an equal voice in legislation, the only important exception being the requirement that all revenue bills shall originate in the popular branch of the Legislature. Each house is made the sole judge of the elections, returns, and qualifications of its own members, though the times, places, and manner of holding elections for Senators and Representatives are left to the legislatures of the several States, until provided for by law of Congress.

The ample legislative powers of Congress, which are enumerated in Sec. 8 of Art. I and Sec. 3 of Art. IV of the Constitution (q.v.), are limited by the veto power of the President. Every bill intended to have the force of law must be submitted to him, after passing the two houses separately, and, if vetoed by him, will fail to take effect, unless passed a second time and by a two-thirds vote of each house. If any bill shall not be returned by the President within 10 days after it shall have been presented to him, it shall become a law in like manner as if he had signed it, unless its return be prevented by the adjournment of Congress. The Constitution provides for an annual meeting of Congress on the first Monday in December unless a different date is duly appointed by law. The President is empowered by the Constitution to call an extra session of Congress or of either house.

In addition to their legislative powers, each of the two houses of Congress is endowed by the Constitution with important functions in the government. The House of Representatives has the sole power of impeachment, and the Senate the exclusive authority to try impeachments. In addition to this, the Senate exercises, in conjunction with the President, important executive powers in the ratification of treaties and in the confirmation of his appointments to all important offices of the government, including the members of his cabinet, the judges of the Supreme and other Federal courts, and even officers of the army and navy.

The large increase in the number of Representatives and the growth in volume and complexity of the matters with which they have to deal have necessitated the reference of all bills to standing committees. These conditions have made it impossible for the House to give deliberate consideration to any but the most important measures of legislation, and it follows that the real process of legislation—the discussion, the sifting, the shaping of bills—is done mainly in the committee rooms. The committees, therefore, being deliberately made up with reference to the carrying out of party policy, have acquired virtual control over the legislation of the House, their action on bills submitted to them being usually final and conclusive.

The "committee system," as it is called, was

adopted by the House of Representatives at an early period of its history. The members of the 57 standing committees are chosen by the majority and minority parties in caucus, subject to the approval of the House. These committees vary in size and are made up of members of all parties, the dominant party having an effective majority in each. The principal committees of the House are those on Rules, Appropriations, Ways and Means, Foreign Affairs, Judiciary, Commerce, Elections, Military Affairs, and Naval Affairs. The Senate, because of its smaller membership and its tradition of dignity and deliberation, has to a larger extent than the House retained the character of a deliberate assembly, and a much larger part of the work of legislation is still actually performed by it. It has also adopted the committee system; but its committees perform the more legitimate function of sifting and shaping the bills for their more convenient consideration by the Senate. They are appointed by vote of the Senate and, like those of the House, hold office during the life of the Congress for which they are chosen. The most important of the Senate committees is that on Foreign Affairs, though those on Appropriations, Ways and Means, the Judiciary, and on Military and Naval Affairs, also play an important rôle in shaping legislation. For a history of the United States Congress, see UNITED STATES.

The leading authorities on the position of Congress in the American scheme of government are: Woodrow Wilson, *Congressional Government* (Boston, 1885), and Bryce, *The American Commonwealth* (London, 1893). See also the authorities referred to in CONSTITUTION OF THE UNITED STATES.

CONGRES'SIONAL CEMETERY. A handsome cemetery near Washington containing monuments to such members of Congress as have died during their terms of office. See WASHINGTON.

CONGRESSIONAL LIBRARY. See LIBRARY OF CONGRESS.

CONGRESSIONAL RECORD. The journal of the United States Congress. Up to 1799 the Senate sat with closed doors, and no reports of its proceedings were published. Since that time an official record of the proceedings of each house is required to be published. The so-called "executive sessions" of the Senate are secret. The journal now known as the *Congressional Record* was called from 1789 to 1824 the *Annals of Congress;* from 1825 to 1837 the *Register of Debates;* from 1834 to 1874 the *Congressional Globe.* Since 1875 its present name has been used. The *Record,* however, is not an accurate transcript of the actual proceedings. Members are allowed to revise their remarks before they appear in type; and they also frequently receive from the House "leave to print" speeches which they have never delivered, but which appear in the *Record* as though a part of the proceedings of the session.

CONGRESSMAN AT LARGE. A member of the United States House of Representatives elected by the voters of the entire State, and not, as is customary, by those of congressional districts. Such Congressmen are elected under the apportionment acts of Congress, and the election of a Congressman at large is merely a device adopted to give each State the proper number of representatives under the acts until the State should be redistricted. Some States have had two such members, and several one. According to a congressional Act of 1911, the ratio of congressional representation is one Representative for every 212,407 of the population.

CONGREVE, kŏn'grēv, RICHARD (1818–99). An English philosophical writer and essayist, born at Leamington. He studied under Arnold at Rugby and afterward at Wadham College, Oxford, of which he became successively scholar, fellow, and tutor, but resigned after having become definitely a disciple of Comte. In 1855 he published a good edition of Aristotle's *Politics* (1855). Among his other publications are: *The Roman Empire of the West* (1855); *The Catechism of Positive Religion,* trans. from Comte (1858; 3d ed., 1891); *Elizabeth of England* (1862); *The Irish Crisis* (1881); *Historical Lectures* (1902). He was early one of the foremost exponents of English Positivism.

CONGREVE, WILLIAM (1670–1729). A brilliant English dramatist. He was born at Bardsley, Yorkshire, and educated at Kilkenny, and at Trinity College, Dublin. He returned to England and was entered at the Middle Temple, but did not take kindly to law. His first publication was a novel, entitled *Incognita,* really a dramatic intrigue put into narrative. His first play, *The Old Bachelor,* was produced at Drury Lane in January, 1693, and its success was remarkable. In November he brought out *The Double-Dealer,* which was a comparative failure; but his comedy, *Love for Love,* performed in 1695, was a great success and brought to its author money and fame. *The Mourning Bride,* a blank-verse tragedy, was acted in 1697. Its success exceeded even that of his comedies, but it has long since been forgotten. Three years after, he produced a comedy, entitled *The Way of the World,* which failed completely and disgusted him with the theatre. In other respects Congreve was a fortunate man. He held various offices, which together yielded him an income of £1200. Congreve affected to despise his theatrical triumphs and cultivated the manners of the fine gentleman—an eccentricity which laid him open to rebuke when he was visited by Voltaire. In his later days he was afflicted with gout and blindness. He died in London, 1729, and was buried in Westminster Abbey. As a comic dramatist, Congreve has been variously estimated. He was gross, but his age was gross. His plots are intricate, but they were so intended. His world is composed of wives, gallants, and husbands—and the husbands are hoodwinked. The characters have no heart, no generosity, but they play their parts brilliantly. Indeed, the wit of Congreve's dialogue is unsurpassed in our later drama. Famous essays on Congreve and the art he represents are: Hazlitt, *Lectures on English Poets and English Comic Writers* (London, 1846); Lamb, "On the Artificial Comedy of the Last Century," in *Essays of Elia* (ib., 1875); Leigh Hunt, critical notice, prefixed to *The Dramatic Works of Wycherley, Congreve,* etc. (1849), which he edited; Macaulay, review of Hunt, entitled *Comic Dramatists of Leigh Hunt* (London, 1848). Consult: Congreve's *Comedies,* ed. Ewald (London, 1887); id., ed. Street (ib., 1895); Gosse, *Life of Congreve* (ib., 1888), which contains a bibliography by J. P. Anderson, and "William Congreve" (New York, 1913), selected plays edited by William Archer in *Masterpieces of the English Drama Series.*

CONGREVE, Sir William (1772–1828). An English engineer, the inventor of the Congreve rocket (1805). (See Artillery.) He was educated at Trinity College, Cambridge, received a commission in the artillery, and became controller of the Royal Laboratory at Woolwich. He became a member of Parliament for Gatton in 1812 and later for Plymouth in 1820. His invention brought him many honors and the friendship of George IV.

As a result of Congreve's invention, rockets with a head forming a projectile became part of the equipment of the British army, and, though later supplanted by the Hale rocket, the Congreve rocket was used as late as 1860. There were four general types—a three-pounder, six-pounder, 12-pounder, and 24-pounder. The rocket was formed by a case of sheet iron to which was secured a cylindrical conical head forming the projectile, and the latter, being hollow, could be filled with a bursting charge, if desired, with a fuse ignited by the main charge of the rocket. At the lower end of the iron case which carried the rocket charge there was a base provided with vents and a socket for a stick. The rocket was fired from rocket tubes mounted on a tripod. These rockets were large and heavy, and, while they did little direct damage, by their brilliancy and noise in flight when first introduced they exercised an important moral effect. The Congreve rocket was invented about 1805 and was used as early as 1807. On several occasions these rockets were fired against the French fleet, and at the battle of Leipzig they served to frighten the French and throw a portion of them into confusion, but otherwise did no damage.

Sir William Congreve is also famous for a celebrated and ingenious attempt to realize perpetual motion, based on the capillary action of water and absorbent material such as a sponge, which was mounted on an endless band passing over an inclined plane. This was surrounded by a band of links of lead which served to squeeze out the water from one side after it was absorbed on the other. His publications include: *The Congreve Rocket System* (1807; Ger. trans., 1829); *Mounting of Naval Ordnance* (1812); *Description of the Hydropneumatical Lock* (1815); *A New Principle of Steam Engine* (1819).

CON'GRUENCE (Lat. *congruentia*, from *congruere*, to agree). In geometry, plane figures which can be superposed so as to coincide throughout are said to be congruent. This is the Euclidean definition of equality and indicates both equality of area and similarity of form. The symbol $\cong$ for congruence signifies these two properties, being composed of the old letter *s* for (*similis*) and the sign of equality. The symbol is more common in Germany than elsewhere. In general it is not necessary actually to superpose the figures. If the equality of certain parts is known, the equality of the other parts can be established; e.g., if two sides and the included angle of one triangle are equal to the corresponding parts of another, the triangles are congruent, since the remaining parts are also equal and similarly placed. Congruence is related to axial and central symmetry (q.v.) and constitutes an important theory of geometry. Congruency, in modern geometry, relates to a system of elements satisfying a twofold condition. Of all possible lines, those particular lines which satisfy a given condition are together called a complex, and those which satisfy two conditions are called a congruency; e.g., all lines which intersect a given circle form a complex, and all which intersect two given circles form a congruency. The order of a congruency is the number of its rays coplanar with a given plane; the class of a congruency is the number of its lines concurrent in a given point.

In the theory of numbers two integers are said to be congruent with respect to a third, called the "modulus," when their difference is exactly divisible by the modulus. Thus, 12 and 7, 27 and 12, are congruent with respect to 5 as a modulus, since (12—7) and (27—12) are divisible by 5. This relation is expressed thus: $12 \equiv 7 \pmod 5$, $27 \equiv 12 \pmod 5$, and, in general, $a \equiv b \pmod c$. When two integers are congruent with respect to a third, either is called the residual of the other with respect to this modulus. A few fundamental theorems of congruences are: (1) If $a_1 \equiv a'_1$, $a_2 \equiv a'_2$, . . . $a_n \equiv a'_n$ (to the same modulus), then $a_1 + a_2 + \ldots a_n \equiv a'_1 + a'_2 + \ldots a'_n$. (2) If $a \equiv a'$, then $na \equiv na'$. (3) If $a \equiv a'$, $b \equiv b'$, then $ab \equiv a'b'$. (4) If $a \equiv a'$, then $a^n \equiv a'^n$. (5) If $a_1 \equiv a'_1$, $a_2 \equiv a'_2$, . . . , then G $(a_1, a_2, \ldots) \equiv$ G $(a'_1, a'_2, \ldots)$, G designating any rational integral function of $a_1, a_2, \ldots$.

In algebra the congruence of functions is considered in addition to the congruence of numbers. When the elements considered are of the form $ax + b$, the congruence is called linear. When the elements are of the form $ax^2 + bx + c$, the congruence is called quadratic, and so on. To solve a congruence is to find the values of the unknown quantity which satisfy the congruence. Thus, to solve the quadratic congruence $x^2 \equiv 39 \pmod{49}$ is to find the number whose square gives a remainder 39 when divided by 49. These numbers are 23, 26.

As to geometry, consult: Henrici, *Geometry of Congruent Figures* (London, 1888); Plücker, *Neue Geometrie des Raumes gegründet auf die Betrachtung der geraden Linie als Raumelement*, ed. by Clebsch (Leipzig, 1868); and as to algebra, Salmon, *Modern Higher Algebra* (Dublin, 1876); Pund, *Algebra mit Einschluss der elementaren Zahlentheorie* (Leipzig, 1899); Pascal, *Repertorium der höheren Mathematik* (Ger. ed., ib., 1902), with bibliography; Weber and Wellstern, *Encyklopädie der elementaren Algebra und Analysis* (ib., 1903) and *Encyklopädie der elementaren Geometrie* (2d ed., ib., 1907), also with bibliography.

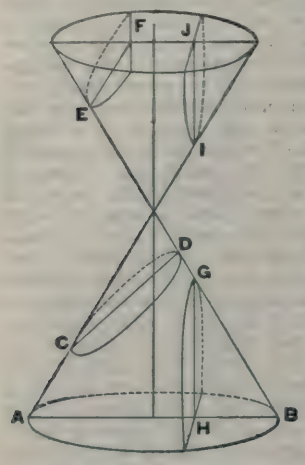
CONI, kō'nē. See Cuneo.

CONIBO, kō-nē'bō. An important tribe of Panoan stock (q.v.), ranging along the middle Ucayali River, northeastern Peru. For a long time they repelled the missionaries, but are now completely Christianized. In their daily life, however, they cling to their old customs, although they learn Spanish readily and are good house servants. They live chiefly by boating, fishing, and gathering sarsaparilla. They paint their faces in red and blue and wear silver rings in their lips and noses. Consult Galt, in *Report of the Smithsonian Institution* for 1877.

CONICEIN. See Coniine.

CON'IC SECTIONS. Curves which may be formed by various sections of a cone (q.v.). In the figure, which represents the two nappes of a right circular cone, *AB*, a section perpendicular to the axis, is a circle; *CD*, a section oblique to

the axis, cutting all the elements of the conical surface on one side of the vertex, is an ellipse; *EF*, a section parallel to the element *CI*, is a parabola; and *GH*, *IJ*, a section cutting both nappes, gives the two branches of an hyperbola. These curves were discovered by Menæchmus in the fourth century B.C. and were known for a long time as Menæchmian triads. The Greeks extensively cultivated the theory of the conic sections. Archimedes contributed to the knowledge of the subject by determining the area of the parabola and by other discoveries. The great work of Apollonius (q.v.) was the classic Greek treatise on the subject. He studied conic sections by the aid of pure geometry, in somewhat the same manner that Euclid (q.v.) treated the elements of the science. Since the invention of coördinate geometry (see ANALYTIC GEOMETRY), new interest has attached to these curves, and the properties of conics form the basis of instruction in analytic geometry. Indeed, the subject is not often treated by pure geometry at present, the analytic method being much simpler. See CIRCLE; ELLIPSE; PARABOLA; HYPERBOLA; CURVE; MATHEMATICS.



CONIDIA (Neo-Lat. nom. pl., from Gk. *κόνις, konis*, dust). Aërial spores of fungi, formed in chains or clusters upon a special branch of the mycelium (*conidiophore*). They are formed by the rounding off of a cell or a succession of cells at the tip of a branch, as distinct from the formation of spores within a spore case (*sporangium*). Conidia behave sometimes as spores (producing new plants directly) and sometimes as sporangia (producing and discharging spores). See FUNGI.

CONIDIOPHORE (Neo-Lat. *conidium* + Gk. *-φόρος, -phoros*, from *φέρειν, pherein*, to bear). The special branch of the body of a fungus (*mycelium*) which bears conidia (q.v.). See FUNGI.

CONIFERÆ (Lat. nom. pl. of *conifer*, cone bearing, from *conus*, cone, Gk. *κῶνος, kōnos* + *ferre*, to bear). The greatest of the four living groups of gymnosperms. The species are all trees or shrubs and are characteristic of the temperate regions, being almost entirely absent from the tropics except at high altitudes. Prominent representatives of the group are the pines, spruces, hemlocks, firs, larches, cedars, cypresses, redwoods, junipers, arbor vitæ, and yews. The habit of the trees is characteristic, a central shaft extending continuously to the very top, while the lateral branches spread horizontally, usually reduced in length towards the top of the tree, resulting in a conical outline. Another peculiar feature is the "needle leaf," which seems to be poorly adapted for foliage. It is very slender and firm, being well organized to endure cold. In some of the conifers, however, as in species of *Podocarpus*, the leaves are quite broad and flat; while in others, as in the arbor vitæ, they consist of closely appressed and overlapping disklike bodies. As the leaves have no regular period of falling, the trees are always clothed with them and are commonly called evergreens. There are a few exceptions to this evergreen habit, however, as in the case of the common larch or tamarack, which sheds its leaves every season. The branches of conifers are apt to occur in two forms, as may be seen in the pines. There are the elongated axes, which bear only scales, known as the long shoots; and also short, spurlike, dwarf branches, which bear the clusters of needle leaves. This disposition of the foliage leaves is by no means common to all conifers or even to all ages of the pines. In many conifers, as in spruces and in seedling pines, the needles occur on the long shoots. The structure which gives name to the group is the conelike strobilus which bears the seeds and which sometimes becomes very large. This, when mature, consists of heavy overlapping scales, at the base of which, upon the upper side, the seeds are found. The strobili which are made up of the stamens are never so prominent or permanent and hence are not usually noticed. The pollination of conifers is effected by the wind, and hence the pollen is very light and powdery and is produced in enormous quantities. In the pines the pollen grains are assisted in this wind transportation by the development of a pair of wings, which are outgrowths from the outer coat of the spore. Sometimes strong winds carry the pollen far from the forests which produce it, and the fall of this yellow powder in places in which the phenomenon is rare gives rise to accounts of "showers of sulphur."

Structure. The tissues of the stems of conifers are very characteristic. The woody bundles are arranged to form a hollow cylinder, as in the dicotyledons, and hence are able to increase in diameter during each growing season. It is only the primitive bundles, however, which are made up of true vessels. All of the secondary bundles, which form the whole mass of wood, consist of tracheids, i.e., thick-walled cells resembling true vessels, but not fitted together end to end so as to form more or less continuous vessels. These tracheids are also distinguished, as in all gymnosperms, by bearing upon their walls bordered pits, i.e., thin spots which appear to be bounded by two concentric circles. They are also packed together very closely and with remarkable regularity, so that the wood is very uniform and fine-grained, and hence easily split.

Classification. There are two great families of conifers, the Pinaceæ and the Taxaceæ. The former has true cones, by whose scales the ovules are concealed, and whose seeds ripen dry. In general, the cones ripen dry and hard, but sometimes, as in junipers, they become pulpy, the whole cone forming the so-called "berry." This family (Pinaceæ) is much the larger one and contains four well-marked tribes. Chief among these are the Abietineæ, containing the pines, spruces, hemlocks, firs, larches, etc., the genus *Pinus* with its 70 species being by far the largest genus of conifers. The Cupressineæ contain the various cypresses and cedars; the Taxodineæ contain the bald cypresses, redwoods, and their allies; while the Araucarineæ include the Araucarian or Norfolk pines

of the Southern Hemisphere. The other family, the Taxaceæ, has exposed ovules, and the seed either ripens fleshy or has a fleshy investment. It includes two tribes—the Podocarpineæ, genera of the Southern Hemisphere (the genus *Podocarpus*, with 40 species, being the second largest of the conifers), and the Taxineæ, including the yews (*Taxus*) and their allies.

Some of the conifers, as the pines and junipers, are very widely distributed, while others, like the gigantic redwoods (*Sequoia*) of California and the bald cypress (*Taxodium*) are now very much restricted. The greatest displays of much restricted ("endemic") genera occur in the China-Japan region and in the Australasian region.

Fossil Forms. Conifers are certainly very ancient, for undoubted fossil remains occur from the Permian on, and the total amount of fossil material is enormous. This material was named first upon the basis of external appearance, and the literature of paleobotany is full of names suggestive of affinities with living genera. It has been found that superficial resemblances are misleading, and that even leaf-bearing twigs and cones cannot be relied upon to determine affinities. For example, a number of Cretaceous conifers were referred with confidence to the genus *Sequoia* which have now been discovered to be Araucarians. In recent years the development of our knowledge of vascular anatomy has given a means of determining conifers such as was never possessed before. As a consequence, the enormous amount of Mesozoic material is beginning to be understood. In outlining the fossil history of Conifers, it is necessary to consider the six tribes separately, for they are the real units of conifer classification.

In 1901 competent opinion decided that there was no sure evidence of the Abietineæ (pines and their allies) below the Cretaceous. Later investigations not only discovered pines in the Jurassic, but also discovered that they were already differentiated into their two main series. More recently undoubted pines were discovered in the Triassic of Sweden, so that at present the Abietineæ can be traced to the lowest Mesozoic in a position to be connected with the Paleozoic gymnosperms. Modifications in character can be traced from the living pines through the Cretaceous pines and the still more ancient *Prepinus* to the Paleozoic Cordaitales. It is evident, therefore, that the Abietineæ are as old as any tribe of conifers can be, and that *Pinus* is its oldest genus.

The Araucarineæ (Araucarians) are rival claimants with the Abietineæ for antiquity, and the question as to the relationship of these two tribes is under discussion. It is now known that there existed an extensive Araucarian flora during the Mesozoic, and that this was in all probability the dominant type of conifers at that time. The Araucarians ranged from Greenland to Patagonia in one hemisphere, and from Spitzbergen to Cape Colony in the other, but apparently became almost extinct at the opening of the Tertiary, and are now restricted to South America and the Australasian region, having disappeared from North America, Europe, Africa, and practically all of Asia. In our own country the Atlantic coastal plain evidently supported during the Mesozoic an abundant Araucarian vegetation, and many of the forms that had been referred to other tribes upon superficial evidence have proved to be Araucarians. An abundant and world-wide Araucarian flora during the Jurassic period would suggest the existence of the tribe in much earlier times, and the evidence is accumulating that the Araucarians existed during the earliest Mesozoic, relating them also in time with the Paleozoic Cordaitales. The general impression that the Araucarians are the oldest of conifers seems to have arisen from the abundance of the peculiar Araucarian type of wood in the Paleozoic. This has since been discovered to belong to the Paleozoic group Cordaitales, so that there is no evidence at present that the Araucarians existed during the Paleozoic. There are three alternatives under consideration as to the relationship that exists between Araucarineæ and Abietineæ: either (1) the Araucarineæ were derived from the Abietineæ near the beginning of the Mesozoic; or (2) the Abietineæ were derived from the Araucarineæ at the same early period; or (3) the two tribes originated independently from the Cordaitales.

There is no doubt that the remaining four tribes are much younger than the two just considered. The Taxodineæ (bald cypress, *Sequoia*, etc.) are not known to have existed before the end of the Cretaceous. Claims have been made for the occurrence of *Sequoia* in the Lower Cretaceous and even in the Jurassic, but much doubt has been thrown upon these determinations by the fact that a number of Mesozoic sequoias have proved to be Araucarians. In this state of uncertainty the only safe conclusion is that the Taxodineæ are not older than the Cretaceous, and that the most certain remains are those of the Tertiary. The same statement may be made for the Cupressineæ (cypress, junipers, etc.), for although cypress-like twigs and cones have been described from the Jurassic, there is no reliable evidence of the tribe earlier than the Upper Cretaceous. There is general agreement that these two tribes were derived from the Abietineæ during the course of the Mesozoic.

The two remaining tribes are the Taxineæ (yews, etc.) and the Podocarpineæ (podocarps). Neither of these tribes has been recognized farther back than the Cretaceous, and, so far as this negative evidence can be relied upon, they are comparatively modern tribes among the gymnosperms, certainly much younger than the Abietineæ and Araucarineæ. It is entirely possible that older representatives of these tribes existed, and that they have not been recognized among coniferous remains. The present geographic distribution of the two tribes is sharply contrasted, the podocarps belonging almost exclusively to the Southern Hemisphere and the taxads as exclusively to the Northern. This associates the podocarps with the Araucarians, and the taxads with the other tribes of conifers. It is altogether probable that this association also indicates the phylogenetic connections.

Bibliography. Solms-Laubach, *Fossil Botany* (Oxford, 1891); Scott, *Studies in Fossil Botany* (London, 1909); Coulter and Chamberlain, *Morphology of Gymnosperms* (Chicago, 1910).

CONIINE, kō′nī-īn (from Lat. *conium*, Gk. *κώνειον*, *kōneion*, hemlock), $C_8H_{17}N$. The active alkaloid principle of hemlock, the seeds of the spotted hemlock plant (*Conium maculatum*, Linné). Being a volatile substance, coniine may be readily obtained from the seeds by distilling with water which contains a little soda in solution; coniine then passes over with the water in the form of a yellowish oil, but, when purified by

redistillation, it is obtained as a colorless, transparent, oily liquid having a penetrating hemlock-like odor, communicating a burning sensation if applied to the tongue and acting as a very energetic poison. It has a powerful alkaline reaction and precipitates metallic oxides from many salts. Strong sulphuric acid causes its compounds to assume first a purple-red and then an olive-green color, while nitric acid gives a blood-red color that fades into an orange. It is moderately soluble in water, its solutions having the property of turning the plane of polarized light to the right. It is sparingly soluble in carbon disulphide, but mixes in all proportions with alcohol. If pure, it boils at 167° C. The coniine sold commercially contains small amounts of j-conicein, an alkaloid closely allied to coniine and having the formula $C_8H_{15}N$. Coniine may be freed from conicein with the aid of ordinary dextrotartaric acid.

The chief physiological effect of coniine is a powerful depression of all motor nerves, beginning at their periphery and gradually ascending to the spinal cord. As a result, all motion, voluntary and reflex, is paralyzed, although the muscles are not affected. This leads to enfeeblement of the respiration and finally causes death by asphyxia. The symptoms of coniine poisoning are increasing heaviness in the legs and feebleness in the arms, dimness of vision, dilated pupils, difficulty in swallowing and breathing, and, finally, loss of the voice. As coniine has no action on the brain, consciousness is preserved until the end. The following illustration will give an idea of the rapidity of its action: One drop placed in the eye of a rabbit killed it in nine minutes; three drops employed in the same way killed a cat in a minute and a half; while five drops poured into the throat of a small dog began to act in 30 seconds, and in as many more motion and respiration had ceased. In a case of coniine poisoning emetics and the stomach pump should be employed as early as possible; the patient's feet should be kept warm, a stimulant injected subcutaneously, and artificial respiration employed. Coniine is but rarely used as a therapeutic agent in medicine; it is extremely doubtful whether it has any useful effect at all, except perhaps in spasmodic diseases, like whooping cough, lockjaw, or epilepsy. Chemically coniine has been shown to be the dextrorotary modification of a-propylpiperidine. The artificial preparation of coniine was the first synthesis of an optically active alkaloid. See ALKALOIDS; HEMLOCK.

CO'NINCK. See KONINCK.

CON'INGSBY, or THE NEW GENERATION. A novel by Benjamin Disraeli (1844).

CO'NINGTON, JOHN (1825–69). An English classical scholar, born at Boston, Lincolnshire. He studied at Rugby, under Dr. Arnold, in 1838–43, and at Magdalen College, Oxford, in 1843–46, and in 1846 became a scholar of University College. In 1849 he read law with much unwillingness for six months, at the London Inns of Court, and thereupon returned to the university. He contributed articles to the *Morning Chronicle* of London during 1849–50. In 1854 he was elected to the chair of the Latin language and literature at Oxford, that professorship having just been founded by Corpus Christi College. His tenure of the post, continued until his death, was markedly successful, and his "imposing personality" extended his influence far beyond his large circle of immediate pupils. His interests in connection with Latin studies were comparatively restricted. He cared little for ancient history, antiquities, or for many authors, even such great writers as Lucretius, Cæsar, Livy, and Cicero. But as a minute and careful interpreter of the more strictly literary aspects of Vergil, Horace, and Persius, and as an accurate, fluent, and generally very readable translator of all three, he gained a justly high repute. His translation (1866) of the *Æneid* in the ballad metre of Scott, though questioned by scholars as a representation of the manner of Vergil, is a vital piece of work and has been much read. The renderings (1863) of the *Carmina* of Horace, and in particular of the *Saturæ*, *Epistolæ*, and *Ars Poetica* of the same author (1869), won the critical esteem of the learned. His most important work is his edition of Vergil, begun in conjunction with Goldwin Smith, and finished by Prof. Henry Nettleship (*P. Vergill Maronis Opera—The Works of Virgil, with a Commentary*, 3 vols., 1858–70; 4th ed., 1881–84). His edition of Persius, with a remarkably idiomatic prose translation, appeared in 1872 (twice revised by H. Nettleship). He was also a Greek scholar of fine attainments and knew by heart the dramas of Æschylus, whose *Agamemnon* and *Choëphori* he edited (the former, with a verse translation and notes, 1848; the latter, 1857). Consult *The Miscellaneous Writings of John Conington*, ed. by J. A. Symonds (London, 1872), which contains a memoir by Prof. H. J. S. Smith.

CONINXLOO, kō'niŋks-lō'. A family of Flemish painters, of whom the most celebrated was GILLES III VAN CONINXLOO (1544–c.1607). He was born at Antwerp and studied under Pieter Coek, Lenaert Kroes, and Jan Mastaert. He practiced his art in France, but in 1587, on account of religious persecution, emigrated to Frankenthal and passed his later life in Amsterdam. Recent criticism reveals him as one of the most important Dutch landscape painters of the transition from the sixteenth to the seventeenth century. His development can be clearly followed in such pictures as "The Judgment of Midas" (Dresden) for the early period; two landscapes in the Ambrosiana, Milan—"Latona" (Hermitage, St. Petersburg), and a "Landscape with Venus and Adonis," showing his progress at Frankenthal; and a number of forest scenes with hunters or shepherds (Liechtenstein Gallery, Vienna, Stuttgart, Strassburg, Graz), illustrating his last manner. Martin van Cleef is said to have painted many of the figures for his landscapes, most of which were engraved by Nicolaes di Bruyn and Londerseel. Coninxloo exercised a strong influence on Jan Bruegel, Schonbroeck, Savery, and other Flemish and Dutch landscape painters of the transition period.

CO'NIUM. See HEMLOCK.

CON'JUGAL RIGHTS. The rights which a husband or wife possesses to the companionship, society, service, and affection of the other. For any unlawful invasion of these rights by a third party, the injured spouse has a claim against the wrongdoer. One who alienates the affection of a wife from her husband is liable to him in damages; and in many of the United States the same liability is incurred by a woman who alienates a husband's affections from his wife. A spouse who violates conjugal rights may thereby afford the other a valid ground for divorce. Such misconduct, however, does not give to the innocent spouse the right to inflict chastisement, or

to imprison the offender, or to obtain a decree for restoration of the conjugal relation. Both in England and in the United States the courts have declared that they have no jurisdiction to compel cohabitation where one party to the marital relation withdraws from the society of the other without justifiable cause, nor to enforce a restitution of conjugal rights withheld. In England, however, an ancient action, known as a suit for the restitution of conjugal rights, may still be maintained, but its only consequence is to furnish to the successful plaintiff grounds for a judicial decree of separation from the defendant. See COHABITATION; HUSBAND AND WIFE; MARRIAGE; DIVORCE; and authorities there referred to.

CONJUGA'TÆ, or POND SCUMS. See ALGÆ; CHLOROPHYCEÆ.

CON'JUGATE (Lat. *conjugatus*, p.p. of *conjugare*, to join together, from *com-*, together + *jugare*, to yoke, from *jugum*, yoke; connected with Gk. *ζυγόν*, *zygon*, OChurch Slav. *igo*, Lith. *jungus*, Goth. *juk*, Icel. *ok*, AS. *geoc*, Eng. *yoke*, OHG. *joh*, Ger. *Joch*, Skt. *yuga*, yoke). A term signifying "united in pairs" and having various uses in mathematics. Conjugate *roots* are numbers, real or imaginary, such as $a + \sqrt{b}$ and $a - \sqrt{b}$, or $a + bi$, $a - bi$, satisfying a given equation. (See COMPLEX NUMBER.) Conjugate *angles* are any two angles whose sum is 360°, as 10° and 350°, 400° and −40°, 180° and 180°. Conjugate *points* with respect to a conic are points each of which lies on the polar of the other. (See CIRCLE.) A conjugate *hyperbola* is one which has for its transverse and conjugate diameters the conjugate and transverse diameters of a given hyperbola. The equations of an hyperbola and its conjugate hyperbola are related thus: If $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ is the equation of the given hyperbola, then $\frac{x^2}{a^2} - \frac{y^2}{b^2} = -1$ is the equation of its conjugate. Conjugate *lines*, with respect to a conic, are lines each of which passes through the pole of the other. Conjugate *axes* or diameters of a conic are diameters which are conjugate lines with respect to the conic. Conjugate *triangles* with respect to a conic are triangles such that the sides of each are the polars of the vertices of the other and the vertices of each are the poles of the sides of the other. Conjugate *points* in a harmonic range are a pair of points harmonically separating two others. Thus, if A, P, B, Q, are four collinear points such that $AP : PB = AQ : BQ$, P and Q are called harmonic conjugates. Similarly in a harmonic pencil of four rays O ($APBQ$), OP and OQ are conjugate rays. (See ANHARMONIC RATIO.) Conjugate *elements* of a determinant (q.v.) are those elements which are symmetrically situated with respect to the principal diagonal. Certain forms of quantics are also called conjugate.

CONJUGATE FOCUS. See LIGHT.

CON'JUGA'TION (Lat. *conjugatio*, combination, from *conjugare*, to yoke together), IN PLANTS. A kind of fertilization, in which there is no visible difference between the male and the female cells (*gametes*). It is restricted to certain low forms of algæ and fungi (qq.v.). See FERTILIZATION.

CONJUGATION. A term in grammar applied to a connected view or statement of the changes of form that a verb (q.v.) undergoes in its various relations. (See INFLECTION.) The forms usually included under this term are those that serve to mark: 1. Person, or the distinction between the speaker, the spoken-to, and the spoken-of: as (I) *write*, (thou) *writest*, (he) *writes*. 2. Number; as (John) *writes*, (they) *write*. 3. Tense, or time; as (I) *write*, *wrote*, *have written*, *shall write*. 4. Mood, or the manner in which the action is presented. When the action is simply asserted, it is the indicative mood, as (he) *wrote;* when put as a supposition or condition, it is the conditional or subjunctive mood, as *if he wrote*. The imperative mood expresses a command or request, and is generally used only in the second person, as *write*. The infinitive mood expresses the action without limitation of any kind—*to write;* as it makes no affirmation, it is, strictly speaking, not a verb, but a kind of abstract noun. The two participles —the one expressing the action as in progress (*writing*), the other as completed (*written*)— may be classed with the infinitive, as not affirming anything. The infinitive and the participles are sometimes called verbals. In opposition to the infinitive and the participles, the other parts of the verb are called finite. 5. Voice, or distinction between active and passive (see VERB); as (he) *wrote* (the letter), (the letter) *was written* (by him).

In English, and in most modern European languages, the greater part of these distinctions are indicated by separate words; in Sanskrit, Greek, and Latin they were nearly all indicated by prefixes and suffixes, or other modifications of the word itself. The nature and origin of these modifications are considered under the head INFLECTION. All verbs do not take the same changes, even in the same language. Although the suffixes, e.g., may have originally been the same, yet they underwent, in course of time, different kinds of corruption or obliteration, depending upon the nature of the sounds in the root verb. This leads to the verbs of a language being arranged in different classes or conjugations. In Latin, e.g., grammarians recognize four conjugations, and verbs that cannot be brought into any class are called irregular verbs.

In English there are two distinct types of the inflections of verbs; thus, *I love* becomes in the past tense *I loved*, and in the passive voice *I am loved;* while *he shakes* becomes *he shook* and *he was shaken*. Verbs that, like *love*, take *d* (or *ed*—sometimes *t*) in their past tense and past participle form one class or conjugation, and those resembling *shake* in their changes form another. The former class is by far the more numerous; but the latter includes the most commonly used and oldest verbs in the language. The mode of change seen in *shake*, *shook*, *shaken* is believed to be more ancient than the other, and is therefore sometimes called the "old" conjugation, but more generally the "strong" conjugation, the other being the "new" or "weak." The terminology "regular" and "irregular" is incorrect. The verbs belonging to the old conjugation are all of Saxon origin and are primitive or root verbs; while derivative verbs belong to the other class. Verbs of the weak conjugation are pretty uniform in taking *d* or *ed*, although after certain sounds the *d* is of necessity pronounced as *t* and is sometimes replaced by that letter in writing—*dreamt*. For the vowel change in the strong conjugation, see ABLAUT. For further information on the conjugation of English verbs, consult: Lounsbury, *English Language* (rev. ed., New York, 1894); Emerson, *History of the English Language* (ib., 1894); Skeat, *Prin-*

ciples of English Etymology, vol. i (London, 1887); *Science of Etymology* (Oxford, 1912); Kaluza, *Historische Grammatik der englischen Sprache* (2d ed., 2 vols., Berlin, 1906); Jespersen, *Growth and Structure of the English Language* (Leipzig and New York, 1905); Krapp, *Modern English* (New York, 1909); Kittredge and Farley, *Advanced English Grammar* (Boston, 1913); and for language in general, Strong, Logeman, and Wheeler, *Introduction to the Study of the History of Language* (New York, 1891). See GRAMMAR; INFLECTION.

CONJUNC'TION (Lat. *conjunctio*, from *conjungere*, to join together, from *com-*, together + *jungere*, to join; connected with Lat. *jugum*, yoke). One of the *parts of speech*, or classes into which grammarians divide words. Conjunctions serve the purpose of connecting sentences, parts of sentences, and single words; as "Day ends, *and* night begins. William *and* John learn Latin. Charles *and* James carried the basket between them." In the first sentence *and* connects two separate affirmations into one compound sentence. The same is true in the second —the separate affirmation being, "William learns Latin," and "John learns Latin." In the third sentence *and* connects only the two words "Charles" and "James," as it cannot be affirmed of either of them alone that he "carried the basket." In most cases, however, it can be shown that, logically at least, two affirmations are involved, and that the conjunction really connects the affirmations. Conjunctions may also connect paragraphs. It is not easy to distinguish conjunctions from adverbs. In fact, conjunctions were all originally other parts of speech; and the greater part of them are still really adverbs and owe their conjunctive effect to their signification as adverbs. In *and* and *but*, whatever may have been the original meaning, we now attend only to the conjunctive effect; *or* is a shortened form of the pronominal adjective *other;* and *nor* is *or* with the negative prefixed. In such a sentence as "I believe that you are wrong," *that* is the demonstrative pronoun, equivalent to—I believe *this*, viz., "you are wrong." This is clearly seen in the corresponding words in other languages: Ger. *dass*, Fr. *que*, Lat. *quod* (for the relatives were originally demonstrative pronouns). All the rest might be called adverbial conjunctions, or conjunctive adverbs; as, "He is industrious; *therefore* he is happy"—i.e., "he is happy *for that*." This adverb, or adverbial phrase, expressive of the cause of the happiness, by referring us back for its meaning to the former assertion, has the effect of connecting the two assertions in the mind. Again, "The messenger arrived *while* he was speaking." Here *while* is equivalent to *at the time at which* (he was speaking). As an adverbial phrase, this simply indicates the time of the act of "arriving"; but as it also expresses that the speaking was going on at the same time, it thus conjoins the two assertions.

The most important distinction among conjunctions will be seen in the following pair of sentences:

> The sun went down, *and* the moon rose.
> The moon rose, *as* the sun went down.

The first (compound) sentence contains two simple sentences or assertions, linked together, yet each standing on an independent footing; the two are joined on terms of equality and are therefore said to be *coördinate*, and the conjunction is called a coördinating conjunction. In the second (complex), the last clause, though a grammatical sentence, contains no logical proposition, no assertion made for its own sake, but merely states a fact as a modifying circumstance with regard to the assertion contained in the first clause. The sentence of the second clause is therefore *subordinate* to that of the first, and the conjunction that marks the relation is a subordinating conjunction. Other kinds of conjunctions are *comparative*, which express equality or difference of degree (e.g., *as, than, just as, as if*, etc.); *conditional*, expressing a condition (*if, unless*, etc.); *copulative* (q.v.), *adversative* (*but, though*), which contrast; *illative* (*therefore*), where the second sentence or clause is an inference from the first; *temporal*, where a time relation is expressed; and so forth.

CONJUNCTION. In astronomy, one of the aspects (q.v.) of the planets. Two heavenly bodies are in conjunction when they have the same longitude, i.e., when the same perpendicular to the ecliptic passes through both. If they have at the same time the same latitude, i.e., if they are both equally far north or south of the ecliptic, they appear from the earth to be in the same spot of the heavens and to cover one another. This phenomenon is called an eclipse in the case of the sun and moon, and an occultation in the case of the moon and a star. The sun and moon are in conjunction at the period of new moon. In the case of inferior planets, like Mercury and Venus, which revolve in orbits interior to that of the earth, there is an inferior conjunction when the planet is between the earth and the sun, and a superior when the sun is between the earth and the planet. In general, a heavenly body is in *conjunction* with the sun when it is on the same side of the earth and in a line with the sun; and it is in *opposition* to the sun when it is on the opposite side of the earth, the earth being in a line between it and the sun. Planets are invisible when in conjunction with the sun, except in rare cases when an inferior planet passes over the sun's disk and may be seen as a dark speck on its surface. The foregoing has reference to *geocentric* conjunctions, or such as are seen from the earth. *Heliocentric* conjunctions are analogous planetary arrangements, such as could be seen by a supposed observer on the sun. In observing a conjunction, eclipse, or occultation, from the earth's surface, it is usual to reduce the observation to what it would be if made from the earth's centre. By this means the exact time of conjunction is more accurately fixed, and it becomes unnecessary to specify the station at which the observation was originally made, the time merely requiring a local correction to render it available at any other station where it may be needed. *Grand conjunctions*, in astrology, are those where several stars or planets are found together. Chinese history records one in the reign of the Emperor Tehuenhiu (2514–2436 B.C.), which astronomers calculate to have actually taken place.

CONJUNC'TIVI'TIS (Neo-Lat., from *conjunctiva*, connective membrane, from Lat. *conjunctivus*, connective, from *conjungere*, to join together), OPHTHALMIA, or OPHTHALMITIS. An inflammation of the conjunctiva, or the mucous membrane that covers the external surface of the eyeball, and the internal surface of the eyelids. The disease occurs in several distinct varieties, which are separately described below:

Acute Catarrhal Conjunctivitis. The symp-

toms of this variety are redness of the surface of the eyes (the redness being superficial, of a bright scarlet color, and usually diffused), sensations of uneasiness, stiffness and dryness, with slight pain, especially when the eye is exposed to the light; an increased discharge, not of tears, except at the beginning of the attack, but of mucus, which at first is thin, but soon becomes opaque, yellow, and thick; pus (matter) being seen at the corner of the eye, or between the eyelashes along the edges of the lids, which it glues together during the night. The disease results from exposure to cold, damp, and dust containing bacteria; it may be transmitted by contact with articles used by those having the disease; or may follow or occur during measles, smallpox, scarlet fever, influenza, hay fever, or coryza.

Chronic Catarrhal Conjunctivitis. This is probably the most common disease of the eye and usually occurs in adults, generally involving both eyes. It often lasts a long time, frequently on account of the continuance of the causes which led to its appearance. Among the most important causes are: acute catarrhal conjunctivitis, improper hygienic surroundings, irritation by dust or smoke, insufficient sleep, abuse of alcohol, and eye strain. The conjunctiva is red and smooth, the secretion is but slightly increased.

Follicular Conjunctivitis. This is an obstinate form of chronic catarrhal conjunctivitis and may be recognized by the small follicles or granular swellings which form upon the lower lids. It closely resembles trachoma (see *Granular Conjunctivitis*, below), commonly called "granular lids," and some even maintain that they are identical.

Acute Purulent Conjunctivitis of Adults, or *Gonorrhœal Ophthalmia.* This differs from catarrhal conjunctivitis in the severity of its symptoms and in its exciting causes. It is a violent form of inflammation of the conjunctiva, is accompanied with a thick, purulent discharge on the second or third day, and is very apt to occasion loss of vision. It begins with the same symptoms as catarrhal ophthalmia, but the conjunctiva becomes intensely swollen, red, and elevated from the sclerotic projecting around the cornea. Similar swelling takes place in the mucous membrane lining the eyelids, causing them to project forward in large, livid, convex masses, which often entirely conceal the globe of the eye. These symptoms are accompanied by severe pain, tenderness of the eye, and slight fever. When the disease is unchecked, it is liable to produce ulceration or sloughing of the cornea, with the escape of the aqueous humor and protrusion of the iris; and, even when these results do not follow, vision is often destroyed by permanent opacity of the cornea.

The disease is unquestionably contagious and arises from the application of gonorrhœal discharge or matter to the surface of the eye by means of towels or fingers, and hence is most common in persons suffering from the disease from which this variety obtains its specific name.

Purulent Conjunctivitis of Infants, or *Ophthalmia neonatorum.* This usually appears about the third day after birth. It is apt to be overlooked until it has made considerable progress. The disease gives rise to the same symptoms and, if not checked, progresses in much the same way as in adults. It is, however, more amenable to treatment, and with proper care sight is seldom impaired, provided the disease has not extended to the cornea before medical aid is sought. *Ophthalmia neonatorum* is the result of gonorrhœal infection of the eyes from the mother during birth. It is practically preventable by the use of Credé's method of cleansing the eyes immediately after birth, and putting one drop of a 2 per cent solution of silver nitrate into each eye. This is a routine practice in many of the maternity hospitals and has done much in these institutions and among the better classes to diminish the frequency of the affection.

Diphtheritic Conjunctivitis and **Croupous Conjunctivitis.** These are forms caused by the bacillus of diphtheria.

Phlyctenular Conjunctivitis, called also *Pustular Conjunctivitis,* or *Scrofulous Ophthalmia.* This occurs in children, especially of the lower classes, who suffer from the tuberculous or so-called scrofulous diathesis or constitution. The cornea is generally involved in the process. The most prominent symptom is extreme intolerance of light, the lids being kept spasmodically closed. When they are forcibly separated, a slight vascularity, usually stopping at the edge of the cornea, is observed, and at or about the line of separation between the cornea and sclerotic small opaque pimples or pustules appear. Treatment consists in improving the general health and in appropriate local applications. This form of disease, being dependent on constitutional causes, is often very obstinate and is liable to recur.

Granular Conjunctivitis, *Trachoma,* or "granular lids." This is a contagious affection of the eye, most frequently carried by towels, etc., used in common by many persons, and therefore found chiefly in crowded and dirty houses, in schools, barracks, etc. It occurs very frequently in Arabia, Egypt, and the lowlands of Europe. In this country the negro race is seldom affected. The disease has been called Egyptian ophthalmia on account of its importation into Europe from Egypt during the wars of Napoleon. It is accompanied by itching and burning of the lids, pain, flow of tears, and, in the advanced cases, with poor vision. The lids are swollen, the upper drooping; there is a variable amount of mucopurulent discharge. The conjunctiva of the lids and fornix, or fold between lids and eyeballs, is red, thickened, and covered with many small papillæ, or velvety elevations, or by granules which are round, translucent, and yellow or grayish. After a time scar tissue forms, and the papillæ and granules disappear. The disease may be acute, but usually begins gradually and lasts for years. The dangerous complications are ulceration of the cornea alone or accompanying a condition known as *pannus.* In the latter, new tissue containing blood vessels gradually forms until the cornea is covered partially or wholly. If this disappears later, sight will be restored; otherwise the new tissue causes permanent opacity, an accident which may also result from corneal ulceration. Entropion (q.v.), trichiasis (q.v.), ectropion (q.v.), or symblepharon, a cicatricial adhesion of the conjunctiva of the lid to that of the eyeball, may follow trachoma. Among numerous other varieties of conjunctivitis two forms require mention, viz., simple follicular conjunctivitis, and vernal catarrh, both of which are accompanied by the appearance of granules or follicles and are frequently mistaken for true trachoma.

The treatment may require either local applications or surgical interference. Prevention is most important. Persons having the disease should exercise great care that others may not use their towels or other toilet articles which might serve to convey it, and in public institutions cases should be carefully watched for and isolated.

CONJURY, kŭn'jēr-ĭ (from *conjure*, OF., Fr. *conjurer*, from Lat. *conjurare*, to swear together, from *com-*, together + *jurare*, to swear, from *jus*, law). Incantation, bewitchment, or magic. Specifically, the casting of spells, or evil enchantment, characteristic of Afro-American folklore. See MAGIC.

CONKLIN, EDWIN GRANT (1863–). An American zoölogist, born at Waldo, Ohio, and educated at Ohio Wesleyan and Johns Hopkins universities. He was professor of biology at Ohio Wesleyan (1891–94) and professor of zoölogy at Northwestern (1894–96), the University of Pennsylvania (1896–1908), and Princeton (after 1908). He became coeditor of the *Journal of Morphology*, the *Biological Bulletin*, and the *Journal of Experimental Zoölogy*. He was president of the American Society of Zoölogists in 1899 and president of the American Society of Naturalists in 1912.

CONK'LING, ROSCOE (1829–88). An American politician. He was born at Albany, N. Y., and, after receiving an academic education, at the age of 17 began the study of law in the office of Spencer and Kernan at Utica. His first identification with politics was in 1848, when he won some reputation as a campaign speaker by making a number of speeches in behalf of Taylor and Fillmore. In 1850 he was admitted to the bar, and in the same year became district attorney of Albany County by appointment of Governor Fish. In 1852 he returned to Utica, where in the next few years he established a reputation as a lawyer of ability. Up to 1852, in which year he stumped New York State for Gen. Winfield Scott, the Whig candidate for the presidency, Conkling was identified with the Whig party, but in the movement that resulted in the organization of the Republican party he took an active part, and his work, both as a political manager and an orator, contributed largely towards carrying the State for Frémont and Dayton, the Republican nominees, in 1856. In 1858 he was elected mayor of Utica, and in the same year was chosen a Representative in Congress, serving throughout the period of the Civil War, except in the Thirty-eighth Congress (1863–65), during which interval he acted as a Judge Advocate of the War Department. He was again a member of Congress in 1865–67. In his career in the House of Representatives Conkling won national distinction as a debater and orator. He was an enthusiastic supporter of the Lincoln administration in its conduct of the war, but vigorously opposed the passage of the Legal Tender Act in 1862. He was a member of the Committee of Ways and Means, and the Special Committee of Fifteen on Reconstruction, delivering one of the strongest speeches in support of the Fourteenth Amendment. His renown as an orator and prominence in the legislative councils of the Republican party secured him in 1867, at the age of 38, an election to the United States Senate to succeed Judge Ira Harris. Conkling's career in the Senate was brilliant, but, like all the rest of his political life, erratic and marked by strong personal likes and dislikes, by which, rather than by regard for the welfare of the nation or of his party, he was frequently controlled. Through the eight years of Grant's administration he stood out as the spokesman of the President and one of the principal leaders of the Republican party in the Senate. He was active in framing and pushing through Congress the reconstruction legislation, and was instrumental in the passage of the second Civil Rights Act, in 1875, and of the act for the resumption of specie payments, in the same year. In the Republican National Convention at Cincinnati in 1876, Conkling first appeared as a presidential candidate, receiving 93 votes. He was one of the framers of the bill creating the Electoral Commission to decide the disputed election of 1876, but, when its judgment was announced, declined to vote for its affirmation. Himself an opponent of civil service reform, Conkling was entirely out of sympathy with the reform element in the Republican party. The first break with the administration occurred in April, 1877, when the Secretary of the Treasury, John Sherman, appointed a commission to investigate the affairs of the customhouse. The investigation brought to light extensive irregularities in the service, showing in particular that the Federal officeholders in New York constituted a large army of political workers, and that their positions were secured by and dependent upon their faithful service in behalf of the men holding the principal government offices in the city. President Hayes decided upon the removal of Chester A. Arthur, the collector, Gen. George H. Sharpe, the surveyor, and A. B. Cornell, the naval officer of the port, and in October, 1877, sent nominations of their successors to the Senate. Senator Conkling defended the displaced officials, and, through his influence in the Senate, secured the rejection of the new nominations. He succeeded in blocking all the efforts of President Hayes and Secretary Sherman until January, 1879, when, a new lot of nominations having been made, they were confirmed in spite of Conkling's continued opposition. Early in 1880 Senator Conkling became the leader of the movement for the nomination of General Grant for a third term in the presidency. How much of his advocacy was due to his regard for Grant, and how much to his hostility to the two other leading candidates—Sherman, with whom he had come into conflict during Hayes's administration, and Blaine, whose bitter political and personal enemy he had been for 24 years—can never be known. The convention, by a combination of the Blaine and Sherman interests, nominated James A. Garfield. Conkling and the famous "306" remained faithful to Grant to the last and were allowed to name the candidate for Vice President. The result emphasized Conkling's hostility towards Blaine and eventually led to the former's quarrel with Garfield and consequent retirement from political life. Immediately after Garfield's inauguration, Conkling presented to the President a list of men whom he desired to have appointed to the Federal offices in New York. Garfield's appointment of Blaine as Secretary of State, and of Windom as Secretary of the Treasury, instead of Levi P. Morton, whose appointment Conkling had urged, angered Conkling and made him unwilling to agree to any sort of compromise with Garfield on the New York appointments. Without consulting him, the President nomi-

nated for the collector at New York William H. Robertson, an anti-Conkling man. Robertson's nomination was confirmed by the Senate, in spite of the opposition of Conkling, who claimed the right of Senators to control Federal patronage in their States. Conkling and his colleague, Thomas C. Platt, immediately resigned their seats in the Senate and appealed to the New York Legislature to justify their course by reëlecting them. After an exciting canvass Conkling and Platt were defeated, and Warner Miller and E. G. Lapham were chosen in their stead. The remainder of his life Conkling spent in the practice of law in New York City. In 1882 he was nominated by his friend, President Arthur, to succeed Ward Hunt as an associate justice of the United States Supreme Court, but he declined. Consult *Life and Letters*, edited by A. R. Conkling (New York, 1889).

CONN. An irresponsible, gay-spirited fellow, the leading character in Dion Boucicault's play *The Shaughran.*

CONN, HERBERT WILLIAM (1859–1917). An American zoölogist and bacteriologist, born at Fitchburg, Mass. He took his baccalaureate degree at the Boston University and his doctorate at Johns Hopkins University, and soon afterward became professor of biology at Wesleyan University in Connecticut. From 1889 to 1897 he was director of the Marine Biological Laboratory at Cold Spring Harbor, L. I. He is considered an authority on the bacteriology of dairy products, in connection with which he published many papers (1890–1905) under the auspices of the Agricultural Station at Storrs, Conn. In 1905 he became bacteriologist of the Connecticut State Board of Health and director of the State laboratory. His works include: *Evolution of To-Day* (1886); *The Living World* (1891); *The Study of Germ-Life* (1897); *Classification of Dairy Bacteria* (1899); *The Method of Evolution* (1900).

CONNAUGHT, kŏn'nąt (Ir. *Connacht*). The northwestern and smallest of the four provinces of Ireland, bounded north and west by the Atlantic Ocean, east by Ulster and Leinster, and south by Munster (Map: Ireland, B 3). It contains the counties of Galway, Leitrim, Mayo, Roscommon, and Sligo. Area, 6571 square miles. Pop., 1841, 1,420,900; 1891, 719,500; 1901, 646,932; 1911, 595,040.

CONNAUGHT, ARTHUR WILLIAM PATRICK ALBERT, DUKE OF, Prince of the United Kingdom (1850–). The third son of Queen Victoria. He entered the Military Academy at Woolwich in 1866 and in 1880 became a major general. He was created Duke of Connaught and Strathearn and Earl of Sussex in 1874 and took his seat in the House of Lords. In 1879 he married Princess Louise Marguerite of Prussia. He served in Egypt in 1882, became a general in 1893, and from 1893 to 1898 was in charge of the permanent camp at Aldershot. In 1896 he represented Queen Victoria at the coronation of the Czar Nicholas II and in 1903 was the representative of Edward VII at the coronation durbar at Delhi. He succeeded Lord Roberts as commander in chief of the forces in Ireland in 1900, became field marshal in 1902 and inspector general of the forces in 1904, and was commander in chief in the Mediterranean in 1907–09. In October, 1911, he arrived in Quebec as Governor General of Canada. In 1914 Prince Alexander of Teck, Queen Mary's brother, was appointed as his successor. The Duke's children include the Crown Princess of Sweden (born 1882), Prince Arthur (born 1883), who married the Duchess of Fife in 1913, and Princess Victoria Patricia (born 1886), popularly known as "Princess Pat."

CONNEAUT, kŏn'nê-ąt'. A city on Conneaut Creek, Ashtabula Co., Ohio, 68 miles by rail northeast of Cleveland, noted as the landing place of the first white settlers of northern Ohio in 1796 (Map: Ohio, J 2). It is on the Lake Shore and Michigan Southern, the New York, Chicago, and St. Louis, and the Bessemer and Lake Erie railroads, and has a good harbor at the mouth of the creek, where there is a lighthouse. It is an important ore and coal port, being noted for its exceptional facilities for handling large cargoes. There are extensive railroad shops and manufactories of canned goods, self-sealing packages, bricks, shovels, leather, lumber, etc. Conneaut also exports molding sand and farm produce. The city contains three hospitals, a Carnegie library, and a public park. The electric-light plant is owned and operated by the city, which was first incorporated in 1832. It is governed by a mayor, elected biennially, assisted by a council. Pop., 1890, 3241; 1900, 7133; 1910, 8319.

CONNECTICUT, kŏn-nĕt'ĭ-kŭt (Algonquin *Quinni-tuk-ut*, long river). One of the original thirteen States of the United States; a north Atlantic coast State and the southwesternmost of the New England States (Map: United States, L 2). It is included between lat. 40° 59′ and 42° 3′ N. and long. 71° 47′ and 73° 43′ W., and is bounded on the north by Massachusetts, on the east by Rhode Island, on the south by Long Island Sound, and on the west by New York. It has an extreme length from east to west of nearly 105 miles, and an average length of about 95 miles: an extreme width from north to south of 76 miles, and an average width of 57 miles, with a total area of 4965 square miles, of which 145 square miles are water surface. Connecticut is one of the smallest States in the Union, only two States being smaller, but it ranks thirty-second in population. The boundary lines between Connecticut and the adjoining States are somewhat irregular, since they depend on old grants and surveys which were very unsystematic.

Topography. The area of Connecticut may be divided into three parts, a western highland and an eastern highland and between them a central lowland. The central lowland is everywhere less than 500 feet in altitude, with the exception of a longitudinal hill range, which in its southern part is broken into detached portions arranged in echelon, and two or three shorter hill ranges near the western border. From the northern boundary of the State, as far as Middletown, that central lowland is traversed by the Connecticut River. From Middletown to Long Island Sound the Connecticut River traverses a corner of the eastern highland in a narrow gorge. The Connecticut River is a tidal estuary from its mouth to a point beyond Hartford; and, at the northern boundary of the State, the flood plain of the Connecticut has an altitude less than 60 feet. With the exception of the hill ranges above referred to, the whole central lowland is an area of very slight relief. In strong contrast with the central lowland the western and eastern highlands are exceedingly rugged, showing substantially no level tracts ex-

cept the narrow flood plains and terraces of the rivers. The highest altitudes of the State are near the northwest corner, Bear Mountain attaining an altitude of 2355 feet, and Gridley Mountain an altitude of 2200 feet. Both of these are in the town of Salisbury. The culminating points of the eastern highland are only about half as high as those of the western highland. Bald Hill in Union is 1285 feet in altitude, and Snow Hill in Ashford 1213 feet. The rivers flow through these rugged highlands in narrow valleys. Both the eastern and western highlands rise pretty abruptly from the surface of the central lowland, so that from points in the lowland the view either eastward or westward is bounded by what appears to be a mountain wall. In spite of the absence of level country in the highlands, it is noteworthy that from almost any point of view the sky line appears straight and almost horizontal. Most of the culminating points of the highlands, and also the summits of the hill ranges within the central lowland, may be conceived to touch an imaginary inclined plain sloping gently southeastward from the northwest corner of the State. The topography accordingly suggests that the eastern and western highlands are both remnants of an uplifted and tilted peneplain, in which have been carved by erosion the broad central lowland and the narrow highland valleys. The topographic difference between the highlands and the lowland results from the geological structure, the highland rocks being strong and the lowland rocks weak. The eastern and western highlands are simply the south end of the general highland of central and western New England. While the whole area of Connecticut appears at one time to have been eroded nearly to a base-level plain, the surface of the region farther north seems never to have been so completely peneplained, some isolated summits, like Wachusett and Monadnock and the great mountain mass of the White Mountains, having never been degraded to the general level. Between the highlands of New Hampshire and Vermont the Connecticut River flows in a narrow valley, the soft rocks which have permitted the erosion of the broad central lowland of Connecticut not extending so far north as the northern boundary of Massachusetts.

The coast of Connecticut is very broken and irregular and consists of a succession of rocky points and gravel or sandy beaches. It possesses a number of good harbors, and the larger rivers have estuary-like mouths. The coast waters are shallow, but usually deep enough to permit vessels to come close to land. Numerous small rocky islands skirt the shores; the largest island on this coast being Fisher's Island, off the mouth of the Thames, which, while geographically belonging to the Connecticut coast, politically belongs to New York.

The hydrography of Connecticut is simple in general outline, the streams for the most part following the slope of land from the north towards the south. Since this slope is but a continuation of the higher land to the north, the main streams rise north of the Connecticut boundary, and the waters flow in a generally southerly direction across the State and empty into Long Island Sound. There are three main river systems—the Housatonic-Naugatuck in the west, the Connecticut in the middle, and the Thames in the east. The streams tributary to these main rivers are numerous, and some of them are of considerable size. In the southern part of the State there are many small streams which have a southerly direction and flow straight to the Sound. Few of these small streams are more than 25 miles in length in a direct course. The Connecticut watercourses have in general deeply cut their paths through the highlands, so that on the main streams the fall is less than might be expected from the neighboring elevations. The smaller streams, however, and the larger ones in their upper courses, furnish a large supply of water power.

Geology. The rocks of the highlands are highly crystalline. Gneisses and mica schists are the most abundant, though in the western part of the State there are some bands of crystalline limestone or marble, and in various parts of the State are found some crystalline rocks of more basic constitution than the prevalent gneisses and schists. The gneisses often grade into granite and are often cut by intrusive masses of granite. These crystalline rocks are all pre-Triassic in age, but how much is pre-Cambrian and how much is Paleozoic is not known. So complete has been the metamorphism that no vestiges of fossils have yet been found in any part of the crystalline areas of Connecticut. Some of the formations of the western part of the State have been traced into the adjacent States of Massachusetts and New York, and their stratigraphic position has been fairly well established. The marbles of the western border are of Cambrian and Ordovician age. Certain others of the rocks of the western highland have been definitely recognized as respectively pre-Cambrian, Cambrian, and Ordovician. In regard to most of the rocks of the western highland, and all, or nearly all, the rocks of the eastern highland, nothing more definite can be said than that they are pre-Triassic. The area of Connecticut was doubtless affected by the orogenic movements of pre-Cambrian, post-Ordovician, and post-Carboniferous times, and how much of the disturbance and metamorphism which the rocks have suffered is due to each of these revolutions cannot now be determined. The last of these orogenic movements left mountain areas of considerable elevation in eastern and western Connecticut; between which lay a broad geosynclinal depression, where now is the central lowland of the State. In this trough were deposited the Triassic rocks which are now the surface rocks of that area. These rocks are chiefly red sandstones, varying into shales and conglomerates. None of the deposits are marine. How much respectively is estuarine, fluvial, lacustrine, pluvial, and æolian, is not definitely known. About the middle of the period of Triassic deposition was an epoch of vulcanism. Intrusive sheets of igneous rock came to be intercalated among the lower strata, while three great lava sheets at comparatively short intervals found their way to the surface, each in its turn to be covered by later sediments. The second of these lava sheets was a massive one, several hundred feet in thickness. At the close of the Triassic a broad geanticlinal uplift, whose axis was near the western border of Connecticut, uplifted and tilted the sandstones, giving them a general dip to the east. This elevation was accompanied with considerable faulting of the strata. During the later Mesozoic the area of Connecticut suffered a great amount of erosion, and, by the close of Mesozoic time, the crystalline and the Triassic areas alike were reduced to a peneplain. In early Tertiary time this

peneplain was uplifted so as to attain in the northwestern corner of the State an altitude of about half a mile, from which it sloped gently towards the southeast. The present topography was carved in Tertiary time out of this tilted peneplain. The broad central lowland was excavated in the weak Triassic rocks. The outcrops of the lava sheets and of the intrusive sheets of igneous rock determined the location of the hill ranges of the central lowland. The faulting of the strata broke the continuity of those outcrops and gave the resultant ridges their echelon arrangement. In the regions of the hard crystalline rocks the streams have been able to excavate only narrow valleys, and the culminating points of the dissected plateau retain approximately the altitude of the tilted peneplain.

Connecticut was covered by the ice of the Glacial period. While the rocks everywhere bear the characteristic marks of glacial scouring, it is not believed that the general topography of the State was in any considerable degree altered by glacial erosion. The effects of glacial deposition, covering the whole area of the State with an irregular mantle of drift, are seen in innumerable lakes and ponds. Disturbances of drainage by glacial deposition have resulted in the formation of numerous waterfalls. A very remarkable example of change of drainage due to the events of the Glacial period is shown by the streams in the western part of the central lowland. Prior to the Glacial period a single river flowed southward from near the northern boundary of the State to New Haven Bay. The course of that river is now represented by parts of the Farmington, Pequabuck, Quinnipiac, and Mill. The inlets and harbors of the Connecticut coast are due to a slight post-Glacial depression which drowned the south ends of the valleys.

Climate and Soil. In Connecticut the average annual temperature decreases from about 50° F. on the south coast to about 48° in the northeast and 46° in the northwest. In midwinter the average temperatures decrease from about 30° along the south coast to 24° in the north. In all portions of the State the temperature usually descends below zero at times during the winter and may even fall as low as —10° or —15° F. In midsummer the average temperature is about 72° along the south coast, but increases to 74° in the middle interior, and decreases again to about 70° in the northwest. During the summer extreme temperatures ranging from 90° to 100° F. may be expected in all parts of the State.

The prevailing winds in Connecticut are from the westward. In the winter the prevailing wind throughout most of the State is from the northwest, and in midsummer from the southwest. The prevalent southwest winds during the summer months considerably lower the land temperatures on the south coast and to some distance inland, while the prevalent northwest winds during the winter carry the inland cold air to the coast. The monthly mean value of relative humidity varies from about 60 to about 80 per cent, and is generally a little less in the spring than at other times of the year, though the variation is very irregular. Throughout most of the State the average rainfall during the year is from 45 to 50 inches. The precipitation is extremely irregular, but on the average not very unequally distributed among the months of the year. The snowfall varies very much from year to year, but on an average for a series of years about 40 inches fall on the south coast, and there is a rather regular increase towards the northern part of the State to 50 inches in the northeast corner and to 60 inches in the northwest corner.

The valley land of Connecticut is usually a rich alluvial deposit. The higher ground is mostly covered with glacial till, affording a stony soil, much of which is well adapted for forestry, fruit growing, and pasturage. The northern part of the Connecticut River valley, as far south as Middletown, has a rich, deep, loamy soil, often with a clay subsoil. In the southern part of the State the soil is sandy, as also along the coast, which extends for about 100 miles and is broken by numerous small bays.

Mining. Connecticut has small importance as a producer of minerals, the total value of the mineral products being less than $4,000,000 annually, and of this approximately 80 per cent is derived from quarries and clay products. An inconsiderable quantity of iron ore is mined, and a small quantity of pig iron is made, but aside from that there is in the State no metal mining nor any production of mineral fuel. The quarrying industry in 1912 yielded products valued at $1,467,458, compared with $1,215,462 in 1911. The principal stone quarried is designated in the trade as granite, although much of the material quarried under the name of granite is gneiss. Quarrying of trap rock is also an important industry, and the value of the output of this in 1912 was about 75 per cent of that of granite or gneiss. Granite is quarried in every county, but the principal operations are in New Haven and New London counties, and there are others of considerable importance in Windham and Fairfield counties. Trap rock is produced chiefly in Hartford and New Haven counties. In addition to granite and trap rock, commercial quarries of red sandstone are operated at Hartford, Middlesex, and New Haven counties, and some marble has been produced in Litchfield County. Clay-working establishments are located chiefly in the Connecticut River valley. The product consists chiefly of common brick, which represents nearly 90 per cent of the total output of clay. Clay products were valued in 1912 at $1,507,787, compared with $1,284,106 in 1911. Lime, valued at $371,356, was produced in 1912, compared with the value of $328,904 for the product of 1911. The lime-producing counties are Fairfield and Litchfield in the extreme western part of the State. Connecticut is the third State in the Union in the production of feldspar. The output in 1912 amounted to 19,075 short tons, valued at $94,097, compared with 16,497 short tons, valued at $73,557 in 1911. Other commercial mineral products are infusorial earth, mineral waters, quartz, sand-lime brick, sand, and gravel. The total value of the mineral products of the State in 1912 was $3,716,480, compared with $3,151,588 in 1911.

Agriculture. Practically all the soils of the State are derived, either directly or indirectly, through the glaciation of the numerous varieties of underlying rock. The highland portions have been chiefly swept bare of the finer soil-forming material at all of the higher altitudes and upon the more precipitous slopes. The lower slopes and the more gently rolling portions of the highlands are deeply covered with complex glacial débris known as "till." This gives rise

chiefly to stony, sandy loams and stony loams, with smaller areas of heavier loam. Within the Connecticut River basin and in all the smaller valleys found within both portions of the highland, there were deposited gravels, sands, sandy loam, and clays at the time of the recession of the glacial ice. These more level portions constitute some of the best agricultural lands within the borders of the State. Upon the sandy loams and the loamy soils the tobacco industry, the market gardening, and a considerable part of the fruit industry are carried on. The upland soils are chiefly used for grazing and the production of grass and corn. Extensive areas are too steep in slope or too rocky for any other occupation than that of forestry or pasturage. The growing horticultural interests of the State are located chiefly upon the deeper areas of the glacial loams in the highland portions. That agriculture has not progressed in recent years is shown by the figures of the thirteenth census taken in 1910, compared with those of the census of 1900. In 1910 the total number of farms in the State was 26,815, while in 1900 it was 26,948—a decrease of 133 in the decade. Of the total land area of approximately 3,084,800 acres, there were in 1910 in farms 2,185,788 acres, while in 1900 there were 2,312,083—a decrease of 126,295 acres in the decade. The improved land in farms in 1910 was 988,252, while in 1900 it was 1,064,525 acres—a decrease of 76,273 acres. The average acres per farm in 1910 were 81.5, compared with 85.8 in 1900. The total value of farm property in 1910 was $159,399,771, compared with the value in 1900 of $113,305,580. This valuation includes land, buildings, implements and machinery, domestic animals, poultry, and bees. The average value of all property per farm in 1910 was $5944, and in 1900, $4205. In 1910 the average value of land per acre was $33.03, and in 1900, $22.68. Of the total number of farms in the State, in 1910, 24,183 were operated by owners and managers, and 2632 by tenants. In 1880 about 10 out of every 100 farms in the State were operated by tenants. This proportion increased during the next 20 years, until in 1900 about 13 farms in every 100 were operated by tenants. In the succeeding decade the movement was reversed, and the tenancy in 1910 was a little less frequent than in 1880. Of the farms owned in 1910, 13,080 were free from mortgage and 9058 were mortgaged. The average debt per farm in 1910 was $1309, and the average equity per farm was $2874. The largest number of Connecticut farms are from 50 to 99 acres. Changes during the last decade have been in the direction of increases in the relative number of smaller farms at the expense of the relative number of larger ones. In 1910 three out of every four Connecticut farmers were native whites, and one out of every four was a foreign-born white. The native white farmers numbered 19,841, and the foreign-born 6801. The negro and other non-white farmers numbered 113. Of the foreign-born white farmers, 1538 were Germans, 1164 Irish, 676 Russians, 675 Swedish, 551 English, 544 Austrian, 396 Canadian, 319 Italian, 191 Hungarian.

The general character of the agriculture of the State is indicated by the fact that only about nine per cent of the total value of crops is contributed by the cereals, while nearly one-third is contributed by hay and forage, nearly one-sixth by tobacco, and about one-sixth by potatoes and other vegetables, the remainder, representing in value about 22 per cent of the total, consists mostly of forest products, fruits and nuts, flowers and plants, and nursery products. The acreage, production, and value of the principal crops in 1909 and in 1913 are shown in the table below. The figures for 1909 are from the thirteenth census, while those for 1913 are estimates made by the United States Department of Agriculture.

PRODUCTS		Acreage	Product bu.	Value
Corn	1913	61,000	2,348,000	$1,966,000
	1909	52,717	2,530,542	1,693,939
Oats	1913	11,000	308,000	169,000
	1909	10,207	273,804	161,188
Rye	1913	7,000	135,000	124,000
	1909	7,601	137,692	123,848
Potatoes	1913	24,000	2,208,000	1,921,000
	1909	23,959	2,684,414	1,882,197
Hay	1913	379,000	432,000*	8,683,000
	1909	401,322	549,366	7,224,500
Tobacco	1913	18,400	28,520,000†	5,989,000
	1909	16,042	28,110,453	4,415,948

* Tons † Pounds.

As will be noted from this table, by far the most important product of the State is hay and forage, and the second in value is tobacco. Potatoes, with an acreage of about 50 per cent above that of tobacco, show a value hardly one-third as great. The acreage of corn decreased very greatly from 1879 to 1889, but since the latter date it has shown considerable increase. Oats decreased in acreage from 1870 over 72 per cent, although there was a slight increase from 1899 to 1909. During the last decade the increases in acreage are in tobacco, corn, and oats; decreases in acreage are in rye, buckwheat, hay and forage, and potatoes. The cultivation of tobacco was begun in 1640, if not earlier, and it is confined chiefly to the valleys of the Housatonic and Connecticut rivers. The tobacco, which is of a superior quality and of a mild flavor, is used chiefly for wrappers for cigars made from the stronger-flavored Havana tobacco.

The growing of vegetables is one of the most important agricultural industries. The value of the vegetables other than potatoes and sweet potatoes in 1909 was $1,965,635, and the acreage devoted to this was 16,250. The raising of flowers and plants and nursery products is also relatively important. To these, 1330 acres were devoted in 1909, and the output was valued at $1,308,937. The orchard fruits produced in 1909 were 1,874,000 bushels, valued at $1,327,000. Apples contributed more than four-fifths of this quantity, and peaches, nectarines, and pears most of the remainder. Small fruits in 1910 were valued at $316,752. Of these, strawberries were by far the most important.

The total value of live stock on the farms, including domestic animals, poultry, and bees, in 1910 was $14,164,000, of which domestic animals contributed $13,133,000. Cattle numbered 195,318, valued at $6,730,287; horses, 46,341, valued at $5,739,400; mules, 416, valued at $72,721; swine, 52,372, valued at $472,741; sheep, 22,418, valued at $112,349. Poultry of all sorts numbered 1,265,702, valued at $988,653. The number of dairy cows on the farms in 1910 was 122,853, and the amount of milk reported in that year was 45,750,000 gallons. Butter made on the farms was valued at $1,078,000.

Fisheries. The fisheries of the State are of

great commercial importance, ranking third among the New England States in the value of their product. The total value of fish in 1908 was $2,981,720. Of this product, oysters were the most valuable. Of these there were taken for market purposes 1,394,600 pounds, valued at $1,167,650, and for seeding purposes, 2,553,500 pounds, valued at $1,415,290. Next in order of value were menhaden, 28,636,000 pounds, valued at $93,350; lobsters, 661,300 pounds, valued at $84,280; cod, 820,300 pounds, valued at $26,720; flatfish and flounders, 707,100 pounds, valued at $21,260; and swordfish, 240,100 pounds, valued at $14,600. Among other fish taken in considerable quantities were alewives, mackerel, shad, weakfish, clams, and eels. There were 952 independent fishermen engaged in fishing in different parts of the State, and 1195 wage-earning fishermen were employed. The vessels engaged in fisheries numbered 237 and were valued at $795,364. The cash capital invested in the fisheries of the State was $572,290.

Manufactures. Connecticut is one of the most important of the manufacturing States. This prominence is due to several causes, the chief of which are the early establishment of a number of important industries in the State and the unusually large amount of capital available for investment in manufacturing industries. Additional causes are the comparatively abundant water power and its geographic location near New York City, with which many of the manufacturing centres of the State have direct water-transportation facilities. Bridgeport, New Haven, and New London are seaports of considerable prominence and afford ample opportunities for domestic coastwise commerce. In addition, the main line of the most important railroad system in New England, the New York, New Haven, and Hartford, crosses Connecticut and gives direct and adequate connection with all parts of the country. The growth and concentration of the population of the State have been closely related to the increase in the importance of its manufacturing industries. In 1849 an average of 50,731 wage earners, representing 13.7 per cent of the total population, were employed in manufactures, while in 1909 an average of 210,792 wage earners, or 18.9 per cent of the total population, were so engaged. In 1849 the total value of the manufactures of the State, including the products of the neighborhood and hand industries, amounted to $47,115,000, while in 1909, exclusive of the value of the products of the neighborhood and hand industries, it reached $490,272,000. These figures represent increases of 315.5 per cent in the number of wage earners, and 940.6 per cent in the value of products. During this period the gross value of the products per capita of the total population of the State increased from $127 to $440. In spite of this fact the State's proportion of the total value of products manufactured in the United States fell from 4.6 per cent in 1849 to 2.8 per cent in 1899 and 2.4 per cent in 1909.

The rank of Connecticut among the States in regard to the value of its manufactured products was twelfth in 1909, as compared with eleventh in 1899, and fifth in 1849. The most important data in relation to the manufactures of the State in 1909 in comparison with 1904 will be found in the table below. In this table, because of lack of space, only industries the value of whose products exceeded $2,000,000 in 1909 are included.

From this table it will be noted that in Connecticut in 1909 there were 4251 manufacturing establishments which gave employment to an average of 233,871 persons during the year and paid out $135,756,000 in salaries and wages. Of the total number of persons employed, 210,792 were wage earners. The value of the products, turned out by these establishments was $490,272,000, to produce which materials costing $257,259,000 were used. The value added by manufacture was thus $233,013,000, which represents the net wealth created by manufacturing operations during the year.

In general this table brings out the fact that the manufacturing industries of the State as a whole showed greater development during the more recent five-year period (1904–09) than during the preceding five-year period (1899–1904), although a marked increase is shown for both periods in all items except in the number of establishments from 1899 to 1904. During the later period the number of establishments increased 22.3 per cent, the average number of wage earners 16.1 per cent, the value of products 32.8 per cent, and the value added by manufacture 31.1 per cent.

Although a few industries predominate in importance, there is, on the whole, a wide diversity in manufacturing activities. The leading individual industries, measured by value of products, are those connected with brass and iron manufactures. They include the making of rolled brass and copper, which composed the major portion of the product, and of brass ware, in the manufacture of which Connecticut is particularly prominent. The State ranks first in the combined value of brass and bronze products, reporting 44.6 per cent of the total for the United States. The leading manufacturing industry in the State, however, is connected with textile manufactures. These include cotton goods; silk and silk goods; woolen, worsted, and felt goods; and hosiery and knit goods. These four branches in 1909 gave employment to an average of 34,992 wage earners, or 16.2 per cent of the total for all manufacturing industries in the State. The value of the products amounted to $70,460,000, or 14.4 per cent of the total value of manufactured products. Of the total value of products for these branches of the textile industry, 34.4 per cent was contributed by the cotton mills, 29.9 by the silk mills, 27.5 by the woolen and worsted mills, and 8.2 per cent by the hosiery and knitting mills.

The industries relating to foundry and machine-shop products are of greater importance than is indicated by the statistics. Some machine shops manufacture a distinctive product and are assigned to other classifications. The most important product is hardware, of which more than two-fifths of the total value reported for the United States in 1909 is reported from Connecticut. Some of the largest establishments, other than those producing hardware, were engaged in the manufacture of textile and metal-working machinery and internal-combustion engines.

The manufacture of firearms and ammunition is one of the State's most important manufacturing industries. It is now mainly centralized in New Haven and Bridgeport. The increase in the value of products was much greater from 1899 to 1904 than from 1904 to 1909, being 57.2 per cent and 12.3 per cent respectively for the two five-year periods. Connecticut is the lead-

COMPARATIVE SUMMARY FOR 1909 AND 1904

ALL INDUSTRIES COMBINED AND SELECTED INDUSTRIES

INDUSTRY	Census	Number of establishments	PERSONS ENGAGED IN INDUSTRY				Primary horse power	Capital	Salaries	Wages	Cost of materials	Value of products	Value added by manufacture

ing State in the total value of the products of these industries. In 1909 the combined products of industries related to silverware formed over one-third of the total value for the country. Plated ware comprises the principal part of this industry. In 1904 and 1909 over two-thirds of the total value of plated ware in the United States was reported from Connecticut. Other manufacturing industries of great importance are those connected with the manufacture of corsets, automobiles, cutlery and tools, hats and fur-felt; electrical machinery, apparatus, and supplies; lumber and timber products; and clocks and watches, including cases and materials. In the last-named industry the State ranked first in the total value of products in 1909. Nine of the 16 establishments in the State were engaged primarily in the manufacture of clocks. This branch of the industry in Connecticut dates from early in 1800. Much of its early development took place in that State, where it has been largely centralized. The automobile industry showed greater rates of increase from 1904 to 1909 in value of products and in value added by manufacture than any other of the important industries of the State. Increases were also shown in the manufacture of silverware and plated ware, corsets, electrical machinery, apparatus and supplies, typewriters and typewriter supplies, and paint and varnish.

As is shown by the preceding table, the average number of persons engaged in manufactures during 1909 was 233,871, of whom 210,792 were wage earners. Wage earners included 157,659 males and 53,133 females. The wage earners under 16 years of age numbered 5421, of whom 2935 were male and 2486 female. The largest number of persons were engaged in manufactures relating to foundry and machine-shop products, 42,101; in the manufacture of brass and bronze products there were engaged 17,890; in the manufacture of cotton goods, 14,887; in the manufacture of silk and silk goods, 9385; and in the manufacture of firearms and ammunition, 9205. For the great majority of wage earners employed in the manufacturing industry in the State, the prevailing hours of labor ranged from 54 to 60 hours a week, only 8.4 per cent of the total number being employed in establishments where the prevailing hours are less than 54 a week, and but 1.4 per cent in establishments where more than 60 hours a week prevail.

In 1909, 68.2 per cent of the total value of products was reported from cities and boroughs having over 10,000 inhabitants, and 65.7 per cent of the average number of wage earners were employed in these places. The figures indicate that not only has a considerable change taken place during the last decade in the relative importance of the manufacturing industries of the different groups of cities and boroughs having over 10,000 inhabitants, but the combined industries of such places have gained considerably on those of the districts outside. The most important manufacturing city in the State is Bridgeport, in which in 1909 were 25,775 wage earners and a product valued at $65,608,806. In New Haven there were 23.547 wage earners and a product valued at $51,071,397; in Waterbury, 20,170 wage earners and a product valued at $50,349,816; in Hartford, 14,627 wage earners and a product valued at $40,667,598; in New Britain, 13,513 wage earners and a product valued at $22,021,241. Other cities in which the value of the manufactured products exceeded $10,000,000 in 1909 were Ansonia, Meriden, Torrington, Naugatuck, and Danbury. Every city and borough for which figures are available, except New London, shows an increase in the value of products in the decade 1899 to 1909. New London shows a decrease of 4.8 per cent from 1904 to 1909, due to the decline in shipbuilding. Bridgeport shows an increase in 1909, as compared with 1904, of 47.1 per cent in value of products and 32.2 per cent in the average number of wage earners. The gain in value of products was due largely to the increases in the output of automobiles, corsets, electrical machinery, foundry and machine-shop products, and gold and silver reducing and refining. New Haven shows an increase of 28.8 per cent in the value of products in 1904 to 1909, Waterbury 55.6 per cent, and Hartford 56.6 per cent.

Of the 4251 manufacturing establishments in 1909, only 93, or 2.2 per cent, had a value of product exceeding $1,000,000. These establishments, however, employed an average of 95,373 wage earners, or 45.2 per cent of the total number in all establishments, and reported 49.3 per cent of the total value of products and 44.7 per cent of the total value added by manufacture. Of the 93 establishments whose products in 1909 exceeded $1,000,000 in value, 13 were engaged in the manufacture of brass and bronze products, 4 in the manufacture of cotton goods, 3 in the manufacture of cutlery and edged tools, 14 in the manufacture of foundry and machine-shop products, 6 in the manufacture of silk goods, and 5 in the manufacture of silverware and plated ware.

Education. Connecticut has always been among the most progressive of the States in educational matters. Primary education was provided for at public expense from the earliest Colonial period, and the establishment of Yale University in 1701 afforded opportunities for higher education. The percentage of illiteracy in the State is low. In 1910, of the total population of 10 years or over of 901,026, 53,665 were illiterate, or 6 per cent. The illiterates in 1900 numbered 40,972, or 5.9 per cent. The increase in the decade in both number and percentage was due to the influx of foreign-born whites. In 1910 only 1707 persons of native parentage were illiterate, while the foreign-born white persons numbered 49,202 illiterate. The percentage of illiteracy among foreign-born whites was 15.4, compared with 16.3 in 1900.

The total school population according to the thirteenth census was, in 1910, 298,454. Of these 192,497 attended schools, or a percentage of 64.5 of all persons of school age. The report of the State Superintendent of Education for the school year 1911–12 shows a school population in 1911 of 255,692, and the number of scholars registered during 1911–12 was 197,852, which was greater than the number at the end of the previous year and much larger than the number at the end of the preceding year. Of the total number of children of school age, about 30,000 were from 4 to 7 years old, and were therefore not influenced by the compulsory-attendance law. The average number of days on which each child attended school was 160. The total number enrolled in the high schools of the State in 1911–12 was 15,322. The approved high schools numbered 55. The total number of teachers in 1911–12 was 5491, of whom 361 were men and 5130 women. The average wages per month for

women teachers was $57.87, and for men teachers $125.01. The estimated value of school property in 1913 was $20,982,007. The total expenditure for schools in 1912 was $6,122,367, or a cost of $34.98 for each child in attendance, and an expenditure per child of school age of $21.30, an advance of $6.50 in 10 years. Rural schools are under the supervision of trained men, in accordance with the supervision law passed in 1903. This law made possible the payment by the State of three-fourths of the salary of the supervisor in towns having less than 11 teachers, and one-half the salary in districts formed by the union of two or more towns having in all from 25 to 50 teachers. Decided beneficial results have followed this supervision of rural schools. Experimental trade schools were established in 1909. One of these is at New Britain and another at Bridgeport. These schools include departments of day school, continuation school, half-time school, evening school, vocational school, and special courses. There are normal schools at New Britain, Willimantic, New Haven, and Danbury. The Legislature of 1913 authorized the boards of education or school committees of any town or city to establish vocational guidance as a part of the educational system of these towns and cities. The same Legislature authorized the establishment and maintenance of schools with instruction in trades, useful occupations, and avocations in towns and cities.

There is no State university. The institutions for higher education are Trinity College (Protestant Episcopal), Hartford; Wesleyan University (nonsectarian), Middletown; and Yale University (nonsectarian), New Haven. The Connecticut College for Women (q.v.) at New London was founded in 1911. There is also a State agricultural college at Storrs. This is coeducational. There are schools of science, law, art, and medicine at Yale University. The Congregationalists have divinity schools at New Haven and Hartford, and the Protestant Episcopalians one at Middletown.

Militia. The organized militia of the State consists of two regiments and a separate company (colored) of infantry, two troops of cavalry, a battery of field artillery, a company of signal troops, and two companies of coast artillery corps, an ambulance company, and a field hospital. The total strength in 1913 was 2457 enlisted men and 184 officers. The official designation is the Connecticut National Guard.

Population. The population of the State from its early settlement to the present time is shown by the following figures: In 1637, 1800; in 1688, 17,000; in 1755, 133,000—3500 slaves; in 1787, 202,000; in 1800, 251,002; in 1840, 309,978; in 1860, 460,147; in 1890, 746,258; in 1900, 908,420; in 1910, 1,114,756. The estimated population on July 1, 1914, was 1,202,688; 1920, 1,380,631. The increase in the decade 1900–10 was 206,336, or 22.7 per cent. The increase in the previous decade (1890–1900) was 21.7 per cent. The population per square mile in 1910 was 231.3 compared with 188.5 in 1900 and 154.8 in 1890. That a very large proportion of the population of the State is urban is shown by the fact that, in 1910, 999,839 persons lived in places of 2500 or more inhabitants, while only 114,917 were classed as rural. The urban population increased 25.9 per cent in the decade 1900–10, while the rural population gained only 0.8. The percentage of the population in places of 2500 or more in 1910 was 89.7 per cent. The native white population of native parentage in 1910 was 395,649. Native whites of foreign or mixed parentage numbered 374,489. Foreign-born whites numbered 328,759, compared with 237,396 in 1900. The percentage of native whites of native parentage of the whole population in 1910 was 35.5, compared with 41 per cent in 1900. The percentage of foreign-born whites in 1910 was 29.5 per cent, compared with 26.1 in 1900. The negro population in 1910 numbered 15,174, compared with 15,226 in 1900. Of the foreign-born white population, 58,457 were born in Ireland, 56,953 in Italy, 54,120 in Russia, 34,126 in Germany, 23,642 in Austria, and 22,422 in England. Of the total population of the State, in 1910, 563,642 were male and 551,114 were female. The total number of males of voting age was 347,692, compared with 280,340 in 1900. The largest cities in the State with their populations in 1910 and 1900 are as follows: New Haven, 1910, 133,605; 1900, 108,027—Bridgeport, 1910, 102,054; 1900, 70,996—Hartford, 1910, 98,915; 1900, 79,850—Waterbury, 1910, 73,141; 1900, 45,859—New Britain, 1910, 43,916; 1900, 25,998—Meriden, 1910, 27,265; 1900, 24,296—Stamford, 1910, 25,138; 1900, 15,997—Norwich, 1910, 20,367; 1900, 17,251. Nearly all these cities show an unusually large percentage of gain in the decade 1900–10.

Transportation. The transportation facilities of the State have to a large extent aided its development in manufactures. Bridgeport, New Haven, and New London are seaports of considerable prominence and afford ample opportunities for domestic coastwise commerce. Other ports of entry are Fairfield and Stonington. From several of these cities there are lines directly in connection with New York City. The railroad system of the State reached an early development and has in recent years been little extended. The main line of the most important railroad system in New England, the New York, New Haven, and Hartford, traverses the State and gives direct connection to all parts of the country. This corporation also controlled nearly all the electric railways, of which construction in recent years has been large until the order of dissolution issued from the Federal Department of Justice in 1914. The total length of the New York, New Haven, and Hartford Company's lines within the State, including tracks of all kinds, was, at the beginning of 1914, 1885 miles. The only other railroads of importance whose lines are within the State's borders are the Central New England Railway Company, with a mileage of 98, and the Central Vermont Railway Company, with a mileage of 80. The South Manchester Railway is a small line having about three miles of trackage. In January, 1912, there were eight companies operating electric railways in the State, and the miles of single track were 996. There is, in general, a good system of roads, in the care of which communities are assisted by the State. The Connecticut River is an important highway of commerce and transportation, and improvements in the river below Hartford have been carried on by the United States government in recent years. In 1911 the Federal government completed improvements in Bridgeport harbor, and in the same year a 12-foot channel in the harbor of New Haven was completed. In the latter harbor breakwaters were also built and a 12-foot anchorage basin.

The Public Utilities Commission has general charge of the regulation of railroad rates in the State.

Finance. The finances of the State have for several years been in an unsatisfactory condition. The expenditures have greatly exceeded the receipts and it has been necessary to resort to loans and bond issues. The total receipts for the fiscal year ending September 30, 1913, amounted to $7,192,045. In this is included a loan of $1,745,000, which was necessary to meet current expenses. The balance at the beginning of the fiscal year was $2,186,245. The expenditures for the period amounted to $9,062,857. The expenditures in excess of receipts amounted to $1,870,812. The balance in the treasury at the end of the fiscal year 1913 was $315,431. The bonded debt of the State amounted at the end of the fiscal year 1913 to $7,064,100, and the temporary loans as noted above to $1,745,000, making a total debt of $8,809,100. In 1906 the State had no debt, but a surplus of $265,270. This shows an increase for six years in the State's indebtedness of $8,759,138. In the latter part of 1913 the treasury issued $4,000,000 in 4% bonds in order to pay temporary loans and future expenditures. To some extent the condition results from delays in payments of taxes. There is no penalty for deferred payments and this delay has been injurious to the State. The chief sources of revenue are the taxation of railroads and insurance companies, savings banks, general taxes, and inheritance tax. From the last-named source there was received in 1913 $840,312. The chief expenditures are for education, public works, and the support of State institutions. The treasurer, comptroller, and tax commissioner of the State constitute a board of equalization of taxes.

Banks. On June 14, 1912, there were 78 national banks in the State. Their resources amounted to $127,596,241; deposits subject to check, $65,957,004; and savings deposits, $2,404,558. Of the seven State banks the resources amounted to $15,213,735; and deposits subject to check, $10,466,079. The savings banks numbered 85, with 595,360 depositors. In the number of depositors in the savings banks Connecticut is surpassed only by Massachusetts and New York, the resources amounting to $315,248,206 and the deposits to $280,311,885. In addition to these banks there were 37 loan and trust companies, with deposits subject to check amounting to $24,513,743, and savings deposits amounting to $8,815,816.

Charities and Corrections. The charitable and correctional institutions of the State are under the control of the State Board of Charities. The penal institutions include the Connecticut State Prison at Wethersfield and the various county jails. The reformatories include the Connecticut State Reformatory at Cheshire, the Connecticut School for Boys at Meriden, the Industrial School for Girls at Middletown, the House of the Good Shepherd at Hartford, and the Florence Crittenton Mission at New Haven. Provision for the insane is made by the Connecticut Hospital for the Insane at Middletown, the Norwich Hospital for the Insane at Norwich, and the Hartford Retreat at Hartford. There are in addition a number of private sanitariums for mental and nervous diseases. Other institutions are the Connecticut Colony for Epileptics at Mansfield, the School for Imbeciles at Lakeville, the American School for the Deaf at Hartford, and the Mystic Oral School at Mystic. There were 25 public hospitals in the various cities in the State and nine sanitariums for tuberculosis and special hospitals. Provision for disabled soldiers is made at Fitch's Home for Soldiers at Noroton and a Woman's Relief Corps Home at Cromwell. There are, besides these institutions mentioned, a large number of private homes for the aged, temporary homes for children, and private homes for the young. The Legislature of 1911 provided for the transfer from the State prison to the reformatory at Cheshire, subject to the approval of the directors of this institution, all male prisoners under 25, sentenced to less than five years' imprisonment. The same Legislature provided that a contract for convict labor may not be made for longer than four years. A prisoner in the State prison sentenced for an attempt to murder by assault or an attempt to poison may be paroled after two years. The expenditures of the State for delinquents, defectives, and dependents in 1912 were $1,381,707. The expenditures for lands, buildings, and equipment were $487,300, or a total expenditure of $1,869,007. The State Board of Charities is authorized to visit and inspect all institutions, public or private. It includes some of the functions of a prison commission and those of a lunacy commission, and may correct any abuses, providing that this is done in such a manner as not to conflict with any personal, corporate, or statutory rights. The members of the board receive no remuneration for their services, but their actual expenses are paid. The State has adopted the policy of placing in private families children committed to reformatory schools, as well as orphans.

Government. The constitution of the State was approved by the people in 1818. Thirty-five amendments had been adopted up to 1914. Amendments originate in the House of Representatives, and a proposed amendment must be continued to the next General Assembly and be published with the laws which may have been passed at the same session; and if two-thirds of each house at the next session of the Assembly shall approve the amendments proposed, they are transmitted to the town clerk in each town in the State. He shall present the amendment to the inhabitants for their consideration at a town meeting, and if a majority of the electors present at such meeting shall have approved the amendments, they are valid to all intents and purposes as a part of the constitution.

Executive.—The executive power in the State is vested in the Governor, who holds office for two years. The other executive officers are Lieutenant Governor, Secretary, Treasurer, and Comptroller. The salary of the Governor was increased in 1912 to $5000 a year and that of Lieutenant Governor to $1500.

Legislative.—The legislative power of the State is vested in two houses, the Senate and the House of Representatives. The official title of both houses is the General Assembly. The Senate is composed of not less than 24 and not more than 36 members, who are elected biennially on the Tuesday after the first Monday in November. The House of Representatives consists of electors residing in towns from which they are elected. Every town which contains a population of 5000 is entitled to send two representatives. The population of each town is determined by enumeration made under the au-

thority of the United States census next before the election of representatives is held. There are 35 senators and 258 representatives. Senators and representatives are elected for a two-year term, and receive for the regular session $300 each and mileage. Only mileage is allowed for extra sessions. Up to 1911 there was no limit to the duration of the session of the Legislature. In that year a constitutional amendment was adopted which provided for an adjournment *sine die* not later than the first Wednesday after the first Monday in June, following its organization.

Judiciary.—The judicial power of the State is vested in the supreme court of errors, a superior court, judges of the court of common pleas, district courts, police courts, and the judge of probate. Judges of the supreme court of errors and of the superior court are appointed by the General Assembly upon the nomination of the Governor. There are one chief justice of the supreme court of errors and four associate justices. The superior court consists of six judges. There are courts of common pleas for Hartford, New Haven, New London, Fairfield, and Litchfield counties, each with one judge, except in New Haven County, where there are judges respectively for the civil and criminal sides. There is a district court in Waterbury, and borough courts and justices of the peace in various towns and cities.

Suffrage and Elections.—Every male citizen of the United States who shall have attained the age of 21 years, and who shall have resided in the State for a term of one year next preceding, and in the town in which he may offer himself to be admitted to the privileges of an elector at least six months next preceding the time he may so offer himself, and shall sustain a good moral character, shall, on his taking such oath as may be prescribed by law, be an elector. Each person admitted to be an elector must be able to read in the English language any article of the constitution or any section of the statutes of the State before being admitted an elector.

The general election for Governor, Lieutenant Governor, Secretary, Treasurer, Comptroller, and members of the General Assembly, is held on the Tuesday after the first Monday in November, every two years. In 1905 a constitutional amendment was adopted providing for the use of voting machines and other mechanical devices for voting. In 1909 the Corrupt Practices Act and the Australian Ballot Law were amended. The Legislature of 1913 passed statutes making provision for the election of United States Senators in accordance with the seventeenth amendment to the Constitution.

Local Government.—Each town annually or biennially, as the electors may determine, selects such officers of local government as the laws may prescribe. Sheriffs are elected in the several counties every four years. There is no legislative provision for the commission form of government in towns and cities, but in 1911 the town of Bristol adopted a city charter which contained some features usually found in a commission form of government, including provisions for the initiative and referendum.

Miscellaneous Statutory Provisions.—No county, city, town, borough, or other municipality is permitted to subscribe to the capital stock of any railroad corporation, or to become a purchaser of the bonds, or to loan its credit directly or indirectly in aid of any such corporation. Real estate acquired by a married woman's services or conveyed to her for a consideration may be held for her own use. The husband is trustee of a wife's personal estate, which upon his death falls to her or her devisees, legatees, or heirs, as though she had never been married; and married women may convey by devise the same as single persons, except that a husband (if he have not abandoned her) must unite in conveying by deed. Divorce may be had for fraudulent contract, adultery, desertion, and neglect of duty for three years, habitual intemperance, cruelty, imprisonment for life, and for certain crimes; previous residence required. The sale of liquor is regulated by each town in accordance with local-option laws. The registration of voters is required in the State, and women are allowed to vote in elections for school officers. The legal rate of interest is 6 per cent. Judgments outlaw in 17 years; notes and accounts in six years. The eight-hour day is a maximum for mechanics in State institutions except in unavoidable emergencies. No minor under 16 and no woman of any age is permitted to be employed in a mercantile establishment, unless it is manufacturing or mechanical, more than 58 hours a week, except under certain conditions; and no child under 16 can be employed unless he has a certificate of elementary education. No child under 16 is permitted to run or adjust certain dangerous machinery. The Legislature of 1911 passed an elaborate measure forbidding blacklisting. Physicians are required to report to the State Commission of Labor cases of occupational diseases. In 1911 a measure was passed requiring the registration of airships and the licensing of aëronauts. This is probably the first State law dealing with aëronautics. The same Legislature passed an elaborate act providing for sanitation in tenements, boarding and lodging houses, and several other measures providing for the purity of milk and other food and regulating the sale of liquors and drugs. Tobacco must not be sold or given to minors under 16. Any combination to increase prices of necessities is punishable by a maximum fine of $1000 or by imprisonment or by both. The Legislature of 1913 created a State civil service commission to consist of three members appointed by the governor. This commission is required to classify all officers and places of employment in the State service which come under the provision of the Civil Service Act, which was passed at the same session. The same Legislature passed a measure providing for workmen's compensation in case of injury.

Religion. Connecticut was in its early days a refuge for the English Nonconformists. For a long time the Congregational church had almost the entire field to itself. The Unitarian movement made less progress in Connecticut than in other New England States. With the emigration to Western States of large numbers of the descendants of the original Colonial stock and the incoming of large numbers of foreigners —especially Irish and French-Canadian—a still greater religious change has taken place. In 1913 the Catholic population numbered 438,483; non-Catholic, 778,248.

History. In 1614 Adriaen Block, a native of Holland, discovered and explored the Connecticut River, but it was not till 1633 that the Dutch of New Amsterdam began a trading post at Suckiaug (Hartford). Two years earlier the

soil from Narragansett Bay to the Pacific Ocean was granted by the Earl of Warwick to Lord Saye and Sele, and others, but the transfer apparently had no legal basis. In 1633 traders from Plymouth visited the site of Windsor. Wethersfield in 1634, and Windsor and Hartford in the following year, were settled by emigrants from Massachusetts Bay. In 1635 the Saye and Sele patentees sent over John Winthrop, Jr., to act as Governor. He built a fort at Saybrook, preventing the Dutch from getting control of the Connecticut, and gave the settlers in the upper valley a conditional permission to remain. Desire for a more democratic government caused a new exodus from Massachusetts, and in 1636 Hartford, Windsor, and Wethersfield received their chief bodies of immigrants. In 1638–39 the three towns united in an independent commonwealth and adopted a thoroughly democratic constitution. The Massachusetts system of town government, transplanted to Connecticut, attained its fullest development in the three upper settlements, with which Springfield (Agawam) remained nominally associated till 1641. War with the Pequots, the most powerful of the Indian tribes, in 1637, led to their extermination, and the progress of colonization was never again hindered by the enmity of the natives. In 1638 New Haven was founded by a Puritan colony under the Rev. John Davenport, and from 1638 to 1640 Milford, Guilford, and Stamford on the mainland and Southold on Long Island were settled. Together with Branford these towns were united, between 1643 and 1651, into one "jurisdiction," known subsequently as the New Haven Colony, as opposed to the upper settlements, which constituted the Connecticut Colony. The laws of the Old Testament were made the rule for all courts. A somewhat similar code of laws in Connecticut gave rise in after years to the nickname "blue laws" (q.v.), although Connecticut, unlike New Haven, did not restrict the franchise and the holding of office to church members. In 1644 Connecticut bought the colony of Saybrook from Saye and Sele, and gradually (1644–62), by purchase and colonization, acquired the greater part of the present State and a considerable portion of Long Island. In 1657 John Winthrop, Jr., was chosen Governor of Connecticut, and by his skill in diplomacy procured, in 1662, a charter from Charles II granting absolute autonomy to that Colony. By this charter New Haven was incorporated with Connecticut, in spite of the most vehement opposition on the part of the former. New Haven, nevertheless, was forced to submit (1664). In October, 1687, Sir Edmund Andros came to Hartford and demanded the charter from the General Assembly, but it was carried away and secreted till 1689. (See CHARTER OAK.) From 1687 to 1689, however, the Colony was subject to the despotic rule of Andros. In 1708 the Congregational church system was established by the adoption of the Saybrook platform, and this was supplemented by the Act of 1742. Though other denominations were tolerated, church and state for a long time remained closely connected, and secular and religious affairs were under the control of the same authorities. In 1754 Connecticut bought from the Indians a large tract of land in the Wyoming valley in Pennsylvania and proceeded to settle it, but was compelled in 1782 to surrender it to Pennsylvania. In 1786 the Colony relinquished its charter rights to the territory west of its present limits and received in return the Western Reserve (q.v.). Emigration to the western lands, as well as to Vermont and New York, was active.

The passage of the Stamp Act was vigorously denounced by the General Assembly; in May, 1776, the Colony was declared released from its allegiance to England, and in October Connecticut was constituted an independent State. It contributed more than 30,000 men to the Revolutionary army, and its Governor, Jonathan Trumbull, was one of Washington's most trusted advisers. In 1777 the British burned Danbury and in 1779 pillaged New Haven. Forts Griswold and Trumbull, at New London, were taken on Sept. 6, 1781, by Benedict Arnold, and the town was destroyed. In the framing of the Federal Constitution Connecticut took a prominent part, and to its delegates was due the adoption of that feature of the Constitution which provides for State representation in the upper house of Congress and proportionate representation in the lower. Connecticut was always a stronghold of federalism; it strongly opposed the War of 1812, and its capitol was the meeting place of the celebrated Hartford Convention (q.v.). In 1818 a new constitution was framed, church and state were separated, and the franchise was widely extended. The General Assembly was divided into a Senate and a House of Representatives. The conservative and theocratic character of the government became greatly modified as the State developed from an agricultural region into a commercial and industrial centre. The shrewdness of the Connecticut trader and the preëminent ingenuity of the Connecticut mechanic raised the State to a high degree of prosperity. During the Civil War Connecticut gave to the Union cause nearly 60,000 troops and the services of her great War Governor, Buckingham. Progress was rapid after the war. In the matter of public instruction the State took one of the foremost places in the Union, if not the foremost, devoting the entire proceeds from the sale of its public lands to the support of the free schools. In the readjustment, however, of the balance of political power in conformity with changed political conditions, no like spirit of progress was shown, and in 1901 the necessity of electoral reform was discussed at length in the press of the State. Representation in the lower house being based on the old township divisions and not on population, it happened that great cities like New Haven and Bridgeport were dominated by rural communities with one-tenth their population. In many cases a state of things prevailed not far removed from conditions in England before the Reform Bill of 1832. The agitation resulted in the calling of a constitutional convention, which met in January, 1902, and drew up a scheme of redistribution which was submitted to the people on June 16. The measure provided for one representative from every town with a population of less than 2000, two representatives for towns between 20,000 and 50,000, three for towns between 50,000 and 100,000, and four for all cities over 100,000, with one additional for every 50,000 inhabitants above that number. The effect of the measure would have been to deprive some towns of one representative each and to assign these to the large towns. The plan, however, satisfied neither the conservatives nor the advocates of reform, and was voted down. In 1907 there was submitted to the people a con-

stitutional amendment providing for a revised constitution. This, in effect, was the old constitution with the amendments included in the body of the document instead of being added as an appendix. The only change was in the term for judge of probate, which was made four years. The amendment was defeated. In the presidential election of 1908 Taft received 112,815 votes; Bryan, 68,225. G. L. Lilley, Republican, was elected Governor. On October 6 of that year a new stone bridge between Hartford and East Hartford, costing $3,000,000 and said to be the finest structure of its kind in the world, was dedicated with appropriate ceremonies. Governor Lilley died April 2, 1909, and was succeeded by Lieutenant Governor Frank B. Weeks. On Jan. 20, 1910, Frank B. Brandegee was reëlected United States Senator. Simeon E. Baldwin, former Chief Justice of the State, was elected Governor. This was the first election of a Democratic governor in the State since 1893. In January, 1911, George P. McLean was elected United States Senator to succeed Morgan G. Bulkeley. The Democrats in 1912 renominated Governor Baldwin. The Republicans nominated Judge J. P. Studley, and the Progressives Henry Knox Smith, former United States Commissioner of Corporations. In the election of November 5, 1912, Wilson received 74,561 votes; Taft, 68,324; Roosevelt, 34,129; Debs, 10,056. For Governor, Baldwin received 78,274; Studley, 67,531; Smith, 31,020. The Democrats elected representatives in all five districts and all the State officers. In national elections Connecticut has been in general Federalist, Whig, and Republican; but it cast its vote for Monroe in 1820, for Van Buren in 1836, for Pierce in 1852, for Tilden in 1876, for Cleveland in 1884, 1888, and 1892, and for Wilson in 1912. The State has seven votes in the electoral college.

COLONIAL GOVERNORS

Connecticut Colony

CONNECTICUT COLLEGE FOR WOMEN. An institution for the higher education of women at New London, Conn., chartered on April 4, 1911. It owes its foundation to the wish and purpose of the people of Connecticut to provide within the State adequate facilities for the higher education of women. Its scope of instruction includes the humanities, sciences and arts, and it gives the degrees of A.B. and B.S. At a later date it is proposed to introduce graduate curricula leading to the A.M. degree. Instruction is given in music and in the fine and applied arts. The college campus comprises 340 acres in the northern limits of New London. The academic group of buildings is designed to be the centre of the general scheme of the building plan of the college. It will comprise the college hall, the library, convocation hall and chapel, museum, science buildings, and arts buildings. In convenient proximity to the central group will be ranged the residence group and the buildings needed in the athletic and social activities of the students. The architectural style for the buildings is in general the domestic Tudor, with the associated Collegiate Gothic for certain of the larger edifices. The college has received generous gifts of money, including a benefaction from Hon. Morton F. Plant, who provided for general maintenance by a gift of an endowment of $1,000,000 and for the housing of students by a building fund of $100,000, for the erection of the Plant and Blackstone dormitories. The trustees in June, 1913, authorized the erection of an initial group of five buildings adequate for the use of the college at the outset.

Construction on these buildings began in the spring of 1914. The official date for the opening of the college is September, 1915. The president is Fred H. Sykes, A.M.

CONNECTICUT LAKES. A chain of four lakes in Coos Co., N. H. (Map: New Hampshire, G 1). The "First," or Connecticut, Lake is 4 miles long, 2¾ miles wide, and 1618 feet above the sea. Four miles northeast is the "Second" Lake, 2¾ miles long, 1 mile wide, and 1882 feet above the sea. The "Third" Lake, about 7 miles farther north and ½ mile from the Canadian boundary, is 2028 feet above the sea, and has an area of about ¾ of a square mile. "Fourth" Lake, a mere pond, the last of the chain and the source of the Connecticut River (q.v.), is northwest of the "Third" Lake, near the Canadian boundary line, and 2551 feet above the sea. For some description of these lakes, consult Bacon, *The Connecticut River and the Valley of the Connecticut* (New York, 1906).

CONNECTICUT RIVER. A river of the United States, rising in the beautiful Connecticut lakes (q.v.), in northern New Hampshire, 2551 feet above sea level (Map: Connecticut, F 4). It flows southwest and south, forming the boundary between New Hampshire and Vermont, and enters Massachusetts near South Vernon, Vt. From this point it continues nearly due south across the State and enters Connecticut, where at Middletown it turns towards the southeast and, completing its course across the State, empties into Long Island Sound at Saybrook. The Connecticut River, the longest in New England, is 375 miles long and drains an area of about 11,083 square miles; in the lower part of its course (from Deep River) its width varies from 750 feet to half a mile, but generally does not exceed a quarter of a mile. Its mean discharge at Hartford is about 19,000 cubic feet per second. It is navigable to Hartford, 49.5 miles, for large steamers, and by means of the Windsor locks small boats may ascend to Holyoke. Fluctuations due to the tide are 3.4 feet at Saybrook, 1.8 feet at Middletown, and about 1.2 feet at Hartford. At Deep River (12 miles from the Sound) the water is distinctly brackish, but 2 miles farther up it is virtually fresh. Usually the river is closed by ice from about the middle of January to about the middle of March. The river falls rapidly at places and furnishes extensive water power. The principal falls and their heights are: Holyoke, 59 feet; Turner's, 41 feet; Bellows Falls, 54.5 feet; Olcott, 36 feet; and the Fifteen-Mile Falls. The principal tributaries from New Hampshire are the upper and lower Ammonoosuc and the Ashuelot; from Vermont, the Passumpsic, White, and West. In Massachusetts the chief tributaries from the east are the Chicopee and the Miller; from the west, the Deerfield and the Westfield. The only considerable affluent in Connecticut is the Farmington River, which rises in Massachusetts and empties into the main stream 6 miles above Hartford. The chief towns on its course are Wells River, Bellows Falls, Walpole, Brattleboro, Greenfield, Northampton, Holyoke, Chicopee, Springfield, Hartford, and Middletown. Consult Bacon, *The Connecticut River and the Valley of the Connecticut* (New York, 1906), and for a detailed description of the river below Hartford, the Report on the "Connecticut River up to Hartford," by the Engineering Corps of the United States War Department, in *House Document No. 1294*, 61st Congress, 3d session (1911).

CONNECTIVE TISSUE. The most widely distributed tissue of the body. Its function, in whatever modification it occurs, is to support and connect the tissues of the animal frame. It originates in the middle or mesoblastic layer of the embryo, and the differentiation which occurs and which distinguishes the different forms of connective tissue takes place mainly in the intercellular substance. Thus the intercellular substance may be soft and gelatinous, as in mucous connective tissue, or dense and firm, as in fascia and tendon, or hard, as in bone. The cells of connective tissue begin as small, round mesoblastic cells. Either directly from these cells or under their influence there is formed between the cells an intercellular substance, which, as stated, varies in character, and during the formation of which various changes take place in the cells themselves. Connective tissue has a relatively poor blood supply, is scantily furnished with nerves, but abounds in lymphatics.

The principal types of connective tissue are as follows: 1. White fibrous connective tissue. 2. Yellow elastic connective tissue. 3. Developmental forms of connective tissue, (*a*) mucous and (*b*) embryonal. 4. Cartilage. 5. Bone and dentine. 6. Adipose tissue or fat. 7. Neuroglia, the connective tissue of the nervous system. Of these forms of connective tissue, fat, cartilage, bone, and neuroglia (see NERVOUS SYSTEM) represent the more highly specialized types and will be found described in articles under their respective names. The remaining represent those forms of connective tissue to which the term usually refers. *White Fibrous Connective Tissue.*—This constitutes the subcutaneous connective tissue and intermuscular septa, where it is known as areolar tissue; it also forms the ligaments, tendons, and the framework of all the organs. Its cellular elements consist of fixed connective-tissue cells and the so-called wandering cells. The fixed cells are mainly irregular or fusiform in shape, with very little cell body. Much less numerous are the so-called plasma cells of Waldeyer and the granule cells. Some connective-tissue cells, such as many of those found in the choroid coat of the eye, are densely pigmented. The wandering connective-tissue cells are probably identical with the white blood corpuscles. (See BLOOD.) In the intercellular substance two kinds of fibres are found, white fibres and yellow elastic fibres. The former occur in broad wavy bundles composed of minute fibrils; the elastic fibres are narrow, glistening, apparently homogeneous bands which branch and anastomose. There is much variation in the relative number of cells and fibres, the softer tissues being more cellular, the more dense tissues, such as tendon, being almost entirely composed of fibres. *Yellow Elastic Tissue.*—This may occur almost pure in some parts of the body, as in the *ligamentum nuchæ*. (See NECK.) In such tissue, instead of the fine delicate fibres described above, the fibres are large and coarse. *The Developmental Forms of Connective Tissue.*—The mucous tissue constitutes the Wharton's jelly of the umbilical cord, the embryonal connective tissue found in fœtal life. In mucous tissue the cells are stellate, with long branching processes which anastomose with those of other cells. The intercellular substance

is gelatinous, with only a few fibres. In the adult an example of mucoid connective tissue is seen in the vitreous humor of the eye. Here the cells have disappeared, and only the jelly remains.

CON'NELLEY, WILLIAM ELSEY (1855–). An American author, born in Johnson Co., Ky. He became the director of the Kansas State Historical Society and published several works on the early history of Kansas, Indian traditions, and folklore. Among these are: *Wyandot Folk-Lore* (1899); *Kansas Territorial Governors* (1900); *John Brown—the Story of the Last of the Puritans* (1900); *Doniphan's Expedition* (1907); *Quantrill and the Border Wars* (1909); *The Ingalls of Kansas* (1909); *Eastern Kentucky Papers* (1910); *Life of Preston B. Plumb* (1913). He was greatly assisted in his researches by his knowledge of the Indian languages, as exemplified in his publication of a vocabulary of the Wyandot tongue.

CON'NELLSVILLE. A city in Fayette Co., Pa., 57 miles southeast of Pittsburgh, on the Baltimore and Ohio, the Pennsylvania, the Western Maryland, and the Pittsburgh and Lake Erie railroads, and on the Youghiogheny River (Map: Pennsylvania, B 8). It has a park, fine municipal and public library (Carnegie) buildings, and is the seat of a State hospital (miners). The city is the centre of the Connellsville coke region, the most important seat of coke production in the United States. Until 1903 the coke output of this region was from 40 to 50 per cent of the total output of the United States. The estimated output in 1912 was 20,000,837 short tons. The city contains also machine and car shops, and glass works, steam-pump factory, railroad repair shops, etc. Settled in 1770, Connellsville was erected into a township and named (in honor of Zachariah Connell, the founder) in 1793 and was incorporated as a borough in 1806. It is governed by a mayor, who holds office for three years, and a common council. Connellsville contains the grave of Edward Braddock, the Irish general with whom Washington fought in the French and Indian Wars. Pop., 1890, 5629; 1900, 7160; 1910, 12,845; 1920, 13,804.

CONNEMARA, kŏn'nĕ-mä'rȧ (Ir. *Conmacne-mara*, seaside of the descendants of Conmac, the second of the three sons of Maeve, the English Mab, reputed Queen of Connaught in the first century A.D.). A district, 30 miles long by 15 to 20 broad, in the west of Galway, Ireland, between the bays of Kilkieran and Ballinakill. The name is often applied to the whole western part of County Galway (Map: Ireland, B 3). It has most fertile territory, though the coast is rocky, with abundant fishing, but the land has never been developed. Building stone and a green variety of marble, well adapted for decorative work, are extensively quarried. Peaks of mountains attain 2700 feet and are known to contain rich ore deposits.

CON'NER, DAVID (1792–1856). A United States naval officer, born in Pennsylvania. He entered the United States navy as a midshipman in 1809 and during the War of 1812 served as lieutenant on the *Hornet* in her engagements with the *Peacock* and the *Penguin*. He became commodore of the West India and home squadron in 1843 and, at the outbreak of the Mexican War, blockaded the Gulf ports. In his flagship, the *Raritan*, he led the attack on Vera Cruz in 1847 (*see* VERA CRUZ, CAPTURE OF) and landed General Scott's army of invasion. Commodore Conner was the first United States naval officer to use steamships in warfare. He was commandant of the Philadelphia Navy Yard at the time of his death.

CONNERSVILLE. A city and the county seat of Fayette Co., Ind., 57 miles east of South Indianapolis, on the Cincinnati, Hamilton, and Dayton, the Cleveland, Cincinnati, Chicago, and St. Louis, and the Fort Wayne, Cincinnati, and Louisville railroads, and on the White Water River (Map: Indiana, D 3). Among its features are a Carnegie library, a high-school building, Roberts Park, and Fayette Sanitarium. Connersville manufactures automobiles, pianos, paper, gloves, brick, blowers, carriages, mirrors, furniture, triple signs, overalls, and flour. The water works are the property of the city. Connersville was incorporated in 1813 and is governed by a mayor, elected biennially, and a council. Pop., 1900, 6836; 1910, 7738.

CONNOISSEUR, kŏn'nĭs-sĕr' *or* -sōōr' (Fr., one who knows). A person who, without being an artist, is sufficiently acquainted with any fine art to pass competent judgment upon it. The Italians call such persons *cognoscenti*. See DILETTANTE.

CONNOISSEUR, THE. A weekly publication conducted by George Colman the Elder and Bonnel Thornton from the early part of 1754 to 1756. In it the first published work of William Cowper appeared, entitled *Keeping a Secret*.

CON'NOLLY, JAMES BRENDAN. An American author, born in South Boston, Mass. From 1890 to 1895 he acted as clerk and surveyor with the United States Engineering Corps at Savannah, Ga. He took an active interest in athletics and in 1896 won the first Olympian championship of modern times. In the Spanish-American War he served with the Ninth Massachusetts Infantry, and in 1907–08 he served in the United States navy. His writings, dealing chiefly with the sea, include: *Jeb Hutton* (1892); *Out of Gloucester* (1902); *The Seiners* (1904); *The Deep Sea's Toll* (1905); *The Crested Seas* (1907); *An Olympic Victor* (1908); *Open Water* (1910); *Wide Courses* (1912); *Sonnie-Boy's People and Other Stories* (1913).

CONNOR, RALPH. The pen name of Rev. Charles W. Gordon (q.v.).

CON'NOR, SELDEN (1839–1917). An American soldier. He was born in Fairfield, Me., and in 1859 graduated at Tufts College. At the beginning of the Civil War he enlisted in the First Vermont Volunteers, but later joined the Nineteenth Maine Volunteers, of which he became colonel, and was severely wounded in the battle of the Wilderness. In 1864 he was commissioned brigadier general of volunteers, but in 1866 was mustered out of service. He was Governor of Maine in 1876–78. Subsequently he was United States pension agent (1882–86), in 1890 became president of the Society of the Army of the Potomac, in 1896–99 was senior vice commander in chief of the Order of the Loyal Legion, and in 1897 was again appointed pension agent. His address on *Hannibal Hamlin* was published in 1909.

CON'NOTA'TION (from Lat. *connotare*, to connote, from *com-*, together + *notare*, to note, from *nota*, mark, from *noscere*, to know; connected with Gk. γιγνώσκειν, *gignōskein*, Eng. *know*) OF A TERM. In logic, the quality or totality of qualities an object must possess in order to be appropriately designated by a given term. Thus, the connotation of the term "ani-

mal" consists of all those qualities (organized physical constitution, sensitiveness, etc.) which any object must possess if it is properly to be called an animal. In earlier logical theory, under the influence of Platonic realism, it was assumed that connotation was unvarying; but more recently it has been recognized that the connotation of a term varies from individual to individual and from time to time. Synonyms of connotation are intension, comprehension, depth. (See DENOTATION.) A *connotative term* is one which has a connotation and is said to *connote* the qualities by virtue of which objects have a right to be designated by the term and to *denote* the objects possessing these qualities.

CO'NODONTS (from Gk. *κῶνος, kōnos*, cone + *ὀδούς, odous*, tooth). Minute fossil teeth of uncertain affinities, found in rocks of Ordovician to Permian age of North America and Europe. They are very small, shining objects, with more or less extended bases, from which arise one or many slender, sharp, short, or long denticles. They thus vary in form from conical to pectinate according to the number and length of the denticles. The material of which they consist is red, brown, or white calcite or phosphate of lime. Associated with the toothlike forms are minute plates of the same material, that probably belonged to the same organisms. Conodonts were first described by Pander, in 1856, from the lowest fossiliferous (Cambrian) rocks of Russia and were by him regarded as fish teeth. Since then they have been found in England, the United States, and Canada, and various opinions have been expressed regarding their affinities. Newberry described a number from the Carboniferous shales of Ohio and compared them to the teeth of myxinoid fishes. Other authors have considered them to be the spines of crustacea or the lingual teeth of naked mollusks. These opinions are all less well supported by facts than is that of Zittel and Rohon, that conodonts are the teeth of annelids allied to the Nereidæ. In the same rocks with conodonts are often found jaws of annelids, described as *Prioniodus, Polygnathus*, etc. Consult: Pander, *Monographie der fossilen Fische des silurischen Systems* (St. Petersburg, 1856); Hinde, "On Conodonts from the Chazy and Cincinnati Groups," etc., in *Quarterly Journal Geological Society*, vol. xxxv (London, 1879); Newberry, *Paleontology of Ohio*, vol. ii (Columbus, Ohio, 1875); Zittel and Rohon, "Ueber Conodonten," in *Sitzungsberichte der königlich-bayerischen Akademie der Wissenchaften* (Munich, 1886). See WORM, FOSSIL; ANNULATA.

CO'NOID (Gk. *κωνοειδής, kōnoeidēs*, cone-shaped, from *κῶνος, kōnos*, cone + *εἶδος, eidos*, shape). A conoidal surface is a skew surface generated by the motion of a straight line which always meets a fixed straight line, is parallel to a fixed plane, and touches a given curve or obeys some other law. Commonly speaking, a conoid is a solid generated by the revolution of any conic section about one of its principal axes. For example, the earth is practically a particular form of conoid. Speaking more technically, the term is used to designate quadrics of revolution, as the surfaces of paraboloids, ellipsoids, and hyperboloids. Cones, cylinders, and conoids are special forms of ruled surfaces. Wallis (1663) effected the cubature of a conoid with horizontal directing plane, whose generatrix intersects a vertical directing straight line and vertical directing circle.

CON'OLLY, JOHN (1794–1866). An English alienist. He was born at Market-Rasen, Lincolnshire, and studied medicine at the University of Edinburgh. In 1839 he became director of the Middlesex Asylum at Hanwell. Immediately after his installation he abolished all the devices theretofore employed to confine and restrain the insane by means of strait-jackets, straps, and similar appliances. During the period in which he was connected with the institution (1839–51) he succeeded in completely revolutionizing the treatment of mental disease, and his so-called "no-restraint system" found rapid extension everywhere. Among his principal works may be mentioned: *Construction and Government of Lunatic Asylums* (1847); *The Treatment of the Insane without Mechanical Restraints* (1856); *Essay on Hamlet* (1863).

CO'NON (Lat., from Gk. *Κόνων, Konōn*). A distinguished Athenian commander. He first came into prominence in 413 B.C., when he was chosen admiral for the year. In 407 B.C. he was appointed one of 10 generals to succeed Alcibiades, but was defeated by Callicratidas at Mitylene. In 405 he was defeated by Lysander at Ægospotami, but succeeded in escaping with eight ships to Cyprus. In 394 he commanded the combined fleets of Persia and Athens which defeated the Spartans at Cnidus. By this victory he restored to the Athenians control of the sea. He afterward rebuilt the Long Walls of Athens and the fortifications of the Piræus. In 392 he was sent as envoy to the Persian Tiribazus, by whom he was thrown into prison and, according to some, put to death. According to the more probable account, he escaped, and died at the court of Evagoras in Cyprus.

CONON OF SAMOS. A Greek astronomer and mathematician, of the third century B.C. His work on Astronomy included a collection of the solar eclipses observed by the Chaldæans. His studies in conic sections formed the basis of book iv of the famous work on that subject by Apollonius of Perga (q.v.). He is best known, however, in connection with the cluster of stars known as the *Coma Berenices*. When Ptolemy III Euergetes was making war on Syria, his wife, Berenice, to insure his safe return, consecrated her hair in the temple of the deified Arsinoë, on the promontory of Zephyrium. When the hair was reported missing from the temple, Conon declared it had been placed among the stars: to prove his assertion he pointed out the constellation still known as *Coma Berenices*, which had not previously been distinguished. The story was treated by Callimachus, and by Catullus in his sixty-sixth poem.

CO'NOSCOPE (from Gk. *κῶνος, kōnos*, cone + *σκοπεῖν, skopein*, to view). A polariscope adapted to the study of crystals, having a revolving stage for regulating the position of the crystal section under examination, two Nicol's prisms (polarizer and analyzer) for production of double polarized light, a strongly convergent lens system below the stage to cause the light to enter the crystal in a cone of rays, and a similar system above the stage to correct the divergence of the rays, so that the eye may focus them for the retina. A conoscope is chiefly used to examine the so-called interference figures of crystals. The mineralogical or petrological microscope is constructed so as to be used either as a stauroscope or a conoscope. See POLARISCOPE.

CON'QUEROR, THE. A surname popularly

given to William, Duke of Normandy, on becoming King of England.

CONQUEST (from OF. *conqueste*, Fr. *conquête*, Sp., Portug., It. *conquista*, from ML. *conquista*, conquest, from Lat. *conquirere*, to procure, from *com-*, together + *quærere*, to seek). The forcible extension of sovereignty by one state over the territory of another as the result of successful war. Though it is denied, by advocates of natural justice, that this carries with it inherent rights of appropriation in territory, and destruction of national life, conquest has been one of the strongest agencies in molding civilization, and, in its influence upon the relationship of nations, it belongs to the realm of international law as well as to that of history.

Military conquest is developed from mere occupation of territory when the victorious state exercises continuously sovereign powers over the territory affected, and such conquest is deemed to be completed in the legal sense by the conqueror's signifying by some formal act his intention of adding it to his dominions, such as the publication of a diplomatic circular or a proclamation of annexation. The conditions justifying such acquisition and insuring immunity from interference by other states are: 1. A situation where, in order to redress a wrong or in self-protection, it becomes necessary to strip an aggressor of a portion of his territory. 2. The completion by treaty of the title which possession by conquest has given. 3. A general acquiescence in the act of the conqueror by neutral states. The changes in the map of Europe wrought by Napoleon's conquests and annexations were not accepted by the nations affected, and, by the Congress of Vienna, a return to the original conditions was made.

Title by conquest is, in principle, to be distinguished from title by cession, by the fact that, whether ratified by treaty or not, it rests avowedly on force, whereas the cession of territory is, in theory at least, always a voluntary act on the part of the ceding power. Thus, the acquisition of Porto Rico by the United States, as the result of the late war with Spain, was due to its conquest by the military and naval forces of the United States, while the acquisition of the Philippine Islands was disguised as a voluntary cession thereof by Spain. Indeed, it is usual for conquering nations in modern times to require as a condition of peace that the defeated nation shall recognize the title of the former to the conquered territory by a treaty of cession. The title is then, in legal theory, referred to the cession rather than to the act of conquest upon which it is really based.

Unless otherwise defined by treaty, the following rules govern the status of property and of the inhabitants of conquered territory: All public property passes to the conqueror absolutely. Except in the case of rebellion, private property rights remain undisturbed, and the conqueror is bound to make laws to insure the enjoyment of such rights, appropriate to the new political system imposed. Political laws and systems, being based upon reciprocal relations between citizens and the body politic, are destroyed, and, in the absence of treaty stipulations, political and civil rights of the inhabitants depend upon the provisions of the new régime. Absolute allegiance is due the conqueror. Municipal laws regulating the private relations of individuals are not abrogated, however, but continue in force by the implied acquiescence of the new sovereign, until superseded by new enactments. Consult Lawrence, *Principles of International Law* (London and New York, 1897), and also the authorities referred to under INTERNATIONAL LAW. See ALLEGIANCE; CESSION; CITIZEN; TITLE.

CONQUEST, IDA (1876–). An American actress, born in Boston. She made her début at the Tremont Theatre, Boston, in 1892, with Alexander Salvini, in a performance of *Rohan the Silent*. She is the daughter of a merchant of Boston, where she pursued her dramatic studies, and, when a child, played the part of Little Buttercup in *Pinafore* at the Boston Museum. She afterward appeared in *The Charity Ball* and *Americans Abroad*, under Daniel Frohman's management; *Liberty Hall* and *Under the Red Robe*, with the Empire Theatre Company, which she joined in 1895; *Too Much Johnson*, in which she played with the author, William Gillette, in London, and Gillette's *Because She Loved Him So*, produced in Boston in 1898. From 1901 to 1911 she appeared in many successful productions. Among the more notable are: *The Second in Command* (1901), *Ivan the Terrible* (1904), *Man and Superman* (1906), *Little Eyolf* (1910). Consult Strang, *Famous Actresses of the Day in America* (Boston, 1899).

CONQUEST OF GRANADA, grä-nä'dä, THE. 1. A tragedy by Dryden (1672), also called *Almanzor and Almahyde*. 2. A brilliant historical sketch by Washington Irving (1829).

CONQUEST OF MEXICO, THE. A noted historical work by W. H. Prescott (1843), containing the life of Hernando Cortés and an account of ancient Mexican civilization.

CONQUEST OF PERU, THE. An historical work by W. H. Prescott (1847), containing an account of the Incas and their civilization.

CONQUISTADORES, kôn-kês'tä-dō'râs (Sp., conquerors). A collective term for the Spanish conquerors of America, such as Cortés, Almagro, and Pizarro.

CON'RAD I (?–918). King of the Germans from 911 to 918. On the death of Louis the Child there was no Carolingian who had a legitimate claim to the throne in Germany. Consequently Conrad, who had some kinship with Arnulf, was elected. The sources for his election are few and conflicting, and consequently false statements about his origin have been readily accepted. Conrad favored and was supported by the Church, but could not command the obedience of the great dukes who were almost independent. He died Dec. 23, 918, and was buried at Fulda. On his deathbed he enjoined his brother to carry the royal insignia to his mortal enemy, Duke Henry of Saxony, with whom he had been continually at war since 912 A.D. Consult Stein, *Geschichte des Königs Konrad I* (Nördlingen, 1872), and Dümmler, *Geschichte des ostfränkischen Reiches*, vol. iii (Leipzig, 1888).

CONRAD II (c.990–1039). King of the Germans and Roman Emperor from 1024 to 1039, known as the Salic. He was the grandson of Otto, Duke of Carinthia, and was elected King of the Germans in 1024, after the extinction of the Saxon Imperial line, becoming the founder of the Franconian dynasty. Immediately after his election he commenced a tour through Germany for the purpose of administering justice. In 1026 he crossed the Alps, chastised the

rebellious Italians, was crowned at Milan as King of Italy, and in the following year was anointed Emperor of the Romans by the Pope. He was soon recalled to Germany by the outbreak of formidable revolts, which he succeeded in suppressing. In 1032–34 he secured the Kingdom of Burgundy and added it to the Empire. In 1036 a rebellion in Italy again compelled him to cross the Alps; but his efforts to restore his authority were this time partially unsuccessful, and he was forced to grant various privileges to his Italian subjects. Shortly after his return he died, at Utrecht, June 4, 1039. Conrad was one of the most remarkable of the earlier monarchs of Germany. He repressed the power of the great feudal nobles and, by keeping the great duchies in his own family, strengthened the position of the crown. Consult Bresslau, *Jahrbücher des deutschen Reiches unter Konrad II* (Leipzig, 1879–84), and Pflugk-Harttung, *Untersuchungen zur Geschichte Kaiser Konrads II* (Stuttgart, 1890).

CONRAD III (1093–1152). King of the Germans from 1138 to 1152. He was the son of Frederick of Swabia and the founder of the Hohenstaufen (q.v.) dynasty. Conrad, with his elder brother, Frederick, supported Henry V against his enemies, and in return that monarch granted Conrad, in 1115, the investiture of the Duchy of Franconia. He subsequently (1128–35) contested the crown of Italy with the Emperor Lothair of Saxony, but without success. On the death of Lothair the princes of Germany, fearing the increasing preponderance of the Guelph party and attracted by Conrad's brilliant courage and noble character, offered him the crown, and he was accordingly elected at Aix-la-Chapelle, March 7, 1138. He was immediately involved in a quarrel with Henry the Proud, Duke of Bavaria and Saxony, and this was the origin of the conflict that continued for centuries between the Welfs, or Guelphs, the partisans of Duke Henry, and the Waiblings, or Ghibellines, the supporters of the Franconian house. (See GUELPHS AND GHIBELLINES.) In 1146 St. Bernard of Clairvaux began to preach a new crusade, and in the fall of 1147 Conrad set out for Palestine at the head of a large army (see CRUSADE), in company with his old enemy, Welf of Bavaria. He died Feb. 15, 1152. Consult Bernhardi, *Jahrbücher des deutschen Reiches unter Konrad III* (2 vols., Leipzig, 1883), and Jastrow, *Deutsche Geschichte im Zeitalter der Hohenstaufen*, vol. i (Berlin, 1893).

CONRAD IV (1228–54). King of the Germans from 1250 to 1254. He was the son of Frederick II and was born at Andria, in Apulia, April 26, 1228. He was elected King of the Romans in 1237, but was never crowned. Frederick II died in 1250, and Conrad and William of Holland contended for the Imperial throne. Unable to make head against the increasing anarchy in Germany, Conrad retired to Italy in 1251, and succeeded in reëstablishing the power of the Hohenstaufen in Naples in the face of the hostility of the papacy. He died of fever, May 21, 1254. Consult: Schirrmacher, *Die letzten Hohenstaufen* (Göttingen, 1871); Jordan, *Les origines de la domination angevine en Italie* (Paris, 1909); Winkelmann, *Kaiser Friedrich II* (2 vols., Leipzig, 1889–97).

CONRAD, kōn'rät, JOHANNES (1839–). A German political economist. He was born in West Prussia and was educated at Berlin and Jena. He became professor of political economy at Jena (1870) and Halle (1872), and took a prominent part in the proceedings of the second commission appointed to revise the civil code of Germany. In 1878 he became editor of the *Jahrbücher für Nationalökonomie und Statistik*, and associate editor of the *Handwörterbuch der Staatswissenschaften* (1889–95; 2d ed., 1898 et seq.). His works include: *Das Universitätsstudium in Deutschland während der letzten fünfzig Jahre* (1884; Eng. trans. by Hutchison, with preface by James Bryce, 1885); *Grundriss zum Studium der politischen Oekonomie* (1896–1909); *Leitfaden zum Studium der Nationalökonomie* (1901).

CON'RAD, JOSEPH (1856–). An English novelist, the son of a Polish revolutionist. Known by his two first names, his real surname was Korzeniowski. He passed his youth in Poland. On the death of his father, Conrad, then only 13 years old, wandered to Marseilles, where he joined the French merchant navy and rose to be captain. Subsequently he became mate of an English ship. Though he did not learn English until comparatively late in life, he became the master of a style extraordinarily idiomatic and strong, and particularly notable for its descriptive resource. His successive books strengthened his reputation with exacting critics. Aside from their sheer narrative interest, his novels are vivid transcripts from seafaring life in the East, and skillfully note the changes effected in the Western character under Oriental influences. He has embodied his experiences in the Malay Archipelago and elsewhere in novels, fresh in subject and in style. They comprise: *Almayer's Folly* (1895); *An Outcast of the Islands* (1896); *The Nigger of the Narcissus*, published in the United States as *The Children of the Sea* (1897); *Tales of Unrest* (1898); *Lord Jim* (1900); *The Inheritors*, with F. M. Hueffer (1901); *Typhoon* (1902); *The Mirror of the Sea* (1906); *Point of Honor* (1908); *Chance* (1913); *'Twixt Land and Sea* (New York, 1913). Consult his volume of reminiscences, *A Personal Record* (1912), and R. Curle, *Joseph Conrad* (Garden City, 1914).

CONRAD, ROBERT TAYLOR (1810–58). An American judge and dramatist, born in Philadelphia, Pa. While a student he wrote *Conrad of Naples*. He wrote also for the press, and in 1832 began the *Daily Intelligencer*, which was soon merged in the Philadelphia *Gazette*. Failing health compelled his retirement from editorial work, and he became judge of the Court of Criminal Sessions, continuing until its dissolution, when he resumed his literary work and became editor of *Graham's Magazine* and associate editor of the *Philadelphia North American*. From this work he was called to be mayor of his city, and in 1856–57 was judge of the Court of Quarter Sessions. His *Aylmere, or the Bondman of Kent*, a drama, was played by Edwin Forrest. In 1852 this was published with other poems. He wrote also *Our Battles in Mexico* (1850).

CONRAD, TIMOTHY ABBOTT (1803–77). An American paleontologist, born in New Jersey. He was geologist in 1837 and paleontologist from 1838 to 1841 to the State of New York, and published a number of valuable works. His writings include: *American Marine Conchology* (1831); *Fossil Shells of the Tertiary Formations of the United States* (1832); *Monography of the Family Unionidæ of the United States*

(12 parts, 1835–59); *Check List of the Invertebrate Fossils of North America* (1866).

CONRÄDER, kôn'rä-dĕr, GEORG (1838–1911). A German historical painter. He was born in Munich, studied under Foltz and Piloty at the academy there, and first attracted attention by his "Tilly in the Grave-Digger's Dwelling"; "On the Eve of Breitenfeld" (Kunst Halle, Hamburg), a spirited composition, showing the influence of Piloty. Other important works of his are: "The Destruction of Carthage" (Maximilianeum, Munich), "Hauer Painting Charlotte Corday in Prison," "The Death of the Emperor Joseph II," and two other large ceremonial pictures, containing many portraits, in the National Museum at Budapest.

CONRADIN (kôn'rä-dēn') **OF SWABIA** (1252–68), King of Jerusalem and Sicily. The son of Conrad IV, and the last descendant of the Imperial house of Hohenstaufen (q.v.). At his father's death he was only two years old. Innocent IV immediately seized upon the young Prince's Italian possessions, on the plea that the son of a prince who died excommunicated had no hereditary rights; and other enemies of the house of Hohenstaufen were only too glad to follow the Pope's example. His uncle Manfred took up arms in his behalf, drove the papal forces from Naples and Sicily, and declared himself King till the young Prince came of age. This antagonism between the papacy and the Hohenstaufen induced Clement IV to offer the crown of the Two Sicilies to Charles of Anjou (q.v.). Charles immediately invaded Italy, and met his antagonists in the plain of Grandella, where the defeat and death of Manfred, in 1266, gave him undisturbed possession of the kingdom. The Neapolitans, however, detested their new master and sent deputies to Bavaria to invite Conradin, then in his fifteenth year, to come and assert his hereditary rights. Conradin accordingly made his appearance in Italy, and, being joined by the Neapolitans in large numbers, gained several victories over the French, but was finally defeated, and, together with his relative, Frederick of Baden, taken prisoner near Tagliacozzo, Aug. 23, 1268. The two unfortunate princes were executed in the market place of Naples, on October 29. His unfortunate fate and his poetical ability have made him prominent as a hero of drama. Consult Schirrmacher, *Die letzten Hohenstaufen* (Göttingen, 1871); Jordan, *Les origines de la domination angevine en Italie* (Paris, 1909); Hampe, *Geschichte Konradins von Hohenstaufen* (Innsbruck, 1894).

CONRART, kôn'rär', VALENTIN (1603–75). A French writer, born in Paris. A careful student of modern languages, he became an authority on matters of style. He gathered about him a weekly circle of littérateurs, who read and discussed original works. In 1635, under the auspices of Richelieu, this company was organized by royal letters patent as the French Academy, of which Conrart became perpetual secretary. He wrote little—a few poems, letters, and brief *Mémoires* (edited 1825 by Monmerqué), besides compiling copious extracts from contemporary writers, and published almost nothing. Hence the well-known verse from the *First Epistle* of Boileau: "J'imite de Conrart le silence prudent." Consult Kerviler and Barthélemy, *Conrart, sa vie et sa correspondance* (Paris, 1881).

CONRIED, kôn'rēd, HEINRICH (1855–1909). A theatrical manager. He was born in Bielitz (Austria), and received his education at the Realschule in Vienna. Beginning life as an actor, he soon undertook the management of various dramatic and operatic concerns. He came into prominence when he assumed the management of the Irving Place Theatre in New York. In 1903 he succeeded Maurice Grau (q.v.) as director of the Metropolitan Opera House. His first season was notable through the first production of *Parsifal* outside of Bayreuth, excepting an isolated production at Amsterdam in 1901. By Dec. 31, 1913, when the copyright of *Parsifal* expired, the work had been represented 43 times at the Metropolitan Opera House. For his advancement of art he was decorated by the emperors of Germany and Austria and the kings of Italy and Belgium.

CON'RING, HERMANN (1606–81). A German physician, jurist, and miscellaneous writer, born at Norden, East Friesland. He studied at Helmstedt and Leyden, in 1632 was appointed professor of natural philosophy at Helmstedt, and in 1636 professor of medicine. He subsequently held the chair of politics. In 1664 he was granted a pension by Louis XIV of France, and in 1669 was appointed by the King of Denmark a Councilor of State. He was a determined opponent of alchemy and contended for the pharmaceutical value of chemistry and for Harvey's theory of the circulation of the blood. His *De Origine Juris Germanici* (1643) was the pioneer work on the history of German law; and his *Exercitationes de Republica Imperii Germanici* (1674) was an important contribution to the literature of the civil law. A six-volume edition of his works was prepared by Göbel, with a biography (Brunswick, 1730). Consult Stobbe, *Hermann Conring, der Begründer der deutschen Rechtsgeschichte* (Berlin, 1870), and Goldschlag, *Beiträge zur politischen und publizistischen Tätigkeit H. Conrings* (Berlin, 1884).

CONSALVI, kôn-säl'vê, ERCOLE, MARCHESE (1757–1824). A papal diplomatist and reformer of abuses in the Papal States. He became chamberlain to Pope Pius VI in 1783, and auditor of the Rota Romana in 1792, in which office he displayed great administrative ability. As secretary of the conclave at Venice, in 1799, he contributed mainly to the election of Pius VII, who in 1800 made him a cardinal and Secretary of State. In this capacity he concluded with great diplomatic skill the concordat with Napoleon in 1801; but having afterward incurred the displeasure of the Emperor by his stout resistance to the encroachments of France on the rights of his sovereign, Napoleon demanded his removal from office in 1806. After the Emperor's downfall the Pope sent him as his representative first to London, to meet the allied princes assembled there; then to the Congress at Vienna, where by his tact and moderation he succeeded in securing the restoration of the Papal States, the government of which he assumed as Secretary of State, continuing in office until 1823. His clever management of the relations to the European Powers resulted in the conclusion of concordats with most of them under conditions most favorable to the papal authority, and he made his domestic policy memorable by beneficial reforms and the suppression of abuses in various branches of administration. The sciences, literature, and especially the fine arts, are much indebted to his liberal patronage. For his *Life*, consult Crétineau-Joly, ed. by Drochon (Paris, 1895).

CONSANGUINITY (Lat. *consanguinitas*, from *consanguineus*, having the same blood, from *com-*, together + *sanguis*, blood). The relationship which subsists between persons who are of the same blood, i.e., who are descended from a common ancestor. It is either direct, which is the relationship between ascendants and descendants, or collateral, between persons who have a common ancestor but are in a different line of descent; as cousins, who have the same grandparents on either their fathers' or mothers' sides, but who are the issue of different children of those grandparents.

For legal purposes different degrees of consanguinity are established. Thus, in the direct line, a child is in the first degree from its parents, a grandchild in the second degree, and so on. In the collateral line degrees are established beginning with brothers and sisters and extending to the most distant collateral relatives. The method of computing degrees varies in different jurisdictions according as they follow the civil or canon law in this particular. By the civil law the degrees are separately numbered downward to each party, the common ancestor not being counted. Thus by this rule brothers would be in the second degree, uncle and nephew in the third, and so on.

By the canon law, where the parties are equally removed from the common ancestor, consanguinity is computed by the number of degrees between them and the common ancestor, and by this rule brothers would be in the first degrees and others correspondingly one degree less than under the civil law.

The question of consanguinity is important, and sometimes controlling, in determining a person's legal rights, qualifications, or disabilities, especially as to entering into certain relations with another or acting in certain capacities. Thus the law prohibits marriage between certain relations; judges and jurors and other officers are sometimes disqualified from serving in their particular capacities because of relationship with persons who may come before, or deal with, them in public matters; and consanguinity within the prohibited degree is the gravamen of the crime of incest. It is the controlling factor in the laws of inheritance and descent, which, although they vary somewhat in different jurisdictions, are always based on relationship; and blood relatives always take in preference to collaterals. See AFFINITY; COLLATERAL; MARRIAGE; SUCCESSION; HEIR.

CON'SCIENCE (Lat. *conscientia*, from *conscire*, to be conscious, from *com-*, together + *scire*, to know). A term that has been used to name various factors in moral experience. Thus the recognition and acceptance of a principle of conduct as binding is called "conscience." Again, the judgment of approval or disapproval of individual acts as right or wrong has been called "conscience." Still again, the satisfaction that follows action regarded as right, and the dissatisfaction and remorse resulting from wrong conduct, have been called "conscience." In earlier ethical theories conscience was regarded as a faculty, having moral jurisdiction, either absolute or as a representative of God in man's soul. See ETHICS; CASUISTRY.

CONSCIENCE, COURTS OF. English courts for the recovery of small debts, constituted by special local acts of Parliament in London, Westminster, and other trading districts. These courts were also called *courts of requests*. The first of these, the Court of Conscience for London, was created in the ninth year of Henry VIII, but others were subsequently established and their jurisdiction and procedure minutely regulated by Parliament. They were freely resorted to for the small cases within their jurisdiction, which was originally limited to 40s., but afterward extended to £5. With the reorganization of the county courts in 1888 (the County Courts Act, 51 and 52 Vict., c. 43) the courts of conscience lost their importance and were, with a few exceptions, abolished. See COURT.

CONSCIENCE, kôn'syăns', HENDRIK (1812–83). A Belgian novelist of French extraction, distinguished for his pictures of Flemish village life. He was born in Antwerp, Dec. 3, 1812, and was largely self-educated. He entered the army in 1830, left it in 1836, and in 1837 published his first novel in Flemish, *In the Wonderful Year 1566*, which won him great success, but left him in debt to his printer. His patriotic courage, which led him to use Flemish as a medium for literary expression, won him the distinction of being known as the pioneer and first great classic author of the literature of Flanders. Patronage secured him a post in a government office. He wrote *Phantasy* (1837), a collection of fantastic tales, and *The Lion of Flanders* (1838). Finding office work irksome, he abandoned it for gardening, which in turn he gave up for a sinecure at the Royal Academy of Painting. In 1845 he was appointed associate professor in the University of Ghent and instructor in Flemish to the royal children. In 1868 he was made custodian of the Wiertz Museum. These posts and others were rewards for unflagging efforts to revive and stimulate a literary interest in Flemish. He died in Brussels, Sept. 10, 1883. Among other well-known works of Conscience, most of which are translated into French and German and a few into English, are: *How One Becomes a Painter* (1843); *The Poor Nobleman* (1851); *The Good Luck to be Rich* (1855); *Duke Karl's Justice* (1876); *Benjamin of Flanders* (1880). His historical novels, written under the influence of Walter Scott, do not compare with his other works that give a very delicate and clean-cut portrayal of Flemish family life. The publication of his one hundredth volume in 1881 was the occasion for a national celebration throughout the Kingdom of Belgium, so popular was he among his countrymen. For his biography, consult Eeckhoud (Brussels, 1881) and Pol de Mont (Haarlem, 1883).

CONSCIENCE WHIGS. A name applied to those members of the Whig party in Massachusetts who in 1850 and thereafter refused to coöperate with those of their old associates—the so-called "Cotton Whigs"—who declared that the slavery question had been permanently settled by the Compromise of 1850. In New York the two factions were known respectively as the "Woolly Heads," or "Seward Whigs," and the "Silver Grays," or "Snuff Takers."

CON'SCIOUS LOVERS, THE. A comedy by Sir Richard Steele (1722), modeled upon Terence's *Andria*. This play was an attempt by Steele to purify the stage, and is referred to in Fielding's *Joseph Andrews* as the only fit play for a Christian to see.

CON'SCIOUSNESS. A term employed by psychology in two principal meanings. 1. In the first meaning it is the equivalent of "mental

endowment," or "the possession of mind." I am conscious of the objects and persons about me, of my own successes or shortcomings, of the validity of an argument or the beauty of a work of art, in the sense that I am mentally alive to these things, am capable of a mental reaction upon them, whether by way of mere perception or by way of critical estimate and appreciation. So, if I am sound asleep, or in stupor from a blow on the head or from the action of some drug, I am said to be "unconscious"; my mental life and reactions are in abeyance. This meaning, which would perhaps have lapsed from psychological usage were it not deeply rooted in the phraseology of philosophy and in popular parlance, must be carefully distinguished from the second and more technical meaning, according to which (2) consciousness is simply "present mind," "mind now," the total mental experience given at a particular time. "Consciousness," says Wundt, "does not mean anything that exists apart from mental processes; nor does it refer merely to the sum of these processes, without reference to their mode of interrelation. It expresses the general synthesis of mental processes, within which the single complexes are marked off as more intimate connections." It is "a comprehensive interconnection of simultaneous and successive mental processes." We may therefore define it as a cross section or temporal division of mind (q.v.); mind consists of a series of consciousnesses, more or less sharply differentiated. As we begin the day, we have the waking consciousness, followed by the getting-up consciousness, the breakfast consciousness, the work consciousness, etc., etc.

The separate complexes which enter into and compose a consciousness are termed the "contents of consciousness." Thus, the consciousness of a writer, at his desk, contains various psychological ideas, mostly in verbal form; the perceptions of sight and touch that are aroused by the act of writing; a general feeling of effort, etc. The question of the "range of consciousness," i.e., of the number of mental processes that a single consciousness can contain, has been approached experimentally and partly answered. It is found, e.g., that if an auditory consciousness be set up, by subjecting an observer (whose mind is otherwise unoccupied) to a continued series of metronome strokes, its range lies between the limits of 8 double impressions (16 strokes, rhythmically grouped in twos) and 5 eightfold impressions (40 strokes, rhythmically grouped in eights). In other words, a practiced observer can distinguish, without counting, between two successive series of 40 and of 39 strokes, if he be allowed to group by eights; whereas he cannot, however he may group them, distinguish between series of 41 and 42 strokes; these numbers exceed the maximal range of consciousness. The phrase "state of consciousness," formerly applied to mental processes like ideas, emotions, etc., now designates the mode of existence (clearness, prominence, obscurity, inhibition) of the contents of a particular consciousness; it is fully explained under ATTENTION (q.v.). Other phrases in general use are "field of consciousness" and "stream of consciousness"—the one formed after the analogy of the phrase "field of vision," the other emphasizing the essentially transient nature of conscious contents. Consult: Wundt, *Physiologische Psychologie* (1910); Titchener, *Text-Book of Psychology* (New York, 1910); James, *Principles of Psychology* (ib., 1890); Della Valle, *La psicogenesi della coscienza* (Milan, 1905). See SELF-CONSCIOUSNESS; UNITY OF CONSCIOUSNESS; EPISTEMOLOGY; PSYCHOLOGY; NOETIC CONSCIOUSNESS.

In modern philosophy consciousness first received attention from Descartes, who regarded it as the differentiating attribute of mind, which he defined as thinking substance. Spinoza classed it as one of the attributes of the one substance, the other known attribute being extension. Leibnitz ascribed it only to the more advanced monads (q.v.), the perceptions of the lower monads being unconscious. Kant elevated consciousness to the highest place among the synthetic principles which organize experience, calling it "the synthetic unity of apperception." The followers of Kant, including most recent idealists, treat it as a peculiar property of the "subject," the subject being the higher of the two terms which according to them are always distinguishable in experience; the other term is the "object." These two terms in their interrelation constitute what is technically known as the "subject-object relation." In the revolt against idealism within the last 15 years many thinkers, of whom William James is the best known, have discarded this view, and have substituted what has come to be called "the relational view of consciousness." According to James "pure experience," i.e., experience which is unreflective, is devoid of consciousness. In such experience things are not known; they simply "*are there.*" But certain experiences appropriate prior experiences; and this appropriation constitutes the appropriated and the appropriating experiences into a "biographical continuum," i.e., into a self-conscious personality. This practically identifies consciousness with self-consciousness, and self-consciousness with memory. John Dewey agrees with James that in unreflecting experience there is no consciousness; for him consciousness (=awareness) is attention, and attention marks the interruption of the smoothly flowing experience by a problem: something goes wrong, and consciousness, or awareness, is the instrument which such an experience develops to rectify the trouble. There is no consciousness in naïve unsophisticated perception. A view with quite a number of supporters, more or less influenced by Dewey, is that consciousness is a mode of organic behavior, capable of being observed from the outside just as well as any other mode of organic behavior. This is sometimes called "behaviorism." So far as it differs from Dewey's view, it ascribes consciousness to percipient organisms as well as to organisms that are intelligent; but in either case the consciousness ascribed is the behavior observed. Still other thinkers, accepting the view that consciousness is a relation among objects, have attempted to identify this relation in other ways than those adopted by James, Dewey, and the behaviorists. Thus, for Woodbridge consciousness is the objective relation of meaning obtaining among things; for McGilvary it is the relation which makes an experience out of objects; for Perry it is "behavior and those elements of the environment selected by the behavior"; for Montague it is the potential energy of the brain; for Pitkin it is a relation of projection. The preceding account will show that one of the moot problems of present-day philosophy is the nature

of consciousness. Most of the literature is in periodical form. Consult: James, *Essays in Radical Empiricism* (New York, 1912); Perry, *Present Philosophical Tendencies* (ib., 1912); Marvin and others, *The New Realism* (ib., 1912), and articles in recent volumes of the *Journal of Philosophy, Psychology, and Scientific Methods* by Montague, Woodbridge, Perry, McGilvary, Singer, and others.

CONSCIOUSNESS, UNITY OF. See UNITY OF CONSCIOUSNESS.

CON'SCRIPT FATHERS. A name given to the Roman senators after the expulsion of the Tarquins, when Brutus added 100 to the number of senators, the names of the newcomers being "written together" (*conscripta*) on the rolls with those of the original councilors. The proper designation was then *Patres et Conscripti*, afterward abridged to *Patres Conscripti*.

CONSCRIPTION (Lat. *con-*, together + *scribere*, to write). A compulsory enrollment or registration of men for service in the army and navy. Originally the word related to the selection, by lot, of a portion only of the male population qualified for military service. Later the word was used, as at present, to describe compulsory military service, whether partial or universal. The methods of raising men for the army have varied, from time to time and in the different states, with the exigencies and emergencies arising, and with the characteristic political and economic ideals of the people concerned. Athens employed a compulsory citizen militia which resembled in its effect the modern European system of universal service. The young men served two or three years continuously and then passed to a class of reservists subject to call when needed. Sparta went even further. Her male citizens of military age were not only compelled to serve, but to train themselves continuously in peace for service in war, the whole nation, in fact, living as a military garrison. The Roman system depended on the annual levy, consisting of four legions of infantry, two for each consul, each legion containing 6666 men. The consuls, who in the time of the Republic were always commanders of the army, would announce by herald or written proclamation that a levy was to be made. The proper conscription was as follows: *Milites cogere, colligere, scribere, conscribere.* The Swedish armies, 1630–32, under Gustavus Adolphus, were in part composed of national regiments raised on the *Indelta* system, under which each officer and man in a territorial district received a grant of land, each district supplying recruits in proportion to its population. It was, however, to France that we owe the modern principle of universal compulsory service. One of the earliest and most serious problems of the French Revolution was the question of an adequate supply of recruits. A limited compulsory system, supplemented by volunteer enlistment, was found inadequate and was replaced in 1792 by universal conscription, under which every man was liable for active service. This plan, however, included the serious defect of granting to communes and districts the privilege of selecting the men to fill the quota. As might have been anticipated, this resulted in the selection of the most undesirable citizens of the community. The means of enforcing the law were wanting. Various schemes were tried. So long as Napoleon's victories lent encouragement, recruiting was partially successful. After 1796, however, the citizens began to grow tired of the hardships of war, and there developed an ever-increasing opposition to the severity of the conscription laws. The economists regarded military service as a waste of productive energy. In order to meet this situation adequately the now famous conscription law of Jourdan became, in 1798, the law of the country and remained practically unaltered until 1870. This law, the basis of all continental systems, definitely asserted the right of the government to require every qualified citizen to serve in the army from his twentieth to his twenty-fifth year, leaving it to the government to determine what number should be called to the colors each year. Unfortunately an otherwise effective law was weakened by the privilege of exemption from service provided there was deposited a certain sum of money sufficient to secure a substitute. This latter principle led directly to the regular and repeated employment of an undesirable class of men and was one of the underlying causes of the disasters of 1870–71. The Prussian defeat by Napoleon at Jena in 1806 resulted in the introduction by Prussia of the *Krümper* system (from *Krümperpferde*, worn-out, condemned horses attached to mounted organizations for odd jobs; applied to recruits in jest). The regiments became training schools, through which recruits were quickly passed to the reserve. A large permanent army was prohibited by the Treaty of Peace after Jena. The system required universal service with few exemptions. For the first time in modern history there existed, in preparation for war, a systematic compulsory training in time of peace. The Krümper system, modified and improved, has been and is a controlling influence in the economic as well as in the military development of continental Europe. Since 1870, with the exception of Great Britain and the United States, all the Great Powers have adopted the principle of *compulsory* short service, reserves, and certain legal exemptions, e.g., the only son of a widow, certain officials of the government, etc. In the Republic of Switzerland there is universal service, but, in marked contrast to all other continental countries, there is no standing or permanent army. All males of military age, 20 to 48, serve; but as militia only, reporting for a few weeks each year for training and then returning to their civil pursuits. The modern plan of conscription includes the following: The male population is divided into classes, by ages, the total period of liability to service being about 25 years. At any given time, assuming two years' service with the regiment, the men of 20 and 21 years of age constitute the *active* army; those of 22 and 23 form the *reserve* for that army. These two classes form the *First Line*. The *Second Line*, called the *Landwehr*, consists of all men from 24 to 36 who have passed through the active army. The *Third Line*, called the *Landsturm*, consists of men who have also been in the active army, but are now between the ages of 36 and 44. In this system the state does not offer pay as an inducement, the pay being nominal, but does assert the principle that every citizen owes a military duty to his government and that this obligation includes training in peace for service in war.

The people of the United States have always been opposed to any system of conscription, and yet in the only two wars which threatened the existence of the government, the American Revolution and the Civil War, conscription was re-

sorted to despite all opposition. As early as 1777 the germ of this idea of compulsory service was embodied in a resolution of the Continental Congress. With its ineffective supervision of the States furnishing the militia quotas for the Continental Army, commanded by General Washington, Congress found it impossible to keep the ranks full by voluntary enlistments, and therefore recommended to the States, in a resolution dated April 14, 1777, that exempted persons be *compelled* to furnish a certain number of soldiers and be *compelled* to pay the additional bounties, etc. This use of paid substitutes introduced into the ranks the lowest class of mercenaries. Before the end of the year 1777 Massachusetts and Virginia set the example of *drafting* (conscription), and General Washington commended the measure to the Pennsylvania authorities as the only sure method of raising continental troops. In the following year, and with reference to the substitution feature of the draft, General Washington wrote as follows to the President of the Massachusetts Council: "It gives me inexpressible concern to have repeated information from the best authorities that the committees of the different towns and districts in your State hire deserters from General Burgoyne's army and employ them as substitutes to excuse the personal service of the inhabitants. I need not enlarge upon the danger of substituting as soldiers men who have given a glaring proof of a treacherous disposition, and who are bound to us by no motives of attachment, instead of citizens in whom the ties of country, kindred, and sometimes property are so many securities for their fidelity." Thus General Washington soon learned that in any prolonged war demanding the ultimate resources of a state, volunteering is inadequate and the substitution feature of conscription inadvisable, if not disastrous. Brevet Major General Emory Upton, United States army, in his notable work *The Military Policy of the United States*, written in 1880 (Washington Government Printing Office, 1912), submits the results of his analysis of the American Revolution in the following words: "It may be laid down as an axiom, based upon historical proof, that any government which foregoes its rights to compulsory military service becomes more and more enslaved by depending solely upon voluntary military service induced by gifts of money, land, and clothing. . . . That neither voluntary enlistments based on patriotism, nor the bounty, can be relied upon to supply men for the army during a prolonged war. . . . That the draft, connected or not connected with voluntary enlistments and bounties, is the only sure reliance of a government in time of war." The history of the Civil War (1861–65) also proved conclusively that in any great military undertaking the government could not rely upon volunteers alone to supply the wastage of war. In the Union army conscription was provided for by the Act of Congress known as the Enrollment Act, approved March 3, 1863, under which the President of the United States was authorized to call into active service quotas from each of the States of the Union. This act contained a clause popularly known as "The Rich Man's Exemption," under which any person drafted and notified to appear might furnish an acceptable substitute to take his place in the draft, or might pay, in lieu thereof, a sum not to exceed $300 for the procuring of such substitute. A person failing to comply with these regulations was deemed a deserter and could be arrested as such. The execution of the draft law created opposition in many communities. In the city of New York the enforcement of this law culminated in the notorious *Draft Riots* during the month of July, 1863, resulting in great loss of life and destruction of property. The riots lasted four days, and order was not permanently restored until the city was placed under martial law, supported by several regiments ordered from the field into the city. As early as 1862 the government had realized the failure of the volunteer system and had concluded that conscription, no matter how unpopular, was the only surely effective method of obtaining recruits. Unfortunately the principle of substitution and bounties was authorized and resulted, as always, in discrimination against the poor man and the admission of undesirables. After the riots President Lincoln, under date of Aug. 7, 1863, wrote as follows to Governor Seymour of New York: "We are contending with an enemy who, as I understand, drives every able-bodied man he can reach into his ranks, very much as a butcher drives bullocks into a slaughter pen. No time is wasted, no argument is used. This produces an army which will turn upon our now victorious soldiers already in the field, if they shall not be sustained by recruits as they should be. It produces an army not to be matched on our side if we waste time to reëxperiment with the volunteer system, already deemed by Congress, and palpably, in fact, so far exhausted as to be inadequate." The Confederate States Congress at an earlier date than the government of the United States recognized the failure of the voluntary feature of enlistment by passing a conscription law, April 16, 1862, the first section of which was as follows: "The Congress of the Confederate States of America do enact, that the President be, and he is hereby, authorized to call out and place in the military service of the Confederate States, for three years, unless the war shall have sooner ended, all white men who are residents of the Confederate States, between the ages of 18 and 35 years at the time the call or calls may be made, who are not legally exempted from military service."

In England in 1902 an agitation for universal compulsory service was started by the organization of the National Service League, of which Lord Roberts was elected president. (On compulsory service in England, consult *Fallacies and Facts* by Lord Roberts, 1911; and Sir Ian Hamilton's *Compulsory Service*, 1910.)

The United States army has no compulsory enlistment feature for the regular army, reserves, or militia. Although the whole body of male citizens between the ages of 18 and 45 years are declared by law to be *the militia*, only a small number of such citizens, called the *organized militia*, receives any military training whatever. The enlistment of these is purely voluntary. Recent laws have attempted to give the Federal War Department a more effective control over the organized State militia, but that control in any case can be lawfully exercised only within the continental limits of the United States and ceases in all cases with the expiration of the enlistment period. Thus, the United States regular army cannot be followed and supported by a second line of trained men, in any expedition beyond the borders of the United States, unless the hasty organization of untrained

civilians into volunteer regiments may be considered such.

Considering the economic influence of universal compulsory service as practically illustrated in the case of Germany, the highest exponent of that system, we find that for 43 years, since 1871, thanks to her military efficiency, she has preserved the peace with her neighbors and thus gained the opportunity to develop her industries. The German, for two years, undergoes the most rigorous military training, learns the habit of obedience to constituted authority, practices daily the latest theories of sanitation, is schooled mentally and exercised physically, and is then returned to his civil pursuits equipped for the serious business of making a living. The government utilizes his services in many of its departments. The police force of Berlin, said to be the best in the world, is composed entirely of army men. The sergeants of this force have the educational qualifications of a high school or minor college graduate in the United States. It has been estimated that on the average the trained German soldier's expectation of life is five years better than the normal of his own class in civil life. The German business man of to-day regards the army as a peace guaranty for the further extension of his commercial ventures. It should be remembered that Germany freely elects her Legislature by popular vote; that the compulsory military system has been in operation for over a century; that although there is, as in all questions of policy, a minority opposition, there has not yet been a majority vote against the existing military system. Therefore it must be concluded that the German people have retained their military guaranty of peace because they thought it both necessary and desirable.

CONSCRIT DE 1813, kōn'skrē' de dēs wēt sĕn trâz, LE. An historical novel by Erckmann-Chatrian (1864).

CON'SECRA'TION (Lat. *consecratio*, from *consecrare*, to hallow, from *com-*, together + *sacrare*, to consecrate, from *sacer*, holy). The act of solemnly dedicating a person or thing to the service of God. It is one of the most widely spread of all religious ceremonies of the ancient world, having been practiced in Babylonia, Egypt, India, Judæa, Greece, Rome, Britain, and other countries. In the Old Testament we read of the consecration or dedication of the firstborn, both man and beast, to the Lord, also the dedication of the Levites, of the tabernacle and altar, of fields, houses, walls, etc. The custom of consecrating the places of public worship developed in the Christian Church as soon as persecution ceased, when, according to Eusebius, "the sight was afforded so eagerly desired and prayed for by all—the festivals of dedications and consecrations of the newly erected houses of prayer throughout the cities." Eusebius also describes the consecration of the church built at Jerusalem by Constantine in 335 A.D. The practice of consecrating religious edifices has continued in the Oriental, Roman, and Anglican churches. The forms, as found in the sacramentaries of Gelasius and St. Gregory, were at the first very simple, but they were gradually developed until, in the Roman Catholic church, the office of consecration became a long and impressive ceremony. It includes the placing in the altars of relics of the saints, the purification of the place with specially prepared holy water (called Gregorian Water because the formula for its benediction is first found in the sacramentary of St. Gregory), and the anointing of the church in 12 specified places with holy oil. (For the full form, consult the *Catholic Encyclopedia* under CONSECRATION.) The anniversary of this ceremony is kept as a festival of the first class. A church may not be consecrated until it is entirely free from debt; when the consecration is delayed, it is opened with a simple form of benediction. The ceremonies in the Eastern churches are as elaborate and not dissimilar. In the Church of England each bishop is left to his own discretion as to the form to be adopted, but that most generally used is the form sent down by the bishops to the Lower House of Convocation in 1712. The American prayer book provides a simple form of prayer, which retains the old ceremony of the bishop knocking for entrance at the door of the church. For the consecration of bishops, see BISHOP; ORDERS, HOLY; for that of the eucharistic elements, see MASS; LORD'S SUPPER.

CONSEC'UTIVES (Fr. *consécutif*, Sp., Portug., It. *consecutivo*, from Lat. *consequi*, to follow, from *com-*, together + *sequi*, Gk. ἕπεσθαι, *hepesthai*, Lith. *sekti*, Skt. *sac*, to follow, Goth. *saihwan*, Icel. *sjá*, AS. *sēon*, OHG. *sehan*, Ger. *sehen*, Eng. *see*). In music, the progressions of parallel fifths or octaves, which, according to the strict rules of harmony, are forbidden. See HARMONY, *Progression of Chords.*

CONSENT (OF. *consente*, from *consenter*, to *consent*, from Lat. *consentire*, to agree, from *com-*, together + *sentire*, to think). In law, the free will and assent of the mind of a competent person to some act or obligation affecting his legal rights or relations. The law prescribes under what conditions it is binding and when it is void or voidable. Thus, apparent consent obtained by fraud or coercion, or from an infant, or from an insane, intoxicated, or otherwise legally incompetent person, is deprived of all legal effect if such person chooses to avoid it. It is an essential element of contract and is of the greatest importance in certain cases in the law of crimes and torts, where the essence of the crime or wrong is that it was against the will of the person injured. One may legally consent to the infliction of a limited amount of bodily harm if there is no malice involved, as in friendly boxing or in football; but one cannot consent to the infliction of death or anything which will amount to a breach of the peace. See AGE; CONTRACT; CRIME; TORT.

CONSEN'TES DI'I (Lat. *consentes*, of uncertain etymology and meaning, probably from *com-*, together + **sens*, being, pres. p. of *esse*, to be, cf. Skt. *sant*, being, from *as*, to be; less probably for *consentiens*, from *consentire*, to agree). The 'co-existent gods,' the 12 chief Roman deities: Jupiter, Apollo, Mars, Neptune, Mercury, Vulcan, Juno, Vesta, Minerva, Ceres, Diana, and Venus. A colonnade in their honor, containing their statues, which stood at the northwest corner of the Forum, was restored as late as 376 A.D. Consult Hülsen-Carter, *The Roman Forum* (Rome, 1906).

CONSERVATION. The object of the conservation movement in the United States is to protect and develop the fullest usefulness of the great natural resources, which are the forests, the waters, the minerals, and the land. These are the chief bases, not only of material

well-being, but also of existence. Upon their conservation depends in the last analysis the growth, the continuity, and the efficiency of the nation.

The use of the natural resources of the United States has been accompanied by vast waste. In some stages of its history, and in many regions of its territory, waste of natural resources, particularly of the forests, has exceeded their beneficial use.

Owing to the work of the National Conservation Commission, appointed on June 8, 1908, by President Roosevelt, of which Gifford Pinchot was chairman and the late Dr. W J McGee his chief aid and adviser, the United States possesses the first inventory of natural resources to be made by any nation. This inventory, which was published in 1909 in the *Report of the National Conservation Commission* (Government Printing Office, Washington, D.C.), brought together all the information available from Federal, State, and private sources in order to take stock of the natural wealth still remaining in minerals, lands, forests, and waters. The more important features of this inventory may be summarized as follows:

INVENTORY OF NATURAL RESOURCES

Minerals. The annual mineral production of the United States exceeds $2,000,000,000 and supplies more than half the freight traffic of the country. The waste in extraction and treatment of mineral products is about $300,000,000 a year. It has available and easily accessible 1,400,000,000,000 tons of coal. The high-grade iron ores, which approximate 4,788,150,000 tons, will not last beyond the middle of the present century if consumption continues to increase at the present rate. The supply of the precious metals and of copper, lead, and zinc, silver, asphalt, quicksilver, and mica cannot be estimated closely, but is clearly exhaustible within one to three centuries, unless unexpected deposits be found. The known petroleum supply is 15,000,000,000 barrels, covering about 8900 square miles. Production increases rapidly, and loss through misuse is enormous. The supply cannot be expected to last beyond 50 years.

Enough natural gas, the most perfect known fuel, is wasted daily in the United States to supply every city of over 100,000 population. The consumption of nearly all the mineral products increases far faster than population. In 1776 less than 100 pounds of iron ore were in use by the average family. To-day the annual consumption per capita of high-grade iron ore is over 12,000 pounds. In 1812 the United States used no coal. Now it uses over five tons per capita, and the waste per capita is about three tons.

Lands. Two-fifths of continental America is in farms. Less than one-half the farm area is improved and made a source of crop production. The value of all the farms is nearly one-fourth the wealth of the United States. More than 10,000,000 people are engaged in agricultural pursuits.

The United States grows one-fifth of the world's wheat crop, three-fifths of its cotton crop, and four-fifths of its corn crop. Neither the increase in acreage nor the yield per acre of farm land has kept pace with the increase in population. Within a century it will probably have to feed three times as many people as now.

The average yield of wheat in the United States is less than 14 bushels per acre, in Germany it is 28 and in England 32 bushels. The United States gets about 30 bushels of oats per acre, England nearly 45, and Germany more than 47 bushels.

Agriculture in America has, on the whole, decreased soil fertility slightly instead of having increased it, as it has done in the older countries. The wild game and fur-bearing animals have been exterminated largely, and the same is generally true of the game birds.

Forests. Forests now cover about one-fourth of the United States. The original forests covered over one-third. Forestry, which means the conservation of the forests by wise use, is now practiced on 70 per cent of the forests publicly owned and on less than 1 per cent of the forests privately owned, or on only 18 per cent of the total forest area. Forests privately owned contain four-fifths of all standing timber in the United States.

The United States takes from the forests each year, not counting the loss by fire, three and one-half times their yearly growth. Forty cubic feet per acre are taken for each 12 cubic feet grown; and 260 cubic feet per capita are taken, while Germany takes 37 cubic feet, and France 25 cubic feet from their forests. Not less than 50,000,000 acres of forest is burned over every year, and forest fires destroy annually an average of 50 lives and $50,000,000 worth of timber. If the use and waste of the forest continues unchanged, all the mature timber now standing in the United States will be used up by 1965.

Waters. Less than 1 per cent of the rainfall, including snow, the sole source of the freshwater supply, is retained and utilized for municipal and community supply; less than 2 per cent is used for irrigation. Perhaps 5 per cent is used for navigation and less than 5 per cent for power. About $500,000,000 is invested in water works and the appurtenant catchment areas for municipal and community supply. About $200,000,000 is invested in irrigation works, but few of the reservoirs are large enough to hold the storm waters. The waste of water in public and private irrigation projects exceed 60 per cent, while not more than 25 per cent of water available for the irrigation of arid lands is actually used.

In the continental United States there are 287 navigable streams, or an aggregate of 26,226 miles, and as much more navigable if they were improved. There are 45 canals, aggregating 2198 miles, besides numerous abandoned canals.

Water power now in use in the United States aggregates 10,000,000 horse power. The amount running over government dams and not used is about 1,400,000 horse power. The amount reasonably available, to quote the late Dr. W J McGee, "equals or exceeds the entire mechanical power now in use, or enough to turn every mill, drive every spindle, propel every train and boat, and light every city, town, and village in the country."

So much for the waste of natural resources up to now. What is the possibility of further waste and misappropriation of the natural resources still under public control, and constituting the national forests, the public domain, and

the navigable streams? This can be answered best by discussing the purposes of the conservation movement, the results already accomplished, and those still to be attained.

THE CONSERVATION MOVEMENT

The conservation movement sprang directly from the forest movement in the United States. The United States Forest Service developed in 10 years, under the leadership of Gifford Pinchot, from a minor division in the Department of Agriculture to an organization administering in the public interest nearly 200,000,000 acres of forest land, employing 3000 persons and aiding indispensably in the growth and development of the West. Gifford Pinchot was the first man to see that the use and the misuse of all the natural resources are interdependent, that conservation of these natural resources is essential to the national and individual welfare, and that this welfare is threatened by two great evils—by unnecessary waste and by unregulated and selfish monopoly.

As President Roosevelt often and freely stated, the conservation idea as applied to all natural resources came to him from Gifford Pinchot. It was at the suggestion of Gifford Pinchot that President Roosevelt called the Conference of Governors at the White House May 13–15, 1908, which ended in a declaration whose keynote was the recognition of the great natural resources as the material bases on which civilization depends and on which rests the prosperity of the nation; the expressed conviction that conservation of the natural resources should engage the attention of the people and the nation and the States in earnest coöperation; and the declared wish and intention to preserve these foundations of prosperity.

The Conference of Governors was followed by the appointment of conservation commissions in nearly all the States and by the appointment of similar commissions representing great organized industries. The conservation movement dates as an avowed and recognized public policy from that historic Conference of Governors.

The purpose of the conservation movement, broadly stated, is to develop the fullest permanent usefulness of the great natural resources. This calls, first, for thrift in their protection and utilization; it calls also for drawing a clear line, and maintaining it, between the privileges of the few and the rights of the many in acquiring natural resources necessary to the public welfare. Conservation therefore is not merely an economic but also a moral issue. It has been defined by Gifford Pinchot as "the application of common sense to common problems for the common good."

More specifically the purposes of the conservation movement are as follows. With respect to minerals the conservation movement aims: 1. So to use ores reduced to minerals as to confine to a minimum the loss by rust, electrolytic action, and other waste. 2. To make the pursuit of mining more safe to the miner. 3. To exercise such control through the national government of the mineral fuels and phosphate rocks still in its possession as to check waste and prolong our supply. 4. To meet and satisfy the need for further surveys and investigations and for further researches concerning the less-known minerals.

The policy of the conservation movement with respect to lands is as follows: 1. Every part of the public lands should be devoted to the use which will best subserve the interests of the whole people. 2. The classification of all public lands is necessary for their administration in the interest of the people. 3. The timber, the minerals, and the surface of the public lands should be disposed of separately. 4. Public lands more valuable for conserving water supply, timber, and natural beauties or wonders than for agriculture should be held for the use of the people from all except mineral entry. 5. Title to the surface of the remaining non-mineral public lands should be granted only to actual home makers. 6. Pending the transfer of title to the remaining public lands, they should be administered by the government, and their use should be allowed in a way to prevent or control waste and monopoly. 7. The public-land laws, as a whole, do not subserve the best interests of the nation. They should be modified so far as may be required to bring them into conformity with the foregoing outline of policy.

The conservation movement aims to perpetuate the usefulness of the forests by the following means: 1. To get practical forestry practiced on all private forest lands in the United States by whatever legitimate steps may be necessary to that end, including more adequate provision for State coöperation in fire protection, and tax laws modified so as to encourage rather than discourage the practice of forestry. 2. To maintain under Federal control the forest resources which are the property of the nation. 3. To encourage and educate all wood users, large and small, to reduce the drain on the forests by lengthening the life of timber used by preservation treatment and other obvious economies of wood in use. 4. To face and meet the national task in forest planting in the United States, in order to restore to productivity lands laid waste by destructive lumbering so far as those lands are suitable only for forest purposes.

With respect to the waters the conservation movement holds that the paramount use should be water supply; next should follow navigation in humid regions and irrigation in arid regions. The development of power in the navigable and source streams should be coördinated with the primary and secondary uses of the water. Other things equal, the development of power should be encouraged, not only to reduce the drain on other resources, but because properly designed reservoirs and power plants retard the run off and so aid in the control of the streams for navigation and other uses. Broad plans should be adopted providing for a system of waterway improvement extending to all uses of the waters and benefits to be derived from their control, including the clarification of the water and abatement of floods for the benefit of navigation, the extension of irrigation, the development and application of power, the prevention of soil wash; the purification of streams for water supply, and the drainage and utilization of the waters of swamp and overflow lands.

The policy of the conservation movement as regards water powers recognizes these three essentials of a sound water-power policy: prompt development; prevention of unregulated monopoly; good service and fair charges to the consumer. Water power is clearly a natural monopoly, since it can be controlled and used by but one concern at one time. Therefore it is directly upon the terms upon which the right

to use a water-power site is granted that the prevention of the monopoly of water power directly depends. One of the most striking features of the water-power situation to-day is concentration and control. Sixty-five per cent of all the developed water power in the United States is controlled by 10 groups of power interests, several of which are closely related by interlocking directorates between the groups themselves. Concentration and control have gone forward very rapidly in recent years and have nearly doubled in the last two years. The 10 great groups of interests hold about one-third more power undeveloped than they have developed. In the last two years control of undeveloped power has increased more than twice as fast as control of developed power by the same interests.

RESULTS ACCOMPLISHED

Since its inception these are the more important achievements of the conservation movement:

The successful administration in the public interest of the national forests, which contain nearly one-fifth of all the standing timber in the United States, and put each year vast quantities of mature timber to beneficial use, protect the headwaters of every important Western river, and help to support half the sheep and nearly one-tenth of the cattle on the Western ranges.

A second achievement of the conservation movement was the construction of a railroad in Alaska which will lead from the coast to the Matanuska coal fields. Railroad development by the nation was first suggested by Gifford Pinchot, who throughout has advocated the prompt and legitimate development of all the resources of Alaska with benefit to her citizens and the nation.

The third great achievement of the conservation movement was the progress made toward the application of the principles of range administration within the national forests to the whole public domain.

A fourth great achievement in conservation was the defeat of selfish attempts of the organized power interests, formerly successful at nearly every point, to get and hold in perpetuity and for nothing unregulated control of the water powers of navigable streams in the national forests and on the public domain.

Perhaps the most striking example of the extent to which the public conscience was aroused against water-power monopoly was the meeting of the National Conservation Congress, held in Washington Nov. 18, 19, and 20, 1913, at which a sharp difference arose between Gifford Pinchot, leading the minority of the water-power committee, and other men, constituting a majority of the committee, as to the declaration to be made by the congress on the subject of water power. Gifford Pinchot held that the congress should recognize unregulated monopoly of water power and go on record solemnly against it. His opponents held differently. The result was that the congress went on record against unregulated monopoly of water power in a clear and vigorous declaration.

Another victory gained by the conservation movement, but one in which all danger has not yet passed, was the fight to hold what conservation has already won. This fight centred around the national forests and all they contain, but it also involved the attempt to cede not only the national forests but the whole public domain to the Western States. In Congress 14 bills were introduced aimed in one way or another to turn over to the States natural resources now under Federal control. The policy of these bills was advocated openly and strongly by many members in Congress. None of them passed.

There are two great reasons why the national forests should not be turned over to the Western States. One reason is that such a step would involve waste of money and effort and would impair the usefulness of the national forests to the people. The other reason is that the States are not ready for this task. So far as they have performed a similar task in the past they have done it in the main incompetently or, what is much more serious, not with an eye single to the public interest.

Ownership or control of the national forests by the Western States would entail the creation of many forest services instead of one. Few States have more than the mere beginnings of an efficient forest organization, and still fewer have an adequate machinery for getting and retaining, regardless of political considerations, efficient men for the work. But, beyond all that, is the fact that these national forests are a national resource on which depends the prosperity not of any one section or part of the people or of the country, but of the whole people and of the whole country. To develop their fullest usefulness to the whole people and to the whole country calls for their administration under national policies from the national point of view.

With regard to its political significance, the conservation movement is not in any sense a movement of any one party.

RESULTS TO BE ACCOMPLISHED

The conservation movement faces the necessity for further achievements before the natural resources are safe either from unregulated monopoly or from waste. These are as follows:

The passage of legislation for the development of the water powers of the national forests and the public domain and of interstate and navigable streams on terms fair to the people and to the power interests.

With respect to Alaska, the citizens of Alaska should be enabled to get coal promptly and easily for domestic use, and through railroad development by the government and through provision for the working of coal mines on a larger scale under lease, the utilization of this vast natural resource should be encouraged with benefit to the people.

The grazing lands of the public domain cover about one-sixth of the United States and produce most of our beef and mutton, leather and wool. Through wasteful use these lands have been so injured for grazing purposes that they feed only about one-half the stock which they would feed were their use wisely regulated. The improvement of the public range by regulated use is an essential and exceedingly important step in the reduction of the cost of living.

The needless pollution of streams is an increasing menace to health and in some instances to life itself. The pollution of the waters of any navigable stream or interstate stream or lake should be deemed an offense against the public, and subject to penalties adequate in amount to prevent its repetition.

CON'SERVA'TION OF ENERGY, PRINCIPLE OF. See MECHANICS; ENERGETICS.

CONSERVATION OF MATTER. See MATTER, *Properties of Matter.*

CONSERVATION OF WILD LIFE. See WILD LIFE, CONSERVATION OF.

CONSER'VATIVE. See WHIG; TORY; POLITICAL PARTIES, *Great Britain.*

CONSERVATIVE CLUB, THE. A Tory club founded in London in 1840. Its clubhouse is in St. James's Street.

CON'SERVA'TOR OF THE PEACE. An ancient office of great dignity and authority in England. It existed at common law as an incident of certain tenures of lands held immediately of the King; or the King might appoint one to be his warden or the conservator of his peace; and before the institution of justices of the peace certain officers were so appointed. Now the only official conservators of the peace are certain officers who hold this power annexed to the offices which they hold. The sovereign, by virture of his office, is the principal conservator of the peace in British realms. Several high officers of the crown, the Chancellor or Lord Keeper, the Lord High Steward, the Lord Marshal, and the Lord High Constable, when there are such officers, and all the justices of the High Court, are conservators of the peace throughout the whole kingdom and may commit breakers of the peace or bind them in cognizances anywhere. Other judges possess this power only within the limits of their own jurisdiction. The sheriff and coroner are conservators of the peace within their respective counties, and constables, tithingmen, etc., within their jurisdictions. The phrase is not in use in the United States. Consult Stephen, *Commentaries on the Laws of England* (13th ed., London, 1899).

CONSER'VATORY (ML. *conservatorium*, place for preserving anything, from Lat. *conservare*, to preserve, from *con-*, together + *servare*, to keep, Ar. *har*, to preserve). A school for the cultivation of music in all its branches. Besides strictly musical subjects, stage deportment and the modern languages used in singing (German, French, Italian) are usually included in the curriculum. Originally, however, a conservatory was not a school of music, but an orphan asylum or institution of a benevolent character for the care of children of the poor. Such children as showed a talent for music were educated in the art. At first this instruction was given to the inmates only, but subsequently day scholars also were admitted upon payment of a moderate fee. The oldest conservatory is the Conservatorio Santa Maria di Loreto in Naples, founded in 1537. Within the same century three more conservatories were established in the same city. By order of King Murat these were consolidated, in 1808, under the name Collegio Reale di Musica. Venice had four such institutions, which ceased to exist with the downfall of the Venetian Republic. To-day the Conservatory of Venice is known as the Liceo Benedetto Marcello. The success of these schools was so pronounced that soon conservatories were founded all over Italy. Among the best known are (1) the Regio Conservatorio di Musica, in Palermo, founded 1615; (2) the Liceo Musicale, in Bologna, founded 1804, noted for its magnificent library, the greater part of which was bequeathed to it by Padre Martini and Gaetano Gaspari; (3) the Regio Conservatorio di Musica, in Milan, founded 1807; (4) the Civico Istituto di Musica, in Genoa, founded 1829; (5) the Liceo Musicale, in Turin, founded 1865; (6) the Liceo Musicale Rossini, in Pesaro, established in 1882 by a gift of 2,300,000 lire from Rossini.

In France the necessity of a school for the education of singers led to the establishment, in 1784, of the Ecole Royale de Chant et de Déclamation. During the French Revolution, in 1793, owing to the scarcity of instrumental performers for the army, the course was extended, and the name was then changed to Institut National de Musique. In 1795 it was reorganized and has since been known as the Conservatoire de Musique. To-day it is beyond all question the most famous music school in the world. Prizes are awarded in all the classes. The highest honor conferred is the Grand Prix de Rome, which entitles the winner to a three years' stay in Italy with a single condition, that the holder send from time to time original compositions as evidence of his progress. Nearly all the famous French composers of the last century have been winners of this prize. (See PRIX DE ROME.) There is scarcely a musician of note in France who has not been at some time a professor in the conservatory. The directors since its foundation have been Sarette (the founder, 1784–1814); Perne (1814–22); Cherubini (1822–42); Auber (1842–71); A. Thomas (1871–96); Dubois (1896–1905); Fauré (1905–). One of the foremost of French institutions is the Schola Cantorum, established in 1896 by D'Indy, Bordes, and Guilmant. Originally intended as a training school for liturgical music, it soon expanded into a regular conservatory, espousing the cause of ultra-modern French music. D'Indy has been its director since its foundation.

The oldest among the German conservatories is that of Prague, founded 1811, which, in addition to the usual musical courses, offers also a liberal-culture course. The Vienna Conservatory was opened in 1817 by Salieri as a school for singing. It became a true conservatory in 1821. The most famous conservatory in Germany is that in Leipzig, founded by Mendelssohn and Schumann in 1843. Among its professors have been M. Hauptmann, L. Plaidy, E. F. Richter, Hiller, Gade, Moscheles, Reinecke, and Brendel. Among its pupils were Grieg, Sir A. Sullivan, Svendsen, Wilhelmj, Kirchner, Jadassohn. The oldest Berlin conservatory was founded in 1850 by Kullak, Marx, and Stern. Among its professors were Bülow, Kiel, De Ahna, B. Scholz. The Neue Akademie der Tonkunst (chiefly for piano) was opened in 1855 by Kullak. The most important of the Berlin conservatories is the Königliche Hochschule für Musik, a branch of the Royal Academy of Arts. It is divided into three parts: (1) Königliches Institut für Kirchenmusik; (2) Abteilung für musikalische Komposition; (3) Abteilung für ausübende Tonkunst. Among the professors have been Joachim, Ph. Spitta, Bargiel, Herzogenberg. The Conservatory of Cologne was founded in 1850 by Hiller. The Dresden Conservatory was founded 1856, and that of Stuttgart in the same year. The famous Königliche Musikschule in Munich, founded 1867, offers, besides the musical, liberal-culture courses. Among the other famous German conservatories of to-day are those in Würzburg, Frankfort, Hamburg, Breslau, Strassburg, Karlsruhe, Regensburg (church music). Besides these public or state conservatories there are

also a number of not less famous private conservatories, such as those of Scharwenka, Schwanzer, Klindworth, Freudenberg. Switzerland also boasts some efficient conservatories in Geneva, Zurich, Basel, Bern. One of the greatest and best-known conservatories is that in Brussels, founded 1813, among the directors of which were Fétis and Gevaert. The conservatories in Liège and Ghent are also famous. In Antwerp Peter Benoit founded, in 1867, entirely after German models, the well-known Vlaamsche Muzickschool. Nor is Holland behind in the efficiency of her conservatories. The Maatschappij tot bevordering van tonkunst was opened in 1862 at Amsterdam. Also the conservatories in Rotterdam and The Hague have risen to importance. The oldest conservatory in Russia is that of Warsaw, founded 1821; the most famous, that in St. Petersburg, established 1862. Among its professors were Zaremba, Anton Rubinstein, Leschetitzky, Wieniawski, Davidoff, and Tschaikowski. A conservatory was also founded in Moscow in 1864 by Nicholas Rubinstein.

In England we find five conservatories in London—the Royal Academy of Music (1822); the London Academy of Music (1861); the Trinity College Conservatory (1872); the Guildhall School of Music (1880). The best of all is the Royal College of Music, established originally by Sir Arthur Sullivan as the National Training School of Music (1876). Sir George Grove was the first director under the reorganized administration (1883–94). He was succeeded (1894) by C. H. Parry. All other European countries have now conservatories of more or less importance.

In the United States music has made enormous strides within the last quarter of a century, and conservatories have been founded in nearly all the larger cities. Among the best known are the Chicago College of Music (1867), the Peabody Conservatory in Baltimore (1871), the Cincinnati College of Music (1878), the New England Conservatory of Music in Boston (1882), the National Conservatory of Music of America in New York (1885), the Guilmant Organ School in New York (1898). Perhaps the most richly endowed of all is the Institute of Musical Art in New York (1905). Besides, some of the great American universities have added a complete course of music to their regular curriculum, as Harvard (W. R. Spalding), Yale (Horatio W. Parker), Columbia (C. Rübner), University of Pennsylvania (A. A. Clarke), University of Michigan (A. A. Stanley).

CONSERVATORY. In horticulture, a glass house used for the preservation of tender exotics and the display, rather than the propagation or growing, of plants which have been brought to their ornamental perfection in a greenhouse. The term is often applied loosely to any ornamental greenhouse. See GREENHOUSE.

CON'SHOHOCK'EN. A borough in Montgomery Co., Pa., 13 miles northwest of Philadelphia; on the Pennsylvania and the Philadelphia and Reading railroads, and on the Schuylkill River (Map: Pennsylvania, L 7). The more important industrial establishments include rolling mills, steel mills, foundries, furnaces, surgical-implement works, rubber works, and cotton and woolen mills, the principal products of which form the basis of extensive trade. Conshohocken was founded in 1830 and was incorporated as a borough in 1852. Pop., 1890, 5470; 1900, 5762; 1910, 7480.

CONSIDÉRANT, kŏn'sē'dā'rŭn', VICTOR PROSPER (1808–93). A French socialist, born at Salins, in the Department of Jura. After being educated at the Ecole Polytechnique in Paris, he entered the army, which, however, he left, after attaining the rank of captain of artillery, in order to promulgate the doctrines of Fourier. After the death of his master Considérant became the head of the Societarians, or Fourieristic sect, and undertook the management of their organ, the *Phalange.* Having gained the financial support of a young Englishman, Mr. Young, he established (1832) on a large scale, in the Department of Eure-et-Loir, a Socialist colony, or *phalanstère;* but the experiment failed, and with it the *Phalange* went out of existence. In 1843 Considérant founded a new organ of cooperative doctrine, the *Démocratie pacifique,* and conducted it with great zeal, perseverance, and ability. In 1848–49 he was a member of the Constituent Assembly, but was accused of high treason and compelled to flee to Belgium. In 1852 he visited America and associated himself with Albert Brisbane and other leaders of the Fourieristic movement in America. He traveled to the Mississippi valley, in search of cheap land upon which to found a great colony. He fixed upon a tract of land in Texas, near the Red River, and, returning to Belgium, procured from Godin (q.v.) a capital of 100,000 francs with which to launch his project. In 1854 he returned to America with 200 colonists, with whom he inaugurated his colony under the name of La Réunion. The colony proved a failure, and in 1869, deserted by all his followers, Considérant returned to France. The work by which he is best known is his *Destinée sociale* (1834–45), which is, however, little more than a summary of the doctrines of Fourier. His most original work is his *Socialisme devant le vieux monde* (1849). In spite of his Socialism Considérant was a conservative in religion and an enemy of revolution. See FOURIER; FOURIERISM.

CONSIDERATION (Lat. *consideratio,* from *considerare,* to observe, from *com-,* together + *sidus,* star). In the law of contracts, a detriment or the surrender of a right by one party in exchange for the promise of the other party. In case of a bilateral contract, i.e., one in which the promises are mutual, each promise is a consideration for the other. A consideration is essential to a valid simple contract. A mere promise made without a consideration is called by lawyers a naked promise (*nudum pactum*), and on it suit will not lie. Such a promise, even though made in writing, is not a valid legal contract. The requirement of consideration as a necessary element in a simple contract is due to the historical development of the contract action of assumpsit (q.v.) as an action in tort. In that action the plaintiff was required to show that he had given up a right or suffered some detriment in reliance upon, or in exchange for, the defendant's promise, by reason of which he had been damaged. Thus, a consideration need not be in the form of a direct benefit to the contracting party, but may be something involving loss or prejudice to the second party to the contract. On the other hand, a promise to reward another for performing his legal duty cannot be enforced, since the performance of a legal duty is not the surrender of a right or any detriment in a legal sense. Thus, the promise of a debtor to pay his debt is not a consideration for a contract, as the promisor is already under a legal obligation to pay his debt. If,

however, the promise is made after the debt is barred by the statute of limitations, the promise has the effect of reviving the obligation and may be sued upon although no consideration is given for it. This is anomalous. The law takes no account of the adequacy of consideration if the contract is made in good faith; but if inadequacy results from fraud or mistake, the contract may be rendered void or voidable according to the circumstances of the case. If the consideration given is contrary to public policy, or is a promise to do an illegal act, the contract based theron is illegal and void. See CONTRACT; MISTAKE; FRAUD.

CONSIGNMENT (from Fr. *consigner*, to consign, from Lat. *consignare*, to seal, from *com-*, together + *signare*, to sign, from *signum*, sign). In mercantile law, a quantity of goods delivered by one party, called the consignor, to another, called the consignee, for custody, for transportation, for sale, or pursuant to a contract for their sale. When they are delivered to a common carrier for transportation, the consignment is generally evidenced by a *bill of lading* (q.v.). See BAILMENT; CARRIER, COMMON; FACTOR.

CONSIS'TORY (Lat. *consistorium*, from *consistere*, to stand together, from *com-*, together + *sistere*, to station, from *stare*, to stand). Properly a place of assembly, but in later Latin the word came to mean a particular place where the Council of the Roman Emperor met, and, after the time of Diocletian and Constantine, the Council itself, which became the supreme judicial tribunal of the later Roman Empire. Up to the time of Marcus Aurelius, the Roman Emperor frequently exercised in person the supreme judicial authority, which covered matters brought directly before him for decision, as well as appeals from the judgments of the provincial prætors in all parts of the Empire. In the troublous times which succeeded, this function was devolved upon a council, made up largely of jurists, which acted in his name, and whose judgments were of equal authority with statutes immediately promulgated by him. These judgments of the consistory were known as decrees (*decreta*) and formed an important part of the Imperial legislation (*constitutiones*) of the later Empire. In the membership of this Council were the Imperial officials, and its function was to deliberate on the important affairs of legislation, administration, and justice. The *form* of the Imperial consistory passed over into the early Christian Church. The bishops established their consistories, and the name was applied to the assemblies of the Roman clergy and the bishops of the suburban sees, out of which the College of Cardinals has developed. Public consistories are now held in the Vatican for formal functions, such as the giving of the hat to a cardinal, the final pleadings on the question of canonization, or the reception of an ambassador. Secret or ordinary consistories, to which none but cardinals have access, discuss a variety of administrative matters, such as the erection of new sees and the nomination of cardinals and bishops. The detailed work, however, is done in the committees, which are known as "consistorial congregations." (See CONGREGATION.) Semipublic or extraordinary consistories contain bishops in addition to the cardinals, and take a final vote on proposed canonizations. In the Greek church each bishop has his own consistory of three to seven members nominated by him and confirmed by the Holy Governing Synod. An appeal lies from the consistory to the bishop and from the bishop to the synod.

In English ecclesiastical law, the consistory, or consistorial court, is the tribunal in which the bishop exercises his ordinary legal jurisdiction. This jurisdiction was formerly very extensive, including the trial for common-law offenses of clerks, or persons entitled to claim exemption from the process of the secular tribunals (see BENEFIT OF CLERGY), and to a very recent date the cognizance of all matrimonial causes, the probate of wills, the administration of decedents' estates, etc. The reform of the judicial procedure in England in 1857 transferred the latter classes of cases to the jurisdiction of the ordinary tribunals, leaving to the consistorial courts only their more strictly ecclesiastical jurisdiction. In general, an appeal lies from the judgment of the consistory court to that of the archbishop—the Court of Arches (of Canterbury)—or the Chancery Court of York. The presiding officer of the consistory is the chancellor of the diocese, his judicial title being variously the ordinary, the official principal, and vicar general. See those titles; also ECCLESIASTICAL COURTS; CANON LAW; and consult Phillimore, *Ecclesiastical Law of the Church of England* (2d ed., London, 1895).

In the Lutheran state churches the consistory is a board of clerical officers either national or provincial, usually appointed by the sovereign and charged with various matters of ecclesiastical administration. These bodies exercise a supervision and discipline over the religion and education of the people, as well as over the clergy and the schoolmasters, and examine the candidates for the ministry for license and ordination. They have also the regulation of public worship and the administration of church property. In the Protestant churches of France the consistory exercises a more restricted jurisdiction than in Germany. In the Reformed (Dutch) church the consistory is the lowest ecclesiastical court, having charge of the government of the local church and corresponding to the session of a Presbyterian church.

CONSOLACIÓN DEL SUR, kōn'sō-lä'thē-ōn' dĕl sōōr (Sp., Consolation of the South). A town in the Province of Pinar del Río, Cuba, about 15 miles northeast of Pinar del Río (Map: Cuba, B 4). It is in the midst of the Vuelta Abajo District, one of the most famous in Cuba for fine tobacco. Pop., 1899, 3062; 1907, 3414.

CONSOLATO DEL MARE, kōn'sō-lä'tō dĕl mä'rā (Consulate of the Sea). A code of maritime law, compiled, it is believed, at Barcelona in the fourteenth century and made up of the settled usages, as to trade and navigation, of the maritime communities of the Mediterranean. The earliest copy known was published at Barcelona, in 1494, in the Catalan language. It contains (1) a code of procedure issued by the kings of Aragon for the guidance of the courts of the consuls of the sea; (2) a collection of ancient customs of the sea; and (3) a body of ordinances for the government of cruisers of war. It enjoyed considerable authority and has passed, by legislation and by judicial adoption, into the maritime law of Europe and America. Its provisions were largely embodied in the French Maritime Code of 1681 (*Ordonnance sur la marine*). The code was translated into Italian and printed in Venice in 1549, and French, Dutch, German, and English translations have also been made. The most valuable

portion, the customs of the sea, will be found printed in English in the appendix to the *Black Book of the Admiralty* (London, 1874). Consult: Robinson, *Collectanea Maritima* (London, 1801); Pardessus, *Collection des lois maritimes antérieures au 18ème siècle* (Paris, 1828–45); Reddie, *Researches, Historical and Critical, in Maritime International Law* (Edinburgh, 1844–45); Wheaton, *History of the Law of Nations in Europe and America* (New York, 1845); Schaube, *Das Konsulat des Meeres in Pisa* (Leipzig, 1888); Valroger, *Etude sur l'institution des consuls de la mer au moyen-âge* (Paris, 1891).

CONSOLE, kŏn'sōl (Fr., probably ultimately from Lat. *consolidare,* to strengthen, from *com-,* together + *solidus,* firm). In architecture, a projection in the form of a letter S or of a single or double scroll, used to support cornices, or sometimes busts, vases, figures, etc. Consoles are often richly ornamented and are, in fact, sometimes purely decorative features, differing in this from brackets (q.v.) and corbels (q.v.), which have a structural function. The name is also applied to a table fixed against a wall, the front carried on curved supports instead of straight legs.

CONSOLIDATION (Lat. *consolidatio,* from *consolidare,* to strengthen) **ACTS.** Statutes which combine in a single act all previous statutes relating to, and coming under, the same general subject matter. As a general rule, this cannot be done by a mere collocation, or gathering together under one head, of acts of different dates in their original form; but they must be rewritten, arranged in sections, all inconsistencies and surplusage be omitted, and uniformity of expression obtained, so that the whole may be a complete and logical act. Frequently, in order to do this, amendments to many of the measures which it is proposed to bring together are passed, and then they are reënacted by the consolidation act. The meanings of various technical terms in the statutes are usually defined and explained in a sort of prefix, which is made a part of the whole and is thus binding on the courts. The acts which are consolidated, and thereby superseded, are repealed by an express provision in the same measure. Consolidation measures have proved successful in England in rendering their statute law more simple and concise. Several of the United States have followed the idea, but generally have gone further, and enacted all the existing law on a given subject, whether contained in statutes or decisions, and the result is more in the nature of a codification act than a consolidation act as known in England. See Code; Revised Statutes.

CONSOLS'. A contraction of the words "consolidated annuities." In incurring the English debt, the government borrowed money at different periods on special conditions, generally the payment of an annuity of so many per cent on the sum borrowed. Great confusion arising from the variety of stocks thus created, it was thought expedient to strike an average of their value and consolidate them into one fund, kept in one account at the Bank of England. The Consolidated Annuities Act was passed in 1757.

CON'SONANCE (Lat. *consonantia,* from *consonare,* to sound together, from *com-,* together + *sonare,* to sound, from *sonus,* Skt. *svana,* sound, from *svan,* to resound), or Concord. In music, the simultaneous sounding of two or more tones belonging to the same major or minor triad. The effect upon the ear is entirely satisfying, so that further progression or resolution is not required, as it is in the case of dissonance (q.v.). This feeling of rest is attributed to the simple ratios existing between the number of vibrations of consonant intervals, whereas the ratios between dissonant intervals are complex. Consonant intervals are the unison, perfect fourth, fifth, and octave, as well as major and minor thirds and sixths. (See Interval.) Chords formed by only consonant intervals are consonant chords. They are of two kinds, major and minor triads; the major triad consisting of tonic, major third, and perfect fifth, the minor composed of tonic, minor third, and perfect fifth. See Acoustics; Chord; Harmony; Triad.

CON'SONANT. See Letters; Alphabet.

CON'SORT (Lat. *consors,* partner, from *com-,* together + *sors,* lot; probably connected with Lat. *serere,* Gk. *εἴρειν, eirein,* Skt. *si,* to join together). A term applied to the husband or wife of a reigning sovereign, viewed in a public capacity. Whatever political influence may attach to the position, the probability that the consort will attempt to secure some share in the royal prerogative is naturally greater where the consort is the husband; and as the royal spouse is most frequently a foreigner, national legislatures have always been careful to restrict his activity to the ornamental functions of royalty. In some cases, however, the husbands of ruling sovereigns have been granted a share in the government, a notable instance being that of Ferdinand of Aragon, who on his marriage to Isabella of Castile was declared joint ruler of that country. Prince Consort was the official title of Prince Albert Saxe-Coburg-Gotha after his marriage to Queen Victoria of England.

CONSPIRACY (OF. *conspiracie, conspiratie,* from Lat. *conspirare,* to conspire, from *com-,* together + *spirare,* to breathe). As a criminal offense this has been judicially defined as "a combination by two or more persons, by some concerted action, to accomplish an unlawful purpose, or to accomplish a purpose not in itself unlawful, by unlawful means." It will be observed that the gist of the offense is the agreement or confederation of the conspirators; an overt act pursuant to the agreement is not necessary to the completion of the crime, although, in most cases of conspiracy, such acts are performed. This doctrine of the common law has been changed by Federal legislation and by statute in many of the United States. Under such legislation the commission of an overt act to effect the object of the conspiracy is essential to consummate the crime; but as soon as that act is done the offense of conspiracy is complete and is not in any way affected by the nature or results of the act, even though the act be such that it could not possibly accomplish the conspirator's intention.

When a conspiracy has been entered into, the conspirators become so related legally that the acts or statements of any of them in reference to the common purpose are admissible against all—each is the authorized agent of all. This rule often induces the public prosecutor to have persons indicted for a conspiracy, even when their confederation has resulted in the commission of other crimes, such as treason or murder.

Some of the more important common-law conspiracies were those to commit treason or sedition, to murder, to cheat and defraud, and to maliciously injure another. They were mis-

demeanors only. Statutory conspiracies, i.e., acts declared by legislation to be punishable as conspiracies, have been raised to the rank of felonies in some instances.

Whether conspiracy is a civil wrong of itself is a question upon which judges and writers differ. There is eminent authority for the view that it is a distinct tort—an actionable wrong, without respect to the consequences of the acts done pursuant to the confederation. The prevailing view at present, however, both in England and in the United States, is that the gist of the civil cause of action is the actual damage done to the plaintiff, not the agreement or confederation against him.

Consult: Wright, *Law of Criminal Conspiracies* (London, 1873; Philadelphia, 1887); Bishop, *New Commentaries on the Criminal Law* (Boston, 1900); id., *Commentaries on the Non-Contract Law* (Chicago, 1889); also *Encyclopædia of the Laws of England* (2d ed., London, 1907).

CONSTABLE, kŭn'stà-b'l (OF. *conestable,* Fr. *connétable,* from ML. *conestabulus, comestabulus, comistabuli,* constable, from Lat. *comes stabuli,* count of the stable). 1. An officer of great dignity and authority in the Eastern Roman Empire, whence the office passed, with varying functions but no loss of authority, to the Western nations of Europe. The Constable of France, as commander in chief of the army and navy and chief arbitrator in chivalry, became the most powerful officer and dignitary in the state after the King, and because of the danger to the crown that lurked in its greatness, the office was abolished by Richelieu in 1627. The dignity was revived by Napoleon Bonaparte, but again abolished after the restoration of the monarchy. Across the Channel the office existed with similar functions, under the title of Lord High Constable of England, but it never attained the authority which attended it in France, and it was suspended for reasons of economy by Henry VIII. It is now filled by temporary appointment on great occasions of state, as the coronation of the monarch, etc. Formerly the Lord High Constable, in conjunction with the Earl Marshal of England, held the courts of chivalry, or honor, and the courts-martial of the kingdom. But the former jurisdiction has now completely lapsed, and courts-martial are held by the ordinary military authorities. The court of the constable and marshal, therefore, while still nominally in existence, is practically obsolete. The office of constable still survives in Scotland, where it has become an hereditary dignity of the earls of Errol, but shorn of its former authority.

2. The office of constable also existed in England with the signification of warden or keeper of certain royal castles and fortified towns. In a few cases it long survived as an hereditary office, and in some others it is filled by royal appointment. Of the latter class are the constables of the Tower of London and of Windsor and Dover castles.

3. The peace officer whom we know as constable is the petty constable of English law, an officer of great antiquity—so called to distinguish him from the High Constables of Hundreds, created by the Statute of Winchester, 13 Edw. I (1285). The office has in recent years lost much of its importance in England, the institution of county and borough police having deprived it of most of its functions. In most of the United States, however, outside the cities, the constable continues to be the principal officer of the peace. As such he is invested with large powers of arresting, imprisoning, executing civil and criminal process, and often with limited judicial functions. His duties are generally defined by statute. In cities, as in English boroughs and counties, his functions have generally been transferred to the police (q.v.). Consult: Bacon, *New Abridgment of the Law,* title *Constable;* Dalton, *The Country Justice: Containing the Practice, Duty, and Power of the Justices of the Peace.* See PEACE; SHERIFF.

CONSTABLE, ARCHIBALD (1774–1827). A Scottish publisher, born at Carnbee, Fife. He became famous for the sumptuousness of his editions and the liberality shown towards his employees. He published nearly all of Sir Walter Scott's works, and his failure in 1826, with that of Ballantyne and Company, involved Scott for £120,000. Constable became publisher of the *Scots' Magazine* (1801) and of the *Edinburgh Review* (1802), and owner of the *Encyclopædia Britannica* (1812), which he enlarged. He edited the *Chronicle of Fife* (1810) and wrote a *Memoir of George Heriot* (1822). Consult Constable, *Archibald Constable and his Literary Correspondents* (3 vols., Edinburgh, 1873), and Lockhart, *Life of Scott* (7 vols., London, 1838).

CONSTABLE, HENRY (1562–1613). An English poet. He was graduated from St. John's College, Cambridge, in 1580, became a Roman Catholic and therefore found it best to live mostly on the Continent. He died at Liége, Oct. 9, 1613. He wrote many pretty pastorals and sonnets to Diana, sometimes marred by fantastic conceits. His one independent publication was *Diana,* which first appeared in 1592 in pamphlet form, to reappear in 1594 (though wrongly dated 1584) with additional poems, and to be augmented, from manuscripts, in 1813 by H. J. Todd. It is interesting for the place it takes in the early development of the sonnet in England. Constable contributed four pastorals to *England's Helicon* (1600), and sonnets to other collections. Sixteen "Spiritual Sonnets," attributed to him, were first printed by T. Park in *Heliconia* (1815). Constable's contribution to English song is slender, and the authenticity of many of the poems attributed to him is not established by evidence. It was his fortune to be associated through his poetry with Shakespeare and Sir Philip Sidney. The former pays him the compliment of borrowing from his verse; and the latter's *Apology of Poetry* (1594) is prefixed by sonnets by Constable, addressed to the author of that book.

CONSTABLE, JOHN (1776–1837). An English landscape painter, the founder of modern landscape art. He was born on June 11, 1776, in East Bergholt, Suffolk, the son of a wealthy miller. His father intended him for the clergy and afterward tried him as a miller, but the youth's taste was all for art. He first studied painting in company with a local amateur named Dunthorne, with whom he painted the scenes about his native home, always in the open air. In 1795 he went to London in order to study painting, but was recalled soon afterward. In 1799 he returned to London and entered the Academy School, where he received instruction from Farrington and Reinagle. He was greatly impressed with the works of Ruysdael in the National Gallery. At first he attempted portraits and historical subjects, according to the custom of the day, but in 1803, weary of studying pictures and of acquiring

truth second-hand, he returned to East Bergholt. From this time he painted landscapes from nature only, passing at least the summer months entirely in the country near his home.

His work, however, was too revolutionary and original to become popular in his native land, although he found a few devoted friends who believed in him and bought his pictures. Among these were Sir George Beaumont, the Mæcenas of his boyhood, Bishop Fisher, of Salisbury, and his nephew, Archdeacon Fisher, Constable's most intimate friend, and, above all, Miss Maria Bicknell, whom he afterward married. He did not sell a single landscape to a stranger until 1814, but was compelled to support himself by painting portraits and copies of paintings. But, never discouraged, he worked on in his quiet way, knowing well that the future was his. At length he found recognition in France. In 1823 three of his pictures were exhibited at the Salon, where they excited the greatest admiration and were accorded the place of honor in the exhibition. The King of France sent Constable a gold medal, and the same honor was accorded to him in the following year at Lille. At last, in 1829, came the tardy honor of membership in the Royal Academy, but accompanied by an ungracious remark on the part of the president and too late to afford satisfaction to the painter.

Constable was a simple and noble character, who bore bravely discouragement and adversity and never wavered in his ideal of art. His other great passion in life was his love for his wife, Miss Maria Bicknell, to whom, after many difficulties, he was secretly wedded in 1816. With a family of seven children, he was sometimes hard pressed for money, until he was at length relieved by his own inheritance and the ample inheritance of his wife. In 1827 he removed to his favorite Hampstead, where many of his best pictures were painted. He was greatly bereaved by the death of his wife in 1828 and died unexpectedly on March 30, 1837.

Constable was a great innovator in landscape painting, and he is, more than any other, the father of the modern school. The old Dutch masters gained their effects by giving the forms of objects, placing more weight upon drawing than upon color, in which they achieved harmony by a uniform brown tone. Constable saw that landscape is rather a problem of light and air, and that its effect depends upon the light and shadow in which the objects are seen. He was the first to paint the subtle gradations of the atmosphere and to show not only the objects themselves, but how he saw them. He laid on his colors fresh and fair, as they are in nature, applying to oil paintings the results of water color. His pictures are always harmonious in tone. He renders the effect of a landscape, suppressing unimportant details—a tendency which increases with his later years. He frequently uses the palette knife, sometimes executing the entire picture by this means. In consequence of his teachings an able group of landscape painters arose in England in the forties and fifties, the most important of whom was David Cox (q.v.). His influence upon British painting during the last three decades has been even greater. His influence on the Barbizon masters has, however, been exaggerated. See BARBIZON, PAINTERS OF.

Constable's work may best be studied in the national collections of London, which have received valuable legacies of his paintings from his descendants. In the National Gallery are the "Cornfield" (1826), "Valley Farm" (1835), "Hay Wain," and many others; in the Tate Gallery, "The Bridge at Gillingham," "Harwich; Sea and Lighthouse," etc.; in South Kensington Museum, "Deadham Mill" (1820); "Hampstead Heath" (1823); and "Water Meadows near Salisbury," besides many other paintings, water colors, and many admirable studies. He is also well represented in the English provincial museums, in the Louvre ("Hampstead Heath"); in the Metropolitan Museum, New York, by "Bridge on the Stour" and the splendid "Scene on the River Stour," called "The White Horse" (J. P. Morgan collection); in the Wilstach collection, Philadelphia, the Toledo Art Museum, and other private collections of the United States. Twenty of his chief works were published in 1833 in a series of etchings, and others in 1855, by David Lucas.

A.* (London, 1903); Henderson, *Constable* (ib., 1905); Tompkins (ib., 1907); Bankart (ib., 1910).

CON'STANCE (Ger. *Konstanz* or *Kostnitz*). A fortified border city of the Grand Duchy of Baden, situated 1300 feet above sea level, on both banks of the Rhine where it leaves Lake Constance, about 35 miles northeast of Zurich (Map: Germany, C 5). Two old city gates mark the remains of its ancient fortifications. The cathedral, founded in the eleventh century and rebuilt in the fifteenth, has fine hand-carved oak portals and choir stalls. Here Huss was sentenced by the council to be burned at the stake. Other ecclesiastical buildings of interest are the church of St. Stephen and, on an island, the Dominican monastery in which Huss was confined. Notable secular buildings include the old Kaufhaus, containing the hall in which the conclave of cardinals met to elect a pope at the time of the famous council in 1417; the Rosgarten, the former guildhall of the butchers, containing an interesting museum; the town hall, with the ancient city archives; and the Barbarossa Inn, where Frederick of Barbarossa signed a treaty with the cities of the Lombard League in 1183. Constance has manufactures of chronometers, wool, linen, cotton, carpets, soap, and chemicals. Pop., 1900, 21,345; 1910, 27,591. The Roman *Constantia* was known at least as early as the third century. In 570 it was made the seat of a bishopric, which existed as one of the most powerful in Germany until its secularization in 1803. In 780 Constance was given municipal rights and in 1192 was made a free Imperial city. For joining the Schmalkaldic League it was deprived of its Imperial privileges in 1548 and presented to Archduke Ferdinand of Austria. In 1806 it became a part of the Grand Duchy of Baden. Consult: *Geschichte der Bischöfe von Konstanz* (Innsbruck, 1894–96); *Chroniken der Stadt Konstanz* (1890–92); A. Maurer, *Der Uebergang der Stadt Konstanz an das Haus Oesterreich* (Frauenfeld, 1904).

CON'STANCE. 1. Daughter of the Emperor and eventually the wife of King Alla, in Chaucer's *Man of Law's Tale*. 2. The mother

JOHN CONSTABLE

"THE HAY WAIN"

FROM THE PAINTING IN THE NATIONAL GALLERY, LONDON

of Prince Arthur, in Shakespeare's *King John*. 3. Nonesuch's daughter, enamored of Lovely, in Dryden's *Wild Gallant*. 4. The heroine of Brome's *The Northern Lass*. 5. Fondlove's daughter and Wildrake's mistress, in Knowles's comedy *The Love Chase*. 6. The daughter of the Provost, later proved a serf, in G. W. Lovell's *Provost of Bruges*.

CONSTANCE, or **CUSTANCE**, DAME CHRISTIAN. A rich and beautiful widow in Udall's play *Ralph Roister Doister*.

CONSTANCE, COUNCIL OF. The sixteenth ecumenical Church council (1414–18) called by Pope John XXIII, at the suggestion of the Emperor Sigismund, to attempt to heal the papal schism (see SCHISM, WESTERN), the scandal of which was then at its height; to deal with the Hussite heresy; and to consider measures for the general reform of the Church. It was the most brilliant and numerously attended Church council ever held. Dignitaries of church and state, with large retinues, attended from all the countries of Europe; and many merchants and artisans, with a miscellaneous crowd, were attracted by the occasion. It is said that more than 18,000 priests, and in all about 100,000 strangers, were gathered in the city. The predominating influence of Pope John was nullified by a decision to vote by nations rather than by individuals, and it was proposed that all the three rival popes should abdicate. John fled from the city and attempted to dissolve the council, which then (April, 1415), under the lead of Jean de Gerson (q.v.), declared itself the highest authority of Christendom and above the Pope. John was deposed and condemned to imprisonment for life. Gregory XII voluntarily withdrew, and Benedict XIII was deposed and retired to Spain, where he spent the remainder of his life, without power or influence. The election of a new Pope was temporarily postponed. Huss was condemned after a turbulent trial, and burned at the city gate, July 6, 1415. Jerome of Prague was also condemned, and perished at the stake, May 30, 1416. The movement for reform came to nothing. A beginning had been made, when the cardinals, with the help of the French, succeeded (November, 1417) in ending the schism and electing Otto Colonna (Martin V) Pope, who brought the proceedings to an end with some slight concessions. Consult: Richtenthal, *Kronik des Konziliums in Konstanz* (Augsburg, 1533; new ed., Tübingen, 1882); Leufant, *History of the Council of Constance* (Eng. trans., London, 1730); Finke, *Forschungen und Quellen zur Geschichte des Konstanzer Konzils* (Paderborn, 1889); Creighton, *A History of the Papacy during the Reformation* (London, 1882); Wylie, *The Council of Constance* (ib., 1900). See JOHN XVIII; GREGORY XII; MARTIN V; HUSS, JOHN; JEROME OF PRAGUE.

CONSTANCE, LAKE (named from the city of *Constance*, Ger. *Konstanz*, or *Kostnitz*, Lat. *Constantia;* German *Bodensee*, formerly *Bodemsee, Bodmensee, Bodmansee*, from the castle of *Bodman* on its shores, ML. *Lacus Podamicus, Mare Podanum*, Lat. *Lacus Brigantinus, Lacus Venetus et Acronius*). A lake of glacial origin, situated at the north base of the Alps and forming a portion of the boundary between Switzerland and Austria (Vorarlberg) on the south, and the German states of Baden, Württemberg, and Bavaria on the north (Map: Switzerland, D 1). It is on the course of the Rhine, which enters from the south and flows out in a westerly direction. Lake Constance extends northwest and southeast, and at its northwest end forks into a northern prolongation known as Ueberlinger See, which has a broad connection with the main lake; and into a southern fork, called the Lower Lake (Untersee), formerly known as the Zeller See, connected with the main lake by a narrow channel, 600 to 1600 feet wide, and only 2½ miles long. The outlet of the lake is at the foot of this arm. The height of its surface is 1309 feet above sea level; the length of the lake is about 40 miles; the greatest breadth, 10½ miles; the length of shore line, 160 miles, and the area, 208 square miles. The greatest depth is 827 feet. The water of the lake is subject to sudden rises of from 3 to 12 feet, due to the melting of the snows. A number of minor streams discharge into the lake, nearly all of them on the northeast side. Among these tributaries are the Bregenzer Ach, Leblach, Argen, Schussen, Steinach, Ach of Uhldingen, and Stockach.

The lower lake is covered with ice nearly every winter, but it is only rarely, in an extreme winter, that the surface of the main lake becomes frozen. The lake contains 26 varieties of fish, among them salmon and salmon trout, and 22 species of shellfish. In prehistory the shallows of Lake Constance were the seat of an extensive community of lacustrine culture; the remains of its pile dwellings have yielded richly of primitive artifacts which have been subjected to such exhaustive study as to establish the Lake of Constance as the most important source of knowledge of this stage of human society. Lake Constance formerly extended much farther south than at present, and even within historic times, in the fourth century, it extended as far as Rheineck (Rheinegg). The towns on the shores of Lake Constance are Bregenz, Lindau, Friedrichshafen, Ueberlingen, Constance, Arbon, and Rorschach. Steamboats navigate the lake, and railways follow its shores.

CON'STANS. In the old romances, a king of Britain, and grandfather of Arthur.

CONSTANS, FLAVIUS JULIUS. A Roman Emperor (337–350 A.D.). He was the youngest son of Constantine the Great (by Fausta) and was born 323 A.D. (or 320). He was made Crown Prince (*Cæsar*) in 333 and became Emperor, together with his brothers Constantine and Constantius, on the death of their father in 337. Constans received the government of Italy, Illyricum, and Africa. In 340, however, war broke out between the brothers, and Constantine was killed near Aquileia. Constans now ruled also his brother's dominions. He was killed by a soldier of the self-proclaimed Emperor, Magnentius, January, 350.

CONSTANS, kôn'stäns', JEAN ANTOINE ERNEST (1833–1913). A French statesman, born at Béziers. He was a professor of law in 1876, when he was elected a deputy and affiliated with the Left Centre. He was Undersecretary of State in the Freycinet cabinet in 1879, and was Minister of the Interior in the Freycinet and Ferry cabinets (1880 and 1881). After serving for one year as Governor-General of Indo-China, he was compelled in 1888 to resign this position as incompatible with his duties as a deputy. From 1889 to 1892 he was again Minister of the Interior (in the cabinets of Tirard and Freycinet), and his vigorous measures served to over-

throw Boulangism. In 1897 he was elected to the Senate, and in the following year became Ambassador to Constantinople.

CONSTANT, kôn'stäN', BENJAMIN JEAN JOSEPH BENJAMIN, also written BENJAMIN-CONSTANT (1845–1902). A French historical and portrait painter. He was born in Paris, June 10, 1845, studied at the Ecole des Beaux-Arts in Toulouse, and in 1866 obtained a municipal prize entitling him to free instruction in the Beaux-Arts in Paris, where he was also a pupil of Cabanel. A journey to Morocco in 1872 strongly influenced his artistic development. Among his chief Oriental scenes are the "Last Rebels" and "Justice in the Harem," both in the Luxembourg Gallery, "Les Chérifas," and "Moroccan Prisoners" (Bordeaux). His large canvas, "The Entrance of Mahomet II into Constantinople" (Toulouse Museum), received a medal in 1876. All these works show him to be a fine colorist and a master of technique. After 1880 he changed his manner, devoting himself to mural decorations and to portraits. The most prominent examples of the former are a great plafond in the Hôtel de Ville, Paris, entitled "Paris Convoking the World," his paintings in the New Sorbonne, representing "Literature," "The Sciences," and the "Academy of Paris," and the plafond of the New Opéra Comique. He painted important mural decorations in other cities of France and was distinguished also as a portrait painter, especially in England, where he was a favorite of the aristocracy. A good example of his portraiture is "Mon Fils André" (Luxembourg), which took the medal of honor at the Salon in 1896. His more recent sitters include Pope Leo XIII and Queen Alexandra of England (1901); Lord Savile and M. de Blowitz (1902). Constant was made a member of the Institute in 1893, and was a commander of the Legion of Honor. He visited the United States several times and painted a number of portraits, now in private possession. The Metropolitan Museum of New York possesses a large mural decoration by Constant representing "Justinian in Council." Constant was a writer of repute, having contributed a number of studies on contemporary French painters. Consult Stranahan, *Modern French Painters* (New York, 1893).

CONSTAN'TA. See KÜSTENDJE.

CONSTANT DE REBECQUE, kôn'stäN' de re'bĕk', HENRI BENJAMIN (1767–1830). A distinguished French politician and novelist, born at Lausanne, Oct. 23, 1767. His family was Protestant and had taken refuge in Switzerland from religious persecution. Till 13, Constant studied at Lausanne, then successively at Oxford, Erlangen, and Edinburgh, laying the foundations of a cosmopolitan culture that explains his affinity for Madame de Staël. During his stay in England he became imbued with Whig tendencies and a deep admiration for the English system of constitutional monarchy. He was a moderate Republican during the Revolution, and after 1795 settled in Paris, where his political writings, especially his pamphlet, *De la force du gouvernement actuel de la France*, attracted great attention. In 1799 Bonaparte called him to the tribunate, but he opposed the First Consul's attack upon constitutional rights, and was exiled in 1802. His political career thus checked, he turned to literature and accompanied Madame de Staël, like him an exile, on her travels. At Weimar he met and came under the influence of Goethe and Schiller. He translated, or rather adapted, the latter's *Wallenstein*. It was during this period that he entered into his second matrimonial venture, with Charlotte von Hardenberg, his first wife, Baroness Chramm, having divorced him in 1793. He also wrote *Adolphe* (1816), a literary result of his relations to Madame de Staël, who had put her experience with him into *Delphine*. This sole novel of the versatile politician is a clear, keen, relentless analysis of the mutual degradation resulting from ill-assorted matings. It is brief, almost cruelly simple, and told in a style as precise and dry as that of a mathematical demonstration. It is considered as the original model of the psychological novel in France. Chivalrous towards Madame de Staël, he is pitiless to himself, to his father, to his former love, Madame de Charrière, and to their officious friend, Madame Récamier. Constant's *Correspondence*, his *Journals*, all that we know of his life, show him, as he reveals himself here, always seeking emotion, never attaining passion. He repeatedly and consistently fought for his opinions, even when his future and very life were at stake. With this novel still unpublished, he returned to France after Napoleon's first abdication (1814), with the prestige of his stirring pamphlet *De l'esprit de conquête et de l'usurpation* (1813). He expected to find the Restoration more favorable to constitutional liberty than Napoleon's "government of mamelukes," but he was soon undeceived. During the Hundred Days he coöperated with the returned Emperor, and assisted in drawing up the *acte additionel* to the constitution. He was not false to his original principles in this step, for he was actuated by the vain hope that a strong government might be a better guarantee of individual liberty, as in England. After Waterloo he retired to England, but was permitted to return to France in 1816. He joined the liberal writers of the day and was elected deputy in 1819. However, his spirit was somewhat crushed now by Madame de Staël's death and still more so, later on, by his unrequited love for the famous beauty, Madame Récamier. He became the acknowledged leader of the opposition to Charles X, and the most brilliant champion of a constitutional monarchy. He deplored the violence of the revolution of July, which occurred while he was convalescent in the country. At the request of Lafayette he returned, and for the few months that remained to him of life supported the government of Louis Philippe and the principles to which his political life had been dedicated. He died at Pau, Dec. 8, 1830. Constant was not a graceful speaker, but a singularly effective writer. His speeches are collected as *Discours* (2 vols., 1828); his essays on representative government as *Cours de politique constitutionelle* (4 vols., 1817–20). His *De la Liberté des brochures, des pamphlets, et des journaux considérée sous le rapport de l'intérêt du gouvernement* (1814), a most forcible pamphlet on free speech, is undoubtedly one of his best contributions to the progress of human thought. He wrote also *Mémoires sur les Cent Jours* (1820), and *De la religion considérée dans sa source, ses formes, et ses développements* (1824–31), visibly saturated with German mysticism, in which he undertook to show that the religious instinct remained essentially unaffected through all changes of dogma and forms. In teaching that Christianity had "introduced moral and political

liberty into the world," he widened the breach with the thought of the eighteenth century shown and in part caused by the *Génie du Christianisme* of Chateaubriand. "Lucian was incapable of understanding Homer," he said; "Voltaire has never understood the Bible."

Consult: Faguet, *Politiques et moralistes* (Paris, 1898); Sainte-Beuve, *Nouveaux Lundis*, vol. i (Paris, 1863), and *Portraits littéraires*, vol. iii (ib., 1864); *Le cahier rouge de Benjamin Constant* (1907); *Journal intime* (1804–16), ed. by D. Megari (1895); G. Rudler, *La jeunesse de Benjamin Constant* (1900); G. Rudler, *Bibliographie Critique* (1909).

CONSTANTIN, kōn'stäN'täN', Abbé. The lovable, benevolent old parish priest in Ludovic Halévy's graceful romance *L'Abbé Constantin* (1882). A successful comedy under the same title was adapted from the romance by Crémieux and Decourcelle, and presented at the Gymnase in 1887.

CONSTANTINA, kōn'stän-tē'nä. A town of Spain, in the Province of Seville, about 40 miles north-northeast of Seville (Map: Spain, C 4). It is in a mountainous region and has lead mines, lumbering interests, distilleries, and tanneries. Pop., 1900, 9687; 1910, 11,295.

CONSTANTINE, kōn'stän-tēn'. A fortified city and a Catholic episcopal see, the capital of the Department of Constantine, Algeria, 54 miles by rail southwest of Philippeville (Map: Africa, E 1). It is situated on a precipitous hill with a flat summit, two sides of which are washed by the Rummel, flowing through a deep and narrow ravine. It is a natural citadel, 830 feet above the river and 2162 feet above sea level; surrounded by walls which the Arabs made out of Roman sculptured stones. The Moorish or older portion of the town is close and dirty. Its chief ancient buildings are the Kasba, or Roman citadel; the palace of the Bey; the harem of Salah; and three mosques, one of which, Suk-er-Rezel, dating from 1143, is now the Christian church of Notre Dame des Sept Douleurs. The modern or French portion has wide streets and open squares. Its principal buildings are the Palais de Justice, administrative buildings, the Protestant church, and a theatre. A Mohammedan religious seminary, a French government college, and other educational institutions for Arabic and European culture have been founded. The town is a centre of the leather industry and also has manufactures of woolen cloths, saddlery, and a considerable grain trade with Tunis. Its seaport is Philippeville, to the northeast. Constantine, named after the famous Roman Emperor, anciently one of the most important towns of Numidia (Carta of the Carthaginians; Cirta of the Romans), was destroyed in the wars of Maxentius against Alexander, about 311 A.D., but was rebuilt by Constantine the Great in 313. It was a flourishing town in the twelfth century, trading with Venice, Genoa, and Pisa. The French captured it in 1837. Pop., 1901, 48,243, including 15,096 French residents; 1906, 46,806; 1911, 61,413.

CONSTANTINE, kōn'stan-tīn. The name of two popes.—Constantine I (Pope 708–715), a Syrian by birth. His pontificate was marked by the submission of Felix, Archbishop of Ravenna, to the supremacy of Rome, and by his voyage to Constantinople, at the invitation of Justinian II, to confirm the decrees of the Quinisextan Council, which his immediate predecessor had refused to do.—Constantine II (Pope 767–768). He was forced into the see by his brother, Duke Toto of Nepi, but within a few months was overthrown and blinded by an opposing faction, his deposition being solemnly confirmed by the Lateran Synod of 769, which laid down the rule that the Pope must be chosen from the College of Cardinals. On this account his name is often excluded from the list of popes.

CONSTANTINE I, Flavius Valerius Aurelius Constantinus, surnamed "the Great." A Roman Emperor (306–337 A.D.). He was born about 274 A.D., at Naissus, in Mœsia (Servia). He was the eldest son of Constantius Chlorus. He accompanied Diocletian, in that monarch's famous Egyptian expedition (296); subsequently he served under Galerius in the Persian War. In 305 the two emperors, Diocletian and Maximian, abdicated, and were succeeded by Constantius Chlorus and Galerius (q.v.). Galerius, who could not endure the brilliant and energetic genius of Constantine, took every means of exposing him to danger; in this period, it is believed, Constantine acquired that mixture of reserve, cunning, and wisdom which was so conspicuous in his conduct in after years. At last Constantine fled to his father, who ruled in the West, and joined him at Boulogne just as he was setting out on an expedition against the Picts in North Britain. Constantius died at York, July 25, 306, having proclaimed his son Constantine his successor. The latter now wrote a conciliatory letter to Galerius and requested to be acknowledged as Augustus. Galerius did not dare to quarrel with Constantine, yet he granted him the title of Cæsar only. Political complications now increased, and in a short time no fewer than six emperors were "in the field"—Galerius, Licinius, and Maximin in the East, and Maximian, Maxentius (his son), and Constantine in the West (308). Maxentius, having quarreled with his father, forced him to flee from Rome. The latter took refuge with Constantine, but was ungrateful enough to plot the destruction of his benefactor. This being discovered, Maximian fled to Marseilles; its inhabitants gave him up to Constantine, who put him to death (309). Maxentius professed great anger at the death of his father and assembled a large army, with which he threatened Gaul. Crossing the Alps by Mont Cénis, Constantine thrice defeated Maxentius—first near Turin, then under the walls of Verona, and finally near the Milvian Bridge at Rome, Oct. 27, 312; Maxentius himself, in the last of these engagements, was drowned in an attempt to escape across the Tiber. During this campaign Constantine was said to have had the apparition in the sky of a luminous cross with the words, *Ἐν τούτῳ νίκα, En toutō nika* (in Latin, *Hoc vince*, 'By this conquer'), as the contemporary historians Eusebius and Lactantius record. This vision, it is said, spurred him on against Maxentius and made him a Christian. Constantine now entered the capital, disbanded the prætorians, and adopted other judicious measures for allaying the public excitement. He was honored with the title of Pontifex Maximus, or supreme dignitary of the pagan hierarchy.

Constantine was now sole Emperor of the West. Similarly, by the death of Galerius in 311 and of Maximin in 313, Licinius became sole Emperor of the East. In 314 a war broke out between the two rulers, in which Licinius was worsted and was fain to conclude a peace by the cession of Illyricum, Pannonia, and Greece. For

the next nine years Constantine devoted himself vigorously to the correction of abuses in the administration of the laws, to the strengthening of the frontiers, and to chastising the barbarians, who learned to fear and respect his power. In 323 war was renewed with Licinius, who was defeated and ultimately put to death. Constantine was now at the summit of his ambitions—the sole governor of the Roman world; but Rome was no longer the political or geographical centre of this world, and he determined to move the capital to Byzantium, which he solemnly inaugurated in 330 under the name of Constantinopolis, the 'City of Constantine.' A further motive for the removal has been found in the suggestion that Constantine, who had now fully identified himself with Christianity, wished to avoid conflict with the pagan feeling that still was deep-seated at Rome. From Constantinople he ruled his vast empire until his death, which occurred May 27, 337. From the reign of Constantine Christianity was not only recognized and tolerated, but became the religion of the rulers themselves. Of Constantine's personal feeling in the question of Christianity and paganism much has been written. By birth and education he was much inclined towards the growing faith; his mother was a Christian, and his father, Constantius, though a pagan, was very tolerant and would allow no direct acts of violence in his part of the Roman domain during the great persecution of 303. Constantine was by nature mild and kind-hearted; his legislation was governed by humane principles. He abolished the system of branding the faces of convicts; ordained that masters who killed their slaves were guilty of homicide, and published an edict of toleration which insured liberty of conscience throughout the Empire. The Christians were as yet but a minority of the whole population, but the Emperor openly sympathized with them and did not hesitate, upon occasion, to insult the pagans. Yet his Christianity was not deep-seated, though doubtless quite sincere as far as it went. He looked upon his overthrow of Maxentius as due to the help of God, *instinctu divinitatis*, as the inscription on his arch in Rome (see CONSTANTINE, ARCH OF), built in 315, shows; but the very form of expression displays a concession to pagan sensibilities that a rigorous Christian of the period would not have made. He retained the traditional pagan title of Pontifex Maximus, as did his Christian successors of the fourth century, and his coins still bear the figures and the names of the old gods. In the Arian controversy he sided with the Catholic bishops, and it was he who called the great Council of Nicæa (Nice) in Bithynia in 325 (see NICE, COUNCIL OF) and presided at the first sitting. By this council the doctrine of consubstantiality was defined, and the Nicene Creed was adopted. He did not receive baptism until shortly before his death. Consult Firth, *Constantine the Great* (New York, 1905), and *The Cambridge Mediæval History*, vol. i (ib., 1911).

CONSTANTINE I, KING OF GREECE (1868–). He was born in Athens, the eldest son of King George I and Olga, the daughter of the Russian Grand Duke Constantine Nikolayevitch (q.v.) and niece of Czar Nicholas I. He was reared in the Greek Orthodox faith and studied at the universities of Berlin and Leipzig. In 1889 he married Princess Sophia, sister of Emperor William II of Germany. As heir to the throne, he was styled Duke of Sparta and received a careful military training. He was commander in chief of the Greek forces in the brief but disastrous Turkish War of 1897, and for some years subsequently suffered unmerited blame for the military reverses of the Greeks. The agitation against him was carried so far that the Military League compelled him in 1909 temporarily to relinquish his command and retire from the country. In the Balkan War (q.v.), of 1912–13, however, he acquitted himself so well as commander in chief of the Greek armies operating in Macedonia against the Turks that he was hailed as a national hero. His triumphant entry into Saloniki on Nov. 8, 1912, marked his complete conquest of the hearts of his countrymen. His father, while paying a visit to Saloniki, was assassinated on March 18, 1913, and Constantine took the oath at Athens as constitutional King of the Hellenes on March 21. As King, he continued the series of Greek victories by wresting Janina from the Turks and by driving the Bulgarians from Macedonia and the greater part of Thrace, and, as a result of the treaties of London (May 30, 1913) and Bucharest (Aug. 10, 1913), secured sovereignty over an area twice as extensive as his father had ruled. Constantine has five children, of whom the eldest, Prince George (born 1890), is heir apparent. See GREECE, *History*.

CONSTANTINE II, or JUNIOR, FLAVIUS CLAUDIUS CONSTANTINUS. A Roman emperor (337–340 A.D.). He was the eldest son of Constantine the Great, and was born, 317, at Arelate (Arles), in Gaul. He became joint Emperor with his brothers, Constantius and Constans, on the death of their father, in 337, receiving Gaul, Britain, Spain, etc., as his share of the Empire. In 340 he invaded the dominions of Constans and was killed in the battle of Aquileia (340).

CONSTANTINE VII, PORPHYROGENITUS (905–959). A Byzantine emperor. He became, at the age of seven, associate Emperor with his uncle, and at eight sole ruler; but in reality he was the ruler only after the death of his father-in-law, Romanus (q.v.), in 945. Even then he paid more attention to literature than to state affairs. He wrote a life of his grandfather, Basil I, and a number of political works, including *On the Themes*, *On the Ceremonies at the Court of Constantinople*, and *On the Administration of the Empire*. Some of his works are published, in 3 vols., in the Bonn edition of the Byzantine Historians (1829–40). In addition he caused a large number of works to be written for the sake of preserving what was best in the older literature; these included excerpts from the classical authors; encyclopædic collections on history, medicine, and other subjects; and especially the *Basilika*, or collection of laws. He also gave new life to the university at Constantinople. Consult Krumbacher, *Geschichte der byzantinischen Litteratur* (2d ed., Munich, 1897), and Rambaud, *L'Empire grec au Xe siècle; Constantin Porphyrogénète* (Paris, 1870).

CONSTANTINE XI, PALÆOLOGUS (1404–53). The last of the Byzantine emperors. He was the son of the Emperor Manuel II. He had gained possession of Morea and of much of the Peloponnesus and had won many victories over the Turks. In 1446 Murad II defeated him and compelled him to surrender the Peloponnesus. His brother, the Emperor John VIII, died in 1448, and Constantine became Emperor in 1449. He at once went to Constantinople and showed

THE ARCH OF CONSTANTINE

himself an intelligent, brave, and resolute ruler, but his position was a hopeless one. Mohammed II was preparing for the final assault on Constantinople, and Constantine appealed in vain to the princes of Christendom. A long siege preceded the capture of the city, which was finally accomplished May 29, 1453. In the desperate battle waged at the gates of the city Constantine fell, slain by some unknown hand. Consult Mijatovitch, *Constantine, the Last Emperor of the Greeks* (London, 1892), and Pears, *Destruction of the Greek Empire* (ib., 1903). See BYZANTINE EMPIRE.

CONSTANTINE, KONSTANTIN NIKOLAYEVITCH (1827–92). A grand duke of Russia, the second son of Emperor Nicholas I and brother of Alexander II. Having been trained for the navy from early youth, he rose rapidly in rank until he became grand admiral of the Russian fleet and, in addition, held numerous military offices. During the Crimean War he commanded the Russian fleet in the Baltic and directed the defensive preparations which held the English and French armaments in check before Cronstadt. He earnestly supported his brother's liberal reform plans and endeavored in many ways to promote the cause of enlightenment in Russia. He was appointed Governor of Poland in 1862, but failed in his attempts to reconcile the Poles and resigned soon after the outbreak of the revolution in 1863. In January, 1865, he was appointed President of the Council of the Empire. On the accession of his nephew, Alexander III, he was deprived of most of his offices, however, and soon retired altogether from public life, living in retirement in Crimea for the rest of his life.

CONSTANTINE (KONSTANTIN), PAVLOVITCH (1779–1831). A grand duke of Russia, the second son of the Emperor Paul I. He was brought up together with his brother Alexander under the supervision of Catharine II. Having been appointed inspector general of cavalry under Alexander I, he was given command of a division of the Russian army in the Napoleonic campaigns. On the establishment of Polish sovereignty (1815), he was given chief command of the Polish army. After the Congress of Vienna the government of the newly created Kingdom of Poland was intrusted to him by his brother, the Emperor Alexander I. In January, 1822, on his divorce and remarriage out of the ranks of royalty, he executed a private deed by which he resigned his claims to the throne in the event of Alexander's death, and, when that event took place in 1825, he adhered to this resignation, although he had been proclaimed Emperor in the so-called Decembrist uprising. (See RUSSIA.) The succession thus fell to his younger brother Nicholas. The character of Constantine's administration in Poland was not such as to conciliate any class of the people, and a widespread conspiracy was formed. The revolution of July (1830) in France supplied the spark which was needed to kindle the revolution in Poland, and he was obliged to flee for his life. He died soon after of the cholera.

CONSTANTINE, ARCH OF. A famous arch at Rome, between the Palatine and the Cælian hills, southwest of the Coliseum, at the junction of the Sacred and the Triumphal ways. It was erected in 315 A.D., to commemorate the Emperor Constantine's victory over Maxentius. (See CONSTANTINE I.) The arch is the best-preserved monument of ancient Rome, probably because the fact that its builder was a Christian Emperor saved it from destruction during the devastations of the Middle Ages. It has three openings and four columns on each main face. The columns support pedestals, on which were statues of barbarian prisoners, sculptured in the round. Of the reliefs with which the arch is richly decorated, some belong to the time of Constantine; others were taken by Constantine from earlier structures. Consult: Platner, *The Topography and Monuments of Ancient Rome* (New York, 1911); Frothingham, "The Mystery of the Arch of Constantine Unveiled," in the *Century Magazine* for January, 1912; Frothingham, "Who built the Arch of Constantine?" in *American Journal of Archæology*, 2d series, vols. xvi, xvii (1912–13).

CONSTANTINE, BASILICA OF. A vast basilica begun by Maxentius and completed by Constantine I (q.v.), on the site of a former warehouse, at Rome. It had a nave about 250 feet long, with a vaulted roof over 100 feet high and 80 broad. The original entrance faced east, towards the Coliseum. Constantine added a second entrance, facing south, towards the Sacred Way. Thenceforth the basilica gave the same impression of three vaulted parallel halls, whether one entered from the east or from the south. Eight monolithic marble columns adorned the nave; of these only one remains, having been removed in 1613 to the piazza in front of the church of Santa Maria Maggiore. Consult Hülsen-Carter, *The Roman Forum* (Rome, 1906), and Platner, *The Topography and Monuments of Ancient Rome* (New York, 1911).

CONSTANTINE, BATHS OF. Enormous baths built by Constantine, covering nearly the whole breadth of the Quirinal Hill, in Rome. Some remains were seen when the Via Nazionale was built. The baths were demolished by Paul V in 1610, and their site is now occupied by the Quirinal and Rospigliosi palaces. The figures known as the "Horse Tamers," from which Monte Cavallo in Rome is named, stood in front of the baths.

CONSTAN'TINO'PLE (Lat. *Constantinopolis*, from Gk. Κωνσταντίνου πόλις, *Konstantinou polis*, city of Constantine, Turk. *Istambol* or *Stambol*, from Gk. *εἰς τὴν πόλιν, eis tēn polin*, or, in the corrupted dialect of the people, *ἐς τὰμ βόλιν, es tam bolin*, to the city). The capital and largest city of the Ottoman Empire, situated in the extreme eastern part of European Turkey, on a hilly promontory washed by the Sea of Marmora, the Bosporus, and the Golden Horn, a narrow inlet about 4 miles long and from one to 4 miles wide, extending in a northwesterly direction from the Bosporus; lat. 41° N., long. 28° 59′ E. (Map: Balkan Peninsula, G 4). With its many mosques, kiosks, and extensive gardens, it presents from the sea a magnificent appearance, which is greatly enhanced by the natural picturesqueness of the site. The town is divided into quarters in which members of the various creeds segregate. South of the Golden Horn lies Stambol, the Mohammedan centre. It occupies the site of ancient Byzantium. This section is not only the heart of the Turkish Empire, but also of the Islamic world. The suburbs of Galata and Pera are situated on the north and opposite shore of the Golden Horn, which is spanned by two iron pontoon bridges. Stambol is sur-

rounded by partly ruined walls, the most famous of which is the Theodosian double wall dating from 447. The fortifications are flanked by towers and are pierced by numerous historic gates. The streets are crooked and often without sidewalks. There are countless house gardens and many beautiful cemeteries. The houses, usually two-storied, are mostly built of wood, though some portions of the city, since the great fires of 1865, 1866, 1870, and 1909, have been reconstructed in a modern fireproof style.

Constantinople has always been celebrated for the large number and the beauty of its churches. These edifices either belong to the Byzantine period subsequently to which they have been converted into mosques, or else they have been built by the Turks after the city had fallen into their hands. St. Sophia (q.v.) is the most famous church in the first category.

The Suleymanieh Mosque covers a site nearly as large as that of St. Sophia and, like most mosques, is surrounded by a well-shaded court. It was built in 1550–66 by Sultan Suleyman. It has four minarets and is surmounted by a dome somewhat higher than that of St. Sophia. The marble decorations in the interior are magnificent. It is an excellent specimen of genuine Turkish architecture. The Ahmedieh Mosque was built in 1609–14, and exceeds in dimensions the Suleymanieh, but is inferior to the latter in design and in ornamentation. Among other mosques may be mentioned those of Mohammed II, Beyazid II, Selim I, Yeni-Jami, and Nuri-Osmani.

Secular buildings of historic interest are: the Castle of the Seven Towers, once a state prison where a number of dethroned sultans were executed; the hippodrome, completed by Constantine, the scene of public festivals as well as of popular uprisings; and the old seraglio, with its extensive gardens and beautiful kiosks and palaces. This ancient residence of the sultans has been transformed into a museum within which some of the most exquisite creations of the genius of Greek paganism and of Mohammedanism are now stored. South of this museum lies the Sublime Porte. This is the seat of government and consists of an assemblage of administrative buildings. It is surrounded by a railing with several gates. The one facing the ancient palace is very elaborate and was used by the sultans when they went to attend a council of their ministers. It was thus that the name "Bab-Ali," or "Sublime Gate," was applied to it, the French version being now universally used.

The bazars of Constantinople are very numerous. The chief of them, the Grand Bazar, somewhat injured by an earthquake in 1894, occupies a large number of narrow, vaulted alleys and contains about 3000 shops. It is filled with Oriental merchandise of great variety and beauty and affords in daytime one of the finest sights of the city. The bazars, however, are gradually losing their importance, the wealthier classes preferring to make their purchases in the European shops on the Grande Rue in Pera, where modern goods can be obtained.

Galata, situated on the east shore of the Golden Horn, is the business port of Constantinople. Its water front is lined with wharves to which steamers are constantly moored. Here are found the warehouses, banking houses, exchanges, and the customhouse. The town is built of stone, and the streets in some sections are new and regular. The Galata Tower, formerly known as the "Tower of Christ," is 150 feet high and is divided into several stories and surrounded by galleries. It serves as a fire-signal station.

Pera, the foreigners' quarter and the most modern part of Constantinople, lies northwest of Galata. Here are the foreign embassies and the residences of the Europeans. Here also is the Grande Rue, lined with fashionable shops and hotels. Pera has a fine park, barracks, and several cemeteries which are occasionally used as festival grounds.

Administration.—As to government, Constantinople, including the suburb of Scutari across the Bosporus, forms a separate district, under the administration of a prefect. The fire department is being organized gradually according to western systems. Systematic street cleaning is attempted only in the European section of the city. The oldest aqueducts of Constantinople date in part from the reigns of Hadrian and Valens and are regarded among the finest remaining specimens of ancient engineering. Their capacity was increased by the Sultans. Some of the cisterns are the largest in the world; the roof of one of them is supported by 336 marble columns. The water comes from the reservoirs of the forest of Belgrade and also from Lake Derkos.

Numerous elementary public schools are attached to the mosques and offer instruction free; as do also the colleges, or "medresses," some 170 in number, with public libraries attached, many of them filled with valuable books and manuscripts. A university was opened in 1900, with faculties of philosophy, Mussulman theology, mathematics, law, and medicine. The Imperial Art School is not without importance. The two most important educational institutions are the "Lycée Impérial" and Robert College. The last named is an American institution, founded in 1863. The "Great National School" of the Greek dates from the Byzantine period and supplies many teachers for the Greek schools in Turkey. The French conduct several schools for the children of the wealthier classes. Benevolent institutions are numerous.

The industrial importance of Constantinople is not great. The few large establishments manufacture tobacco products, fezzes, and iron wares. The handmade products, on the contrary, are important, both as regards variety and quantity; and to the trade in these small articles the life of the city lends itself most interestingly, with its bursting little shops, its noisy street traffic before the mosques, and its curious and picturesque trade customs. The geographical position and natural harbor facilities of Constantinople are unsurpassed. The Golden Horn affords accommodation for over 1000 vessels of the heaviest draft. It is divided by its two bridges into the outer and inner ports of trade and the port of war.

Not until 1888 did the city have railway connection with the rest of the world. Since the establishment of direct steam communication between Persia, Syria, Arabia, and southern Europe, and the opening up of Central Asia by Russia, Constantinople has lost a considerable part of its commerce. Important imports are food products, textiles, coal, metal ware, instruments and implements of all kinds, petroleum,

and wood. The exports are largely confined to carpets and rugs, lambskins and wool, attar of roses, embroideries, and filigree work. The entrances and clearances of shipping during 1910 comprised 20,268 vessels, with a tonnage of 19,154,000. For local transportation there are omnibuses, horse-car and electric lines. An underground cable road connects Galata and Pera. Small steamers and ferries ply in the Golden Horn between Stambol and Galata. Excellent passenger service between the city proper and the suburbs in the Bosporus is afforded by splendidly equipped ferries.

The population of Constantinople proper is estimated at about 942,000. This figure is increased to over 1,200,000 by including the suburbs. In the city proper nearly two-thirds of the population are Mohammedans.

History.—The city was founded in the sixth century B.C. by Greek adventurers. Owing to the advantages of its site, the settlement prospered rapidly. Its possession was the aim of the leading nations. In 330 A.D. the Roman Emperor Constantine the Great adopted the city as his capital in preference to Rome and gave it the name "Constantinople." The presence of the Emperor made Constantinople from the first distinctively the capital of the Greek civilization in the eastern part of the Roman Empire, as Rome remained the head of the Latin civilization in the West. From 395 to 1453 the city was the capital of the Byzantine or Eastern Empire. The Patriarch of Constantinople gradually rose to the position of head of the Christian Church in the East. In the course of years, as the Imperial provinces in Asia and Africa, with the great metropolises of Antioch and Alexandria, fell into the hands of the Mohammedans, the Christian culture of the East found refuge in Constantinople, and Byzantinism—a blending of the ideas of Oriental despotism with the Roman conception of the state—found its home there. In the struggle between Latin and Greek Christianity Constantinople naturally was the great opponent of Rome, and, as the champion of inflexible orthodoxy, it welcomed the great schism of 1054, which broke up the Catholic church. The strategic position of the city at the meeting place of two continents exposed it to attacks from numerous nations—Avars, Arabs, Bulgars, Varangians, the Latin powers of western Europe, and finally the Turks. It was besieged frequently, and its walls were repeatedly assaulted; but it was taken thrice only—by the Crusaders in 1203 and 1204, and by Mohammed II, after a memorable siege, on May 29, 1453. The prosperity of the city sank during the period of the Crusades, when its lucrative commerce was diverted to the Italian towns. In 1204 it was captured and sacked by the Crusaders, who established the Latin Empire of Constantinople; but this lasted only until 1261, when the Greeks regained the city. Its capture by the Turks marks an epoch in European history. In more recent times Constantinople has been important as a storm centre in the play of international politics known as the "Eastern Question." In 1878 the Russian armies advanced to the fortifications of the city and occupied the suburb of San Stefano. See BALKAN WAR.

Consult: Grosvenor, *Constantinople* (2 vols., Boston, 1895); Van Milligan, *Byzantine Constantinople* (London, 1899); Pears, *Fall of Constantinople* (New York, 1886); *The Destruction of the Greek Empire* (London, 1903); Djelal Essad, *Constantinople, De Byzance à Stamboul* (Paris, 1909); Hutton, *Constantinople* (London, 1904); Dwight, *Constantinople and its Problems* (New York, 1901); Barth, *Konstantinopel* (Leipzig, 1901).

CONSTANTINOPLE, COUNCILS OF. Eight councils which are recognized as ecumenical by either the Greek or Latin church, or by both, were held at the city of Constantinople. The *first* was the second ecumenical council of the Church, convened in 381 by the Emperor Theodosius I. It consisted of 150 bishops, chosen under the dictation of the Emperor and chiefly from the East, besides 36 semi-Arian bishops, followers of Macedonius of Constantinople, who withdrew after their opinions had been condemned. This council condemned also the Arians, Eunomians, and Eudoxians; it reaffirmed the resolutions of the Council of Nice, completed the definition by that council of the divinity of the Holy Ghost, and declared that the Bishop of Constantinople, or new Rome, was, of right, next in rank to the Bishop of old Rome; both of them being alike subject only to the Emperor. The *second* was the fifth ecumenical council of the Church, convened in 553 by Justinian I to sustain his condemnation of three distinguished teachers of the Antiochian school, viz., Theodore of Mopsuestia, Theodoret of Cyprus, and Ibas of Edessa, whose opinions had been collected into "three chapters." (See CHAPTERS, THE THREE.) There were 165 bishops, all Eastern except six, in attendance. They condemned the "three chapters" and renewed the condemnation of the doctrines of Nestorius. Pope Vigilius, though not present, afterward sanctioned the condemnations. The *third* was the sixth ecumenical council, held in 680–81. Through the influence of the Roman legates the council condemned the doctrine that, "as there was only one Christ, so He had only one will," and recognized in Him, consistently with the doctrine of two natures in one person, two wills made one by the moral subordination of the human to the divine. The *fourth* was the council held in 692, by command of Justinian II. It is recognized as ecumenical only by the Greeks, and is called *quinisextum*, because it supplemented the fifth and sixth. It passed more than 100 canons concerning the morals of the clergy and Church discipline. The *fifth* was held in 754, and was attended by 338 bishops. It is recognized only by the Greeks and is called "the Mock Synod" by Hefele. It issued a decree against image worship, which was revoked in 787 by the second ecumenical Council of Nice. The *sixth* was held in 869–870 and is recognized only by the Latin church. It was attended by about 100 bishops. It deposed the Patriarch Photius, restored Ignatius, and enacted laws concerning Church discipline. The *seventh* was held in 879 and is called by the Greeks the eighth ecumenical. There were 383 bishops present. It recalled Photius, repealed the action of the preceding council against him, and defined the position of the Patriarch of Constantinople in relation to the Pope. The *eighth* was held in 1341 and is called by the Greeks the ninth ecumenical. It condemned Barlaam, an educated monk, as heretical in opposing the Hesychasts, a mystical sect among the monks of Mount Athos, who asserted the possibility of attaining, while yet in the

body, an intuition of the divine light and essence by a perfect cessation of corporeal life.

CONSTANTIUS I, kŏn-stăn'shĭ-ŭs, FLAVIUS VALERIUS. A Roman Emperor (305–306 A.D.), commonly known as *Chlorus*. He was adopted as Cæsar in 292 by Maximian and received the government of Gaul. When Diocletian and Maximian abdicated the throne, May 1, 305, Constantius and Galerius became emperors respectively of the West and the East. Constantius died at Eboracum (York), in Britain, July, 306, and was succeeded by his son, Constantine the Great. He was distinguished alike for his intrepidity as a soldier and for his ability and humanity as a ruler. See CONSTANTINE I.

CONSTANTIUS II, FLAVIUS JULIUS. A Roman Emperor (337–361 A.D.). He was, by Fausta, the second son of Constantine the Great, and was born at Sirmium (Illyricum), 317. Constantine made him Cæsar in 333, and in 335 appointed him ruler in the East, where, after 337, he reigned as Emperor. Often involved with the Persians, he suffered at their hands a galling defeat in 348. His brother Constans being murdered by Magnentius, he met the latter in battle at Mursa and punished him so grievously that he subsequently perished by his own hand. Constantius now reigned alone over the whole Empire. He made his cousin, the apostate Julian, Cæsar in Gaul and bestowed upon him the hand of his sister, Helena. When, however, Julian achieved great glory, Constantius became jealous and demanded the relinquishment of many troops. With this order Julian was disposed to comply, but his admiring soldiers refused to leave him. Constantius then proceeded against him, but died of fever before an engagement, whereupon Julian, previously proclaimed, succeeded to the title. As a ruler, Constantius was severe and oppressive. Consult *The Cambridge Mediæval History*, vol. i (New York, 1911).

CON'STANTS OF NATURE. A term applied to various unchangeable quantities that are found to be characteristic of natural phenomena or relations. The propagation of light through space takes place invariably at the rate of 186,770 miles per second, and hence the velocity of light may be referred to as a constant of nature. The period of rotation of the earth on its axis may be considered as another constant of nature, although, strictly speaking, it is subject to slight variation. The atomic weights of chemistry, i.e., the smallest relative combining weights of the elements, furnish another example of important constants of nature —important because they permit of expressing the composition and reactions of all substances in a simple and useful form. The electrolytic equivalents, i.e., the weights of elements deposited in the electrolysis of their compounds by a unit current in one second, are likewise constants characteristic of the several chemical elements.

In choosing the units of precise measurement, which form the basis of all calculations in pure and applied science, it is necessary in certain cases to employ the constant quantities of nature. For example, the second, which is the unit of time generally used at present, is defined in terms of the time of a complete revolution of the earth on its axis. As thus defined, however, the unit is not quite perfect; the time of a revolution of the earth on its axis is subject to slow variation, and hence the duration of the second, referred to that time, must likewise be slowly changing. But, taking the average for a year of the times of rotation of the earth, i.e., obtaining "the mean solar day," it is found that this remains unchanged from year to year so far as is known. Ordinary chronometers and clocks are so rated as to give this time. With a view to establishing a more perfect unit of time, scientists have proposed to adopt as its basal constant of nature the period of vibration of an atom emitting light of a given wave length—an interval of time that is believed to be absolutely constant, provided the conditions of excitation of the light remain unchanged.

The laws of science are generally expressed in the form of mathematical equations whose numbers and terms represent the constant as well as the variable factors of typical natural phenomena. Thus, the variation of volume under variable conditions of temperature and pressure, which is characteristic of all bodies, is in the case of perfect gases subject to laws that are usually expressed by the equation $PV = RMT$ in which P stands for pressure, V for volume, T for the absolute temperature (i.e., $t°$ centigrade + 273), R is a constant for any *one* gas, and M is the mass. If, in experimenting with different gases, we should employ such quantities of them as would, under the same conditions of pressure and temperature, occupy equal volumes,—i.e., if the mass of the gas is numerically equal to the "molecular weight" of the gas,—we would find that while the pressure and temperature might subsequently be changed, the ratio of the product PV to T, i.e., the product $R\varpi$ "molecular weight," would remain constant and the same for all gases, irrespective of their chemical nature; i.e., the product of the pressure and volume (PV), divided by the absolute temperature (T), would yield invariably the same number. That number, called "the gas constant," is therefore obviously characteristic of the interdependence of pressure, volume, and temperature in all gaseous matter; and, being so general, it has great importance in both pure and applied science. Thus, the constants of nature characterize natural phenomena and enter into all the mathematical laws of science.

Consult: Lupton, Everett, *C. G. S. System of Units* (London, 1902); Landolt and Börnstein, *Physikalisch-chemische Tabellen* (4th ed., Berlin, 1912); Clarke, *The Constants of Nature* (5 parts, Smithsonian Miscellaneous Collections, Washington, 1873–88). Some of the constants of nature may of course be found in any scientific textbook. See also CALCULUS; C. G. S. SYSTEM.

CON'STELLA'TION (Lat. *constellatio*, from *com-*, together + *stella*, star, Gk. *δστήρ, astēr*, Skt. *star*, Ar. *stare*, OHG. *sterno, sterro*, Ger. *Stern*, AS., Eng. *star*). A group of stars. From a time earlier than authentic records can trace, the stars have been formed into artificial groups, which have received names borrowed from fancy or fable. These groups are called "constellations." Though quite devoid of anything like systematic arrangement, this traditional grouping is found a sufficiently convenient classification and still remains the basis of nomenclature for the stars among astronomers. Before the invention of almanacs the risings and settings of the constellations were looked to by husbandmen, shepherds, and seafaring men as the great landmarks of the seasons, and consequently of the weather which each season

was expected to bring with it (see Job xxxviii. 31); and it is not surprising if the storms or calm weather that usually accompanied such seasons were connected, in the popular imagination, with the influence of the stars themselves, or the beings with whom superstition or fable identified them. Thus, the risings and settings of Boötes with the bright star Arcturus, which took place near the equinoxes, portended great tempests. (See Vergil's *Georgics*, i, 204.) The great heat in July was ascribed to the rising of Canis Major, the Great Dog, with its bright star Sirius. (See CANICULA; HELIACAL RISING.) The appearance of the twins, Castor and Pollux, was hailed as the harbinger of fair summer weather.

Almost all nations have, from early times, arranged the stars into constellations, but it is chiefly from the nomenclature of the Greeks and Romans that our own is derived. Eudoxus (c.370 B.C.), a contemporary of Plato, gave a description of the face of the heavens, containing the names and characters of all the constellations recognized in his time. Though this production is lost, a poetical paraphrase of it, entitled *Phainomena*, written about a century later by Aratus (q.v.), is still extant. This poem describes 12 zodiacal constellations (see ZODIAC), with 20 situated to the north and 13 to the south of the ecliptic (q.v.). The next enumeration occurs in the *Almagest* of Ptolemy, and includes the preceding, with three additional, one northern and two southern, constellations, making in all 48. The names of these ancient constellations are: north of the ecliptic, *Andromeda, *Aquila, *Auriga, *Boötes, *Cassiopeia, *Cepheus, *Corona Borealis, *Cygnus, Delphinus, *Draco, *Equuleus, *Hercules, *Lyra, *Ophiuchus, *Pegasus, *Perseus, Sagitta, Serpens, Triangulum, *Ursa Major, *Ursa Minor; in the Zodiac, *Aries, *Taurus, *Gemini, *Cancer, *Leo, *Virgo, *Libra, *Scorpio, *Sagittarius, *Capricornus, *Aquarius, *Pisces; south of the ecliptic, Ara, *Argo, *Canis Major, *Canis Minor, *Centaurus, *Cetus, *Corona Australis, Corvus, Crater, *Eridanus, Hydra, Lepus, Lupus, *Orion, Piscis Australis. Large accessions have been made to the nomenclature in modern times partly in consequence of maritime discovery having made us acquainted with constellations in the Southern Hemisphere which never rose upon the world known to our ancient authors, and partly through the subdivision of some of the larger of the ancient constellations into smaller groups. Among those who were chiefly instrumental in forming new constellations may be mentioned Petrus Theodorus (d. 1596), Johann Bayer (1572–1625), Jakob Bartsch (1600–33), Johann Hevel, or Hevelius (1611–87), and Nicolas Louis Lacaille (1713–62). In 1751 Lacaille went to the Cape of Good Hope for the purpose of making a catalogue of the southern stars, and forming them into constellations —an undertaking which he prosecuted with great ardor for nearly four years, at the expense of the French government. In 1840, a committee, consisting of Sir John Herschel, Dr. Whewell, and Francis W. Baily, was appointed by the British Association for the purpose of defining the constellations and settling their boundaries. Largely as a result of their recommendations, 87 constellations are now accepted as authoritative. These include the 48 Ptolemaic constellations: Apus, *Camelopardus, *Chamæleon, Columba, *Coma Berenices, *Crux, Dorado, Grus, Hydrus, Indus, *Monoceros, Musca, Pavo, Phœnix, Piscis Volans, Toucan, and Triangulum Australe, formed by Bartsch and others before the middle of the seventeenth century; *Canes Venatici, Lacerta, Leo Minor, Lynx, *Scutum Sobieski, Sextans, and *Vulpecula, described by Hevelius in 1690; *Antlia, Cœlum, Circinus, Fornax, Horologium, Microscopium, Mensa, Norma, Octans, Pictor, Reticulum, Sculptor, and Telescopium, contributed by Lacaille in 1753; and finally, Carina, Puppis, and Vela, formed by the British Association committee, and replacing the ancient constellation Argo, out of which they were carved. The chief constellations are indicated by an asterisk, and will be noticed under their several names. Early in the seventeenth century, Julius Schiller, the friend of Bayer, attempted to reform the nomenclature of the constellations, replacing the old pagan names by others drawn from Christian sources. Thus, the zodiacal constellations received the names of the twelve Apostles, and Perseus, Hercules, Cassiopeia, Pegasus, Canis Major, Centaurus, and Auriga, became the Apostle Paul, the Three Kings from the East, Mary Magdalen, the Archangel Gabriel, King David, the Patriarch Abraham, and St. Jerome respectively, but the changes failed to meet with acceptance. The fanciful figures from which the constellations are named are depicted on celestial globes and maps of the heavens.

In the older writers upon astrology, constellation signifies the relative positions of the planets at a given moment. See ASPECT.

Consult: Wolf, *Geschichte der Astronomie* (Munich, 1877); Plunket, *Ancient Calendars and Constellations* (London, 1903); Young, *Uranography*, a supplement to *Elements of Astronomy* (New York, 1909).

CONSTELLATION. A famous United States vessel, built in 1798, which, as the flagship of Commodor Truxton, captured the French frigate *Insurgente* in 1799, and in 1800 won a brilliant victory over the superior French frigate *La Vengeance*.

CON'STIPA'TION (Lat. *constipatio*, from *constipare*, to crowd together, from *com-*, together + *stipare*, to crowd, from *stipes*, stem). Abnormal retention in the intestines of fecal matter, or its passage in abnormally hard masses. Normally the bowels of an infant should "move" or be emptied from two to five times in 24 hours; the bowels of an adult once in 24 hours. The causes of constipation are imperfect digestion (due to deficient secretion in the alimentary canal, inaction of the liver, or insufficient contraction of the muscular fibres of the intestine), insufficient exercise, the use of alcohol or drugs, or improper food. Congenital or acquired strictures of the bowel, fibrous bands following intra-abdominal operations or inflammations, lax abdominal walls with a general prolapse of the abdominal contents (enteroptosis), are also frequent causes. Symptoms may be entirely absent, but commonly there are lassitude, dull headache, and mental depression, together with failing appetite and furred tongue. In obstinate cases acute obstruction of the colon may occur, or ulceration of the colon, or even perforation. Hemorrhoids are not an unusual result of chronic constipation. The treatment of constipation may be dietetic, hygienic, and medicinal. The diet should be largely vegetable, with whole-wheat bread, cereals, fruit, and an increase of fats and water, with little

meat, no alcoholic beverages, and little sugar. A daily cold sponge bath, regular out-of-door exercise, and circular massage of the abdomen in the direction of the passage of the intestinal contents, relieve many cases. In other cases enemas or cathartic medicines may be necessary. See CATHARTIC.

Lower Animals. Constipation in the lower animals depends, as in man, on imperfect secretion from, or motion of, the intestinal walls. In the horse it is usually accompanied by colic (q.v.), and when long continued leads to enteritis (q.v.). The appropriate remedies are soap and water clysters, given every two hours; smart friction and cloths wrung out of hot water applied to the abdomen, with three drachms of aloes and one of calomel, given in gruel, and repeated in 16 hours if no effect is produced. Give, besides, walking exercise; restrict the amount of dry solid food, but allow plenty of thin gruel or other fluids, which may be rendered more laxative by admixture with treacle or a little salt. Similar treatment is called for in dogs, cats, and pigs. In cattle and sheep digestion principally takes place in the large and quadrisected stomach; the bowels, accordingly, are little liable to derangement; and constipation, when occurring in these animals, generally depends upon impaction of dry hard food between the leaves of the manyplies, third stomach, or fardel bag. The animal is hence said to be *fardel bound*. The complaint results from the eating of tough and indigestible food, such as ripe vetches, rye grass, or clover; it prevails in dry seasons, and on pastures where the herbage is coarse and the water scarce. It occurs among cattle partaking freely of hedge cuttings or shoots of trees, hence its synonym of *wood evil*. From continuous cramming and want of exercise, it is frequent in stall-feeding animals, while from the drying up of the natural secretions it accompanies most febrile and inflammatory diseases. The milder cases constitute the ordinary form of indigestion in ruminants, are accompanied by what the cow man terms *loss of cud*, and usually yield to a dose of salts given with an ounce or two of ginger. In more protracted cases rumination is suspended, appetite is gone, constipation and fever are present. There is a grunt noticeable especially when the animal is moved, and different from that accompanying chest complaints, by its occurrence at the commencement of expiration. By pressing the closed fist upward and forward beneath the short ribs on the right side, the round, hard, distended stomach may be felt. This condition may continue for 10 days or a fortnight, when the animal, if unrelieved, becomes nauseated and sinks. Stupor sometimes precedes death, while in some seasons and localities most of the bad cases are accompanied by excitement and frenzy. In this, as in other respects, the disease closely corresponds with stomach staggers in the horse. *Treatment.*—Give purgatives in large doses, combining several together, and exhibiting them with stimulants in plenty of fluid: For a medium-sized ox or cow, use three-quarters of a pound each of common and Epsom salts, 10 croton beans, and a drachm of calomel, with three ounces of turpentine, and administer this in half a gallon of water. If no effect is produced in 20 hours, repeat the dose. Withhold all solid food; encourage the animal to drink gruel, soft bran mashes, molasses and water; and give exercise, enemata, and occasional hot fomentations to the belly.

CONSTITUENT ASSEMBLY. See ASSEMBLY, NATIONAL.

CON'STITU'TION (Lat. *constitutio*, a settlement of a controversy; then a decree; from *constituere*, to cause to stand, to establish, from *con-* + *statuere*, to erect, to establish). Formerly used of any law promulgated by sovereign authority. In the Roman Empire the Imperial legislation, decreed and put into effect by the will of the Emperor, was comprehensively described by the term *constitutiones*. These included *rescripts*, or answers to petitions; *mandates*, or instructions to officials, administrative and judicial; *decrees*, or judgments on causes brought before him, directly or on appeal; and *edicts*, or general proclamations. See CIVIL LAW.

So, in early English law, *constitution* signified any statute, though it was not commonly employed except with reference to certain important legislation affecting the relations of the state and the church. Thus, the Constitutions of Clarendon were laws enacted in the reign of Henry II at a Parliament held at Clarendon in 1164, restricting the power of the clergy, limiting the right of appeal to the Pope, and virtually making the King the supreme head of the church in England.

At the present time, however, the term is used in the more restricted sense of the fundamental law of a state, society, or corporation, public or private. More specifically, the constitution of a state or society is the body of legal rules by which it is organized and governed, and which determines its legal relations to other states and societies and to its own members. This constitution may be created by the political or other body whose powers it defines and regulates, or by the individuals composing it and from whom its powers are derived, or it may be the creation of an external authority to which it is subject. Examples of the last form of constitution are afforded by the case of the ordinary private corporation, whose fundamental law is prescribed by the state to which it owes its existence; by municipal corporations, such as cities and villages, which derive their authority from their charters of incorporation and from the municipal law of the state to which they belong; and by subject states, territories, or colonies, whose constitutions are to be looked for in the legislation of the parent or sovereign state. The constitutions of Canada, of Hawaii, of Porto Rico, and to a certain extent that of the Republic of Cuba, belong to this class—the act of the American Congress, under the authority and the limitations of which the Cuban constitution was recently enacted, being in effect a part thereof.

Examples of the second form of fundamental law exist, in the political sphere, in popular constitutions like those of the United States, of the several States of the American Union, of the French Republic, and of Switzerland; and, in the domain of private law, by the rules adopted by the stockholders of corporations and voluntary associations for the conduct of their affairs by their boards of directors and other officers.

The first type of constitution, in which the fundamental law is the creation of the powers wielding the sovereign authority of the state, is to be found in all of the monarchical states of

Europe which have adopted, in whole or in part, a constitutional form of government. The free constitution of England, so popular in character and so largely the product of custom, in a strict legal sense, belongs in this category as clearly as does the government of Russia, which became at least nominally constitutional in 1905 by Imperial decree. To this class also we must refer the constitution of the Roman Empire, as well as of the Republic, and of the free commonwealths of ancient Greece. It is to this form of constitution, because it is alterable by the ordinary legislative authority of the state, that Viscount Bryce applies the term "flexible," while constitutions of the second and third classes, which are superior to the ordinary law-making power and not capable of amendment except by the higher authority which created them, he describes as "rigid" constitutions.

It is obvious that the authority of a self-imposed constitution differs widely from that of a true fundamental law, which underlies the ordinary processes of government and by which a political society has chosen to limit or has been constrained to restrict its governmental agencies. In a legal sense, therefore, the real distinction between constitutions does not turn upon the ease or difficulty with which they can be altered, nor yet upon the fact that the established process for amending a constitutional provision differs from the ordinary processes of legislation, but in the fact that a constitution of the one type is a part of the ordinary law of the land, and that a constitution of the other type is superior to the ordinary law; that in the one case legislation is irresponsible and uncontrollable, while in the other it is controlled by the fundamental law. In a state having a constitution of the one sort, we shall expect to find a court or other independent representative of the sovereign power from which the constitution was derived, which shall protect it from encroachments on the part of the ordinary law-making power; in a state of the other sort, we shall look to see the governing authority of the state unfettered by any external authority—itself the supreme representative of the sovereignty of the state.

Ordinary Constitutions.— The constitution of Great Britain affords the best modern example of the nature and operation of an *ordinary* constitution; that of the United States, the best example of an *extraordinary*, or *supreme*, constitution. The British constitution is an indefinite body of legal rules and principles, partly customary, partly the result of judicial decisions, and partly made up of acts of Parliament. These are nowhere collected in one place, but must be extracted from the whole body of the common and statute law of the realm and from observation of the workings of the government. Any act of Parliament and any judicial decision may modify it, and not infrequently statutes have been passed which have contained both constitutional and ordinary legislation mingled together in one and the same paragraph. Not only is there no authoritative statement of the British constitution to be found, but, from its very nature, no such statement could be made. So much of it depends upon custom and so much is left to time and circumstance that the most precise definition of its terms would be the most misleading. No law, statutory or judicial, has created the cabinet, to which, as the executive committee of the House of Commons, the government of the Empire is at present committed; but whether it is really the cabinet, or a committee of the cabinet, or the Prime Minister, that governs England, is so much a question of personality and of circumstances that it defies answer. So no one can say whether the crown still retains the ancient prerogative of vetoing an act of Parliament. It is commonly assumed that the power is extinct. The only safe statement that could be made, however, would be that the right has not been exercised for nearly 200 years, and that only a grave emergency would justify the sovereign in employing it; and if this should occur, there is no lawful process by which the act, however repugnant to current ideas of government in England, could be declared unconstitutional or deprived of its legal effect. Under such a system the constitution would sanction any governmental act which could be performed without precipitating a revolution.

The latest English writers distinguish between the *law* and the *custom* of the constitution—the former having reference to certain statutory provisions (such as the act settling the succession to the crown, the bill of rights, etc.) which, being laws in the strictest sense of the term and tending to limit the authority of a single branch of the government and not the supremacy of Parliament, are capable of enforcement by the courts; and the latter, to the great body of customary rules and observances which in practice control the working of the government and the distribution of its powers, but are enforced only by public opinion and by respect for the settled order of the constitution. The latter are not true laws, as they lack the sanction of any legal authority to declare and enforce them. In the field of ordinary jurisprudence no such distinction as this can be drawn between custom and law. There custom *is* law and will be enforced as such. But the case is manifestly different in the sphere of constitutional law, for there a custom tending to restrict the action of the sovereign power can find no jurisdiction to enforce it.

A constitution of the ordinary legal type may belong to either of the two old categories of "written" and "unwritten" constitutions—an unwritten constitution being one which is wholly or largely based on custom or judicial decisions, and a written constitution being the result of a specific act of legislation and having the definite form and the certainty of a body of statute law. But the distinction, though sound enough, is of no practical importance, as no considerations of political philosophy or of legal validity are involved in it. In fact, every political constitution is a composite of common and statute law, of custom and legislation, and the validity of its several provisions is not in the least dependent upon the manner in which the principles which they embody have acquired the form and content of legal authority. The British constitution, e.g., is much more than a body of customary law. At least five important sources of the rules and principles which it embodies may be distinguished. These are: 1. Two principal treaties, the Act of Union with Scotland in 1707 and the Act of Union with Ireland in 1800. 2. Certain great "compacts," viz., Magna Charta in 1215, the Declaration of Right in 1689, and the Act of Settlement in 1701. 3. A large number of public acts of Parliament, ranging from matters of the greatest

to those of the least political importance. 4. The body of precedents and customs known as the common law. 5. The usages and practices known specifically as the customs of the constitution, which are in reality the mass of practical expedients and understandings by which government is mainly carried on. To these last we have denied the character of law, partly because of their indefiniteness and fluctuation, but more particularly because of their lack of a legal sanction. The fourth class consists of legal rules in the proper sense of the term, but of the sort contemplated by the use of the word "unwritten"; but nevertheless, if formal treaties and acts of Parliament are written law, then is the British constitution, in part at least, a written constitution. Some constitutions of the ordinary type, however, are of the strictly "written" sort, being the result of a single legislative act or a grant of power from the sovereign head of the state. Most of the constitutions which have been promulgated in the several states of continental Europe, as well as that of Japan, are of this character. They have the common characteristic of the lack of any superior sanction. A law enacted by the ordinary legislative authority and promulgated by the supreme executive power of the state is a law, whether sanctioned by the constitution or not. In other words, a law may be unconstitutional and yet valid.

Extraordinary Constitutions.—As the polity of the British Empire furnishes the best example of the ordinary, "flexible," and unwritten constitution, so does the fundamental law of the United States exhibit the best and most characteristic constitution of the opposite type —of the extraordinary, or supreme, and "rigid" form. Though the constitutions of the general government and of the several States have very great and even fundamental differences, they are all alike in this respect, that the organic law has a sanction superior to that of the ordinary law of the land; that the Constitution is in fact "the supreme law" to which the ordinary law must conform; that the sovereignty is not wholly committed to the ordinary agencies of government, but the power of these is limited, and that this limitation on legislative and executive action is not a mere form of words, but is rendered effective by the power vested in the courts of annulling acts of government in contravention of the supreme law. The Federal government and the governments of the States are, therefore, not sovereign, but legally limited corporations, strictly analogous to private and minor municipal corporations, which derive a limited authority from the State which created them. There is nothing singular in the power exercised by the courts in declaring a corporate act invalid because of its transcending the legal authority of the body performing it, even in the political sphere. It is plain that the political action of a colony, even of the "self-governing" type, and of dependent States, as well as of cities and towns, is subject to control by the dominant political authority. The British Parliament and the English courts exercised this authority over the American Colonies as they now exercise it over Canada, Australia, and South Africa. The novelty of the American system consists in the application of this familiar principle to independent and sovereign States. The right of the Supreme Court of the United States, and even of the ordinary Federal tribunals, to pass upon the validity of acts of the national Congress was long disputed, but it was asserted by the Supreme Court as early as 1797, and actually exercised in the celebrated case of Marbury *v.* Madison in 1803. This conclusion was so plainly sound, and so obviously necessary to the working of the American constitutional scheme, that it has been generally acquiesced in. Several of the State courts had in the meantime reached a similar decision as to their authority to nullify acts of their own legislatures when in conflict with the local constitution or with that of the United States, and the principle may now be regarded as an essential part of the constitutional system of the United States. See SUPREME COURT OF THE UNITED STATES.

There is one important difference between the fundamental law of the United States and that of the several States. The national government being a federal union of independent commonwealths—some of them existing before its formation and others having come into the Union as independent States—the national Constitution is simply a grant of powers from the latter to the former, while the State constitutions are merely limitations upon the power of the ordinary agencies of government of the States. From this it follows that the Federal government has no powers excepting such as are conferred by the Constitution to which it owes its existence, while the State governments, on the contrary, have vested in them the full sovereignty of the commonwealth, excepting as this is limited by the local constitution and that of the United States. The function of the courts of the United States and of the several States in interpreting their respective constitutions is very different therefore. An act of Congress is invalid if it transcends the powers conferred upon the legislative branch of the government by the fundamental law; whereas, an act of the Legislature can be impeached for unconstitutionality only if it is in contravention of the limits placed by the Constitution on legislative power.

In general, constitutions may be amended, altered, or abrogated by the same power which created them, or by a process provided in the fundamental law for that purpose. A constitution which is the free gift of the sovereign authority may be recalled or nullified by the authority that conferred it. A rigid constitution of the American type, which is the creation of the people, and which cannot be directly changed without their concurrence, has in practice been found to be of the most inflexible kind. For a period of more than 60 years after the adoption in 1803 of the Twelfth Amendment (relative to the election of President and Vice President) the Constitution of the United States did not suffer a single amendment, and the three amendments adopted at the close of the Civil War, and as the result thereof, and the two recent amendments (1913) empowering the Congress to enact an income tax and providing for the election of United States Senators by popular vote, have been the only changes which it has since sustained. Like the English constitution, however, it has changed greatly, though imperceptibly, by the insidious processes of custom and of judicial interpretation. The history and language of the instrument, and the nature of the changes which it has undergone, will be set forth in the article on the CONSTITUTION OF

THE UNITED STATES. See also GOVERNMENT; STATE; SOVEREIGNTY; GREAT BRITAIN; and the titles of other States concerning whose constitutions information is sought.

CONSTITUTION, CHEMICAL. See CHEMISTRY; CARBON COMPOUNDS; STEREOCHEMISTRY.

CONSTITUTION, THE. A 44-gun frigate, the most famous vessel in the history of the United States navy, sometimes called "Old Ironsides," from the hardness of her planking and timbers. She was launched on Oct. 21, 1797, but was not completed and equipped until the following year, when she put to sea under Captain Nicholson for service against the French. During the war with Tripoli, 1801–05 (see BARBARY POWERS, WARS WITH), she was Preble's flagship and in 1805 took part in three of the five bombardments of the port of Tripoli. In July, 1812, in command of Isaac Hull (q.v.), she escaped from a British squadron off the New Jersey coast, after a spirited chase of three days, and on August 19, off Cape Race, fought her famous battle with the *Guerrière*, Captain Dacres, a somewhat weaker English frigate, which she left a total wreck after an engagement of 30 minutes, the English losing 79 of their crew, the Americans 14. On December 29, under the command of Captain Bainbridge, she captured off Bahía, Brazil, the *Java* (38 guns, Captain Lambert), after a two hours' engagement, in which the British lost 300 in killed and wounded, the Americans 34. On Feb. 14, 1814, under Captain Stewart, she captured the *Picton*, 16 guns, and a convoy, in the West Indies; and on Feb. 20, 1815, she took the *Cyane*, 34 guns, and the *Levant*, 18 guns, after a fierce engagement—remarkable for the seamanship of the Americans and the gallantry of the English—between the Madeira Islands and Gibraltar. The English lost 19 killed and 42 wounded out of 320; the Americans, 6 killed and 9 wounded out of 451. Soon afterward the *Constitution* was closely pursued by a British squadron, which recaptured the *Levant*. Reported unseaworthy between 1828 and 1830, she was ordered to be dismantled, but was retained in deference to the popular sentiment aroused by Holmes's poem "Old Ironsides" and in 1833 was rebuilt. She went out of commission in 1855 at Portsmouth, N. H., was subsequently used as a training ship, was again partially rebuilt in 1877, crossed the Atlantic for the last time in 1878, and was stored at the Boston Navy Yard in 1897. Consult: Hollis, *The Frigate Constitution* (Boston, 1900); Roosevelt, *The Naval War of 1812* (New York, 1882); Barnes, *Naval Actions of the War of 1812* (ib., 1896).

CON'STITU'TIONAL LAW. In general, that branch of public law which deals with the nature and organization of government, the distribution and mode of exercising the sovereign powers of the state, and the relations of the government to those who are subject to its authority. It has nothing to do with the regulation of the external relations of a state with other states, these being governed by international law, though the agencies for maintaining those relations, and the determination of their character and form, may be included within the constitutional law of the state. Thus, the choice of ambassadors, as well as their rank and functions, being the direct concern of the state they are chosen to represent, is governed by its constitutional law, and so, in the United States, is the power exercised by the Senate in approving, amending, or rejecting treaties with foreign powers.

Again, where the states are not related to one another as independent political communities, but sustain a relation of superior and dependent states, as of a colony to the parent state, or a subject to a dominant state, or of a member of a federation of states to the central authority, such relations are matters not of international, but of constitutional law. Thus, the Acts of Union of England with Scotland and Ireland, the acts of the British Parliament incorporating the Dominion of Canada, the Commonwealth of Australia, and the South African Confederation, the various acts of Congress providing for the government of Porto Rico, Hawaii, and the several Territories of the United States, the provisions of the American Constitution determining the relations between the general government and the individual States—all these are as much a part of the constitutional law of the states affected by them as are their bills of rights, or the laws and customs determining the powers of their respective legislatures.

On the other hand, two political communities may be for some purposes constitutionally related and may yet in some respects remain foreign to one another. Thus, while the relations of the several States of the American commonwealth to the central authority, and, through that authority to one another, are governed by their constitutional law, they are yet for many purposes independent of one another, and, in so far as they are independent, their relations are matters of international and not of constitutional law.

Specifically, the constitutional law of a state consists of its constitution, or so much of it as is legally effective, together with the constructions and interpretations which it has received at the hands of the courts or other competent authority.

British Constitutional Law.—Under a flexible constitution like that of England, which is mainly the result of the accumulated experience of centuries, the principal function of constitutional law is to discriminate between those portions of the constitution which are law, in the strict sense of the term, i.e., which have a legal sanction and will be declared by the courts, and those that rest only upon the customs of the community and upon considerations of practical expediency. These last, which are known as the "custom of the constitution," may have a moral sanction which makes them for the time being as effective politically as the law

of the constitution. But, being legally ineffective, i.e., unenforceable by the authority of the state, they do not, strictly speaking, belong in the category of constitutional law. As a considerable part of the British constitution is made up of such customs and practical expedients, the range of law comprised within it is comparatively narrow. It is to be remembered, however, that though custom, in and by itself considered, is not a part of constitutional law, it may become a source of such law by being adopted by the courts and declared in judicial decisions. More than one of the so-called liberties of the subject in England have thus arisen and now form part of the common law of the land. It is to be observed, also, that in Great Britain constitutional law does not exist as a separate and distinct body of rules and precedents, its provisions being an integral part of the common and statute law of the realm, from which they are to be collected.

American Constitutional Law.—In a state which has a constitution of the "fixed" or statutory type, like the United States, much less is left to convention and understanding, and much less depends upon custom and expediency. The area of law under such a constitution is, therefore, much wider, while the task of the constitutional lawyer is much simpler. The constitutional law of such a state consists of the terms of the constitution itself, with the amendments thereto, and the judicial decisions in which its provisions have come up for construction and application. No acts of the legislature declaring the rights of the citizen, no treaty with a foreign government, no abdication of power by any arm of the state, enters into it. In the American system the only authoritative exposition of a constitution is that furnished by the courts. This extraordinary jurisdiction is not confined to the Supreme Court, but is exercised as well by the inferior Federal courts and by the regular tribunals of the several States. As constitutional law, the judgments of these courts vary according to the constitution whose provisions are under examination. The Supreme Court of the United States is the final authority on the Federal Constitution, and the supreme appellate courts of the several States on the constitutions of their respective States.

It will be borne in mind that the judicial power in the United States extends to acts of Congress and of the legislatures, the Constitution being the supreme law to which all legislation must conform; whereas, the British constitution not being a supreme law, but a part of the ordinary law of the land, the powers of Parliament are not and cannot be limited by it. Accordingly judicial decisions upon the legislative power and its limitations, which constitute the bulk of constitutional law in the United States, are wholly unknown in England.

This, indeed, is the leading principle of American constitutional law—that all acts of government, whether legislative, judicial, or administrative, made or done in contravention of the Constitution, are void. This principle is equally applicable to the constitutions of the several States and to that of the United States. But, the Federal government being one of strictly limited powers, a still more stringent principle is applied to test the validity of its acts, viz., that they are void if not specially sanctioned by the fundamental law. But it does not lie within the competence of the courts to control the action of the State on any other principles than such as are laid down in the fundamental law. They cannot declare void an act within the general competence of the legislative powers, merely because it is contrary to natural justice, or because it violates fundamental principles of republican government, or because of a supposed conflict with the general spirit of the Constitution. It should be added that an act adjudged to be unconstitutional is held to have been void and without legal validity from the time of its enactment.

In the article CONSTITUTION OF THE UNITED STATES (q.v.) reference is made to certain changes which the Constitution of the United States has undergone as the result of judicial interpretation and the slow growth of custom. The former of these is clearly a part of constitutional law, but it is not easy to say how far a particular custom, if threatened with violation, would be supported by the courts. It seems probable, however, that the Supreme Court would not hesitate to recognize a well-established practice of the government as a part of the constitutional law of the land. If, e.g., a presidential elector should at the present time assert his right to disregard the instructions under which he was chosen and cast his vote for the candidate of the opposing party, there is at least a question whether he could not be restrained by the courts from carrying his intention into effect. Consult: Boutmy, *The English Constitution* (London and New York, 1891); Story, *Commentaries on the Constitution of the United States* (5th ed., Boston, 1891); McClain, *Constitutional Law in the United States* (New York, 1905). See CONSTITUTION OF THE UNITED STATES; LAW; PUBLIC LAW.

CONSTITUTIONAL UNION PARTY. A party, formed chiefly out of the remnants of the Know-Nothing and Whig parties, which met in convention at Baltimore in May, 1860, and nominated John Bell (q.v.) and Edward Everett (q.v.) for President and Vice President, respectively, of the United States of America, on a platform which declared simply for "the Constitution of the country, the union of the States, and the enforcement of the laws." The party carried Virginia, Kentucky, and Tennessee, and cast a popular vote of about 600,000, and an electoral vote of 39, in the ensuing election. After this campaign the party virtually went out of existence. It was also known as the "Bell-Everett party."

CONSTITUTION OF ATHENS. The title of a work by Aristotle (q.v.).

CONSTITUTION OF MATTER. See MATTER, PROPERTIES OF.

CONSTITUTION OF THE UNITED STATES. The Federal Constitution of the United States of America is one of the class of "written" and "rigid" constitutions, and the most important example of a constitution of the "supreme" or "extraordinary" type. That is to say, it is not only the result of a definite purpose and of a deliberate act of legislation, embodied in written form; it is not only incapable of modification by ordinary legislative processes; but it is the true supreme law of the land, to which all other law must conform, and conformity to it is the test of the validity of the ordinary law. The commanding quality of the Federal Constitution is the fact that it is not,

like most political constitutions, including those of the several States of the American Union, a mere restriction upon the authority of the governing powers of the state, but that it creates a new frame of government, which it endows with certain limited powers, and from which it deliberately withholds all powers not so granted. The government so constituted by it is, therefore, a government of granted, and not of antecedent, authority, and the Constitution is not only the supreme law of the land, but comprehends within itself the whole of that law.

There is some confusion, therefore, in the use of such phrases as the "territorial extent," "the Constitution follows the flag," and whether the Constitution "applies" to certain newly acquired Territories. Strictly speaking, the Constitution has no territorial extension; it neither expands nor contracts with the limits of American jurisdiction; but, whatever those limits may be, it steadily and invariably binds the governmental agencies of the nation and limits their authority. In so far as it confers general powers of government on the President and Congress, those powers may be exercised in the ends of the earth as well as within the limits of the original States; whereas the restrictions upon that power are equally valid wherever it may be exercised.

This view of the Federal Constitution as a carefully guarded grant of powers to the central government, explains even those guarantees of personal liberty and security which it contains and which are commonly referred to as the Bill of Rights of the Constitution (Amendments I–X). These are not, as they are commonly understood, an unlimited charter of liberties for the people of the United States, but only restrictions upon the exercise of arbitrary power by the President and Congress. They are not aimed at the States or at local authority. It is announced as "a settled rule of construction of the national Constitution, that the limitations it imposes upon the powers of government are in all cases to be understood as limitations upon the government of the Union only, except where the States are expressly mentioned" (Cooley, *Constitutional Limitations*, p. 19). Accordingly, even such a right as that of trial by jury in criminal cases, which is usually regarded as one of the inalienable rights of the American citizen, is by the Federal Constitution protected only against violation by Congress and the Federal judiciary. Excepting as they are restrained by their own constitutions, there is nothing to prevent the several States from abolishing the jury system entirely.

From what has been said above, it will be observed that the Constitution of the United States is not, as it is conceived by foreigners, a complete scheme of government for the people of the United States, but only a part, and that the smaller part, of such a scheme. To fill out the outline, the constitutions and laws of the several States must be taken into account. These provide by far the greater part of the machinery of government, the securities of life, liberty, and property, and the political rights of the citizen.

The Constitution of the United States, in the form in which it is reprinted in this article, represents a long process of experiment and discussion, in the course of which the jealousies and conflicting interests of the different States and sections of which the Union was made up, were gradually compromised and subordinated to the common welfare of all. The Articles of Confederation, by which the ill-jointed union of the 13 original States was held together from 1779 to 1789, can scarcely be described as a constitution, in any proper sense of that term, as they created only the form and not the substance of government, and vested no real authority in the common representatives of the several commonwealths. They were more in the nature of a treaty of alliance, by which the States bound themselves to common action and under which the Congress constituted an international conference for promoting the common welfare. The inconveniences and dangers of this arrangement soon became too pressing to be ignored, and in February, 1787, Congress took such action as its limited powers permitted and passed a resolution, suggesting that a convention of delegates from the several States be held at Philadelphia on the second Monday of May following, "for the sole and express purpose of revising the Articles of Confederation, and reporting to Congress and the several State legislatures such alterations and provisions therein as shall, when agreed to by Congress and confirmed by the States, render the Federal Constitution adequate to the exigencies of government, and the preservation of the Union."

Pursuant to this resolution of Congress, delegates from 12 of the 13 States (Rhode Island alone being unrepresented) assembled at Philadelphia, the convention opening its sessions in Independence Hall on May 14, 1787, under the presidency of George Washington. For four months the delegates carried on the great work which had been intrusted to them, and at the close of their deliberations, on Sept. 17, 1787, they had completed the Constitution of the United States, with the exception of the amendments, in the form in which we have it to-day. Their work was promptly approved by Congress, and at the close of the year 1788 had been adopted by 11 of the States and went into operation among them. The two remaining States, North Carolina and Rhode Island, ratified it and entered into the American Union in 1789 and 1790, respectively.

These results were not achieved without difficulty—in the face of profound differences of opinion. In most of the States the ratification of the Constitution was secured by narrow majorities and after prolonged and earnest discussion, and in none of the States was it approved with anything approaching unanimity. This opposition and these differences of opinion were primarily due to what have been called "the compromises of the Constitution." These were three in number. The first dealt with the fundamental conflict between those who desired a strong central authority and those who feared the extension of executive power. This was compromised by investing the President of the Republic with great powers, but for a limited term only, and by a complicated system of "checks and balances," whereby the exercise of his power was at divers points and in various ways subjected to the control of Congress or of the Senate.

The second compromise was of the conflict of the great and small States, the former claiming the weight in the national government to which their size, wealth, and population entitled them, and the latter insisting upon the recognition of their equality as independent, self-governing commonwealths. This was effected by the institution of two chambers of legislation—a Sen-

ate, in which the States were to have equal representation, and a House of Representatives, in which the representation should be in proportion to population. This compromise involved also the delicate question of the distribution of power between the two houses of Congress.

The third compromise was of the controversy between the upholders of slavery and those who believed that slavery should be restricted or abolished. This was adjusted by the proviso forbidding Congress to prohibit the importation or migration of slaves before the year 1808 (Art. I, Sec. 9), and the requirement that fugitive slaves should be delivered up by the States in which they had taken refuge (Art. IV, Sec. 2). As no power was conferred upon Congress or the President to interfere with slavery in the States in which it existed, the institution was left within the complete control of those States.

In some of the States great dissatisfaction was expressed at the absence of anything like a Bill of Rights in the Constitution, and for a time the fear was felt that certain of the States might refuse to ratify unless the Constitution were amended. Accordingly the first Congress after the adoption of the Constitution proposed a series of amendments, which were promptly ratified by the States as Articles I–X of the amendments as they now stand. (See RIGHTS, BILL OF.) Articles XI and XII speedily followed, in 1793 and 1803, respectively. From that date to the Civil War, no amendments to the original instrument were adopted. The next three amendments, Articles XIII, XIV, and XV, were adopted in 1865, 1868, and 1870, respectively, as a part of the reconstruction policy of the government after the Civil War, in order to secure to the lately emancipated slaves the legal and political benefits of full citizenship in the United States and in the several States, and the last two, Articles XVI and XVII, in 1913, as the long result of the democratic movement of the new century. See RIGHTS, CIVIL; CIVIL WAR; RECONSTRUCTION; SLAVERY.

It remains to be said, in conclusion, that, in speaking of the constitution of a State, reference is made to the whole body of its fundamental law, whether embodied in written form or not. The constitution of every active political community is the product of many agencies and influences, not merely of deliberate legislative action. That of the United States is no exception to this rule. The Constitution, as adopted in the early formative period of the Republic, and formally amended from time to time in the manner therein prescribed, has been more extensively amended by the insensible processes of use and custom and by the far-reaching effects of judicial construction. As to the last, it may be said that the Constitution, in setting up a supreme judicial tribunal, with the function of passing upon the validity of national and State legislative action and of executive action, has indirectly provided for a process of amendment much more efficacious than that directly provided. The Constitution of the United States, as it exists to-day, therefore, must be looked for in the decisions of the courts and in the political practice of the people, as well as in the text of the original articles and their formal amendments. The leading authorities on the Constitution are: *The Federalist; Elliott's Debates in Convention on the Adoption of the Federal Constitution;* Curtis, *History, Origin, Formation, and Adoption of the Constitution of the United States;* Story, *Commentaries on the Constitution of the United States;* Cooley, *Treatise on the Constitutional Limitations which Rest upon the Legislative Powers of the States;* Von Holst, *Constitutional Law of the United States of America* (Chicago, 1887); De Tocqueville, *Democracy in America* (London, 1835); Bryce, *The American Commonwealth* (4th ed., 1913), and the *Cases on Constitutional Law of the United States,* collected and edited by J. B. Thayer (Cambridge, Mass., 1894–95). See also CONSTITUTION; CONSTITUTIONAL LAW; SUPREME COURT OF THE UNITED STATES. The text of the Constitution is as follows:

CONSTITUTION OF THE UNITED STATES

We, the people of the United States, in order to form a more perfect union, establish justice, insure domestic tranquillity, provide for the common defense, promote the general welfare, and secure the blessings of liberty to ourselves and our posterity, do ordain and establish this Constitution for the United States of America.

ARTICLE I, Sec. 1. All legislative powers herein granted shall be vested in a Congress of the United States, which shall consist of a Senate and House of Representatives.

Sec. 2. The House of Representatives shall be composed of members chosen every second year by the people of the several States, and the electors in each State shall have the qualifications requisite for electors of the most numerous branch of the State Legislature.

No person shall be a Representative who shall not have attained to the age of 25 years, and been seven years a citizen of the United States, and who shall not, when elected, be an inhabitant of that State in which he shall be chosen.

Representatives and direct taxes shall be apportioned among the several States which may be included within this Union according to their respective numbers, which shall be determined by adding to the whole number of free persons, including those bound to service for a term of years, and excluding Indians not taxed, three-fifths of all other persons. The actual enumeration shall be made within three years after the first meeting of the Congress of the United States, and within every subsequent term of ten years, in such manner as they shall by law direct. The number of Representatives shall not exceed one for every thirty thousand, but each State shall have at least one Representative; and until such enumeration shall be made, the State of New Hampshire shall be entitled to choose 3; Massachusetts, 8; Rhode Island and Providence Plantations, 1; Connecticut, 5; New York, 6; New Jersey, 4; Pennsylvania, 8; Delaware, 1; Maryland, 6; Virginia, 10; North Carolina, 5; South Carolina, 5; and Georgia, 3.

When vacancies happen in the representation from any State, the executive authority thereof shall issue writs of election to fill such vacancies.

The House of Representatives shall choose their Speaker and other officers; and shall have the sole power of impeachment.

Sec. 3. The Senate of the United States shall be composed of two Senators from each State, chosen by the legislature thereof, for six years; and each Senator shall have one vote.

Immediately after they shall be assembled in consequence of the first election, they shall be

divided as equally as may be into three classes. The seats of the Senators of the first class shall be vacated at the expiration of the second year, of the second class at the expiration of the fourth year, and of the third class at the expiration of the sixth year, so that one-third may be chosen every second year; and if vacancies happen by resignation, or otherwise, during the recess of the legislature of any State, the Executive thereof may make temporary appointments until the next meeting of the legislature, which shall then fill such vacancies.

No person shall be a Senator who shall not have attained to the age of thirty years, and been nine years a citizen of the United States, and who shall not, when elected, be an inhabitant of that State for which he shall be chosen.

The Vice President of the United States shall also be president of the Senate, but shall have no vote, unless they be equally divided.

The Senate shall choose their other officers, and also a president *pro tempore*, in the absence of the Vice President, or when he shall exercise the office of President of the United States.

The Senate shall have the sole power to try all impeachments; when sitting for that purpose, they shall be on oath or affirmation. When the President of the United States is tried, the Chief Justice shall preside; and no person shall be convicted without the concurrence of two-thirds of the members present.

Judgment in cases of impeachment shall not extend further than to removal from office, and disqualification to hold and enjoy any office of honor, trust, or profit under the United States; but the party convicted shall nevertheless be liable and subject to indictment, trial, judgment, and punishment, according to law.

Sec. 4. The times, places, and manner of holding elections for Senators and Representatives shall be prescribed in each State by the legislature thereof; but the Congress may at any time, by law, make or alter such regulations, except as to the places of choosing Senators.

The Congress shall assemble at least once in every year, and such meeting shall be on the first Monday in December, unless they shall, by law, appoint a different day.

Sec. 5. Each House shall be the judge of the elections, returns, and qualifications of its own members, and a majority of each shall constitute a quorum to do business; but a smaller number may adjourn from day to day, and may be authorized to compel the attendance of absent members, in such manner and under such penalties as each House may provide.

Each House may determine the rules of its proceedings, punish its members for disorderly behavior, and, with the concurrence of two-thirds, expel a member.

Each House shall keep a journal of its proceedings and from time to time publish the same, excepting such parts as may in their judgment require secrecy, and the yeas and nays of the members of either House on any question shall, at the desire of one-fifth of those present, be entered on the journal.

Neither House, during the sessions of Congress, shall, without the consent of the other, adjourn for more than three days, nor to any other place than that in which the two Houses shall be sitting.

Sec. 6. The Senators and Representatives shall receive a compensation for their services, to be ascertained by law, and paid out of the treasury of the United States. They shall in all cases, except treason, felony, and breach of the peace, be privileged from arrest during their attendance at the sessions of their respective Houses, and in going to and returning from the same; and for any speech or debate in either House they shall not be questioned in any other place.

No Senator or Representative shall, during the time for which he was elected, be appointed to any civil office under the authority of the United States, which shall have been created, or the emoluments whereof shall have been increased during such time; and no person holding any office under the United States shall be a member of either House during his continuance in office.

Sec. 7. All bills for raising revenue shall originate in the House of Representatives; but the Senate may propose or concur with amendments, as on other bills.

Every bill which shall have passed the House of Representatives and the Senate shall, before it become a law, be presented to the President of the United States; if he approve, he shall sign it; but if not, he shall return it, with his objections, to that House in which it shall have originated, who shall enter the objections at large on their journal, and proceed to reconsider it. If after such reconsideration two-thirds of that House shall agree to pass the bill, it shall be sent, together with the objections, to the other House, by which it shall likewise be reconsidered; and if approved by two-thirds of that House, it shall become a law. But in all such cases the votes of both Houses shall be determined by yeas and nays, and the names of the persons voting for and against the bill shall be entered on the journal of each House respectively. If any bill shall not be returned by the President within ten days (Sunday excepted) after it shall have been presented to him, the same shall be a law in like manner as if he had signed it, unless the Congress by their adjournment prevent its return; in which case it shall not be a law.

Every order, resolution, or vote to which the concurrence of the Senate and the House of Representatives may be necessary (except on a question of adjournment) shall be presented to the President of the United States; and before the same shall take effect, shall be approved by him, or, being disapproved by him, shall be repassed by two-thirds of the Senate and House of Representatives, according to the rules and limitations prescribed in the case of a bill.

Sec. 8. The Congress shall have power

To lay and collect taxes, duties, imposts, and excises, to pay the debts and provide for the common defense and general welfare of the United States; but all duties, imposts, and excises shall be uniform throughout the United States;

To borrow money on the credit of the United States;

To regulate commerce with foreign nations, and among the several States, and with the Indian tribes;

To establish an uniform rule of naturalization, and uniform laws on the subject of bankruptcies throughout the United States;

To coin money, regulate the value thereof, and of foreign coin, and fix the standard of weights and measures;

To provide for the punishment of counterfeiting the securities and current coin of the United States;

To establish post offices and post roads;

To promote the progress of science and useful arts, by securing for limited times, to authors and inventors, the exclusive right to their respective writings and discoveries;

To constitute tribunals inferior to the Supreme Court;

To define and punish piracies and felonies committed on the high seas, and offenses against the law of nations;

To declare war, grant letters of marque and reprisal, and make rules concerning captures on land and water;

To raise and support armies, but no appropriation of money to that use shall be for a longer term than two years;

To provide and maintain a navy;

To make rules for the government and regulation of the land and naval forces;

To provide for calling forth the militia to execute the laws of the Union, suppress insurrections, and repel invasions;

To provide for organizing, arming, and disciplining the militia, and for governing such part of them as may be employed in the service of the United States, reserving to the States respectively the appointment of the officers, and the authority of training the militia according to the discipline prescribed by Congress;

To exercise exclusive legislation in all cases whatsoever over such district (not exceeding ten miles square) as may, by cession of particular States, and the acceptance of Congress, become the seat of the Government of the United States, and to exercise like authority over all places purchased by the consent of the legislature of the State in which the same shall be, for the erection of forts, magazines, arsenals, dockyards, and other needful buildings; and

To make all laws which shall be necessary and proper for carrying into execution the foregoing powers, and all other powers vested by this Constitution in the Government of the United States, or in any department or officer thereof.

Sec. 9. The migration or importation of such persons as any of the States now existing shall think proper to admit shall not be prohibited by Congress prior to the year one thousand eight hundred and eight; but a tax or duty may be imposed on such importation, not exceeding ten dollars for each person.

The privilege of the writ of *habeas corpus* shall not be suspended, unless when in cases of rebellion or invasion the public safety may require it.

No bill of attainder or *ex post facto* law shall be passed.

No capitation or other direct tax shall be laid, unless in proportion to the census or enumeration hereinbefore directed to be taken.

No tax or duty shall be laid on articles exported from any State.

No preference shall be given by any regulation of commerce or revenue to the ports of one State over those of another; nor shall vessels bound to or from one State be obliged to enter, clear, or pay duties in another.

No money shall be drawn from the treasury but in consequence of appropriations made by law; and a regular statement and account of the receipts and expenditures of all public money shall be published from time to time.

No title of nobility shall be granted by the United States; and no person holding any office of profit or trust under them shall, without the consent of the Congress, accept of any present, emolument, office, or title, of any kind whatever, from any king, prince, or foreign State.

Sec. 10. No State shall enter into any treaty, alliance, or confederation; grant letters of marque and reprisal; coin money; emit bills of credit; make anything but gold and silver coin a tender in payment of debts; pass any bill of attainder, *ex post facto* law, or law impairing the obligation of contracts, or grant any title of nobility.

No State shall, without the consent of the Congress, lay any imposts or duties on imports or exports, except what may be absolutely necessary for executing its inspection laws; and the net produce of all duties and imposts, laid by any State on imports or exports, shall be for the use of the treasury of the United States; and all such laws shall be subject to the revision and control of the Congress.

No State shall, without the consent of Congress, lay any duty of tonnage, keep troops, or ships of war in time of peace, enter into any agreement or compact with another State, or with a foreign power, or engage in war, unless actually invaded, or in such imminent danger as will not admit of delay.

ARTICLE II, Sec. 1. The executive power shall be vested in a President of the United States of America. He shall hold his office during the term of four years, and, together with the Vice President, chosen for the same term, be elected as follows:

Each State shall appoint, in such manner as the legislature thereof may direct, a number of electors, equal to the whole number of Senators and Representatives to which the State may be entitled in the Congress; but no Senator or Representative, or persons holding an office of trust or profit under the United States, shall be appointed an elector.

The Congress may determine the time of choosing the electors, and the day on which they shall give their votes; which day shall be the same throughout the United States.

No person, except a natural-born citizen or a citizen of the United States at the time of the adoption of the Constitution, shall be eligible to the office of President; neither shall any person be eligible to that office who shall not have attained to the age of thirty-five years, and been fourteen years resident within the United States.

In case of the removal of the President from office, or of his death, resignation, or inability to discharge the powers and duties of the said office, the same shall devolve on the Vice President, and the Congress may by law provide for the case of removal, death, resignation, or inability, both of the President and Vice President, declaring what officer shall then act as President, and such officer shall act accordingly, until the disability be removed, or a President shall be elected.

The President shall, at stated times, receive for his services a compensation, which shall neither be increased nor diminished during the period for which he shall have been elected, and he shall not receive within that period any other emolument from the United States, or any of them.

Before he enters on the execution of his office, he shall take the following oath or affirmation: "I do solemnly swear (or affirm) that I will faithfully execute the office of President of the United States, and will, to the best of my

ability, preserve, protect, and defend the Constitution of the United States."

Sec. 2. The President shall be commander in chief of the army and navy of the United States, and of the militia of the several States when called into the actual service of the United States; he may require the opinion, in writing, of the principal officer in each of the executive departments upon any subject relating to the duties of their respective offices, and he shall have power to grant reprieves and pardons for offenses against the United States, except in cases of impeachment.

He shall have power, by and with the advice and consent of the Senate, to make treaties, provided two-thirds of the Senators present concur; and he shall nominate, and by and with the advice and consent of the Senate, shall appoint ambassadors, other public ministers and consuls, judges of the Supreme Court, and all other officers of the United States, whose appointments are not herein otherwise provided for, and which shall be established by law; but the Congress may by law vest the appointment of such inferior officers as they think proper in the President alone, in the courts of law, or in the heads of departments.

The President shall have power to fill up all vacancies that may happen during the recess of the Senate, by granting commissions which shall expire at the end of their next session.

Sec. 3. He shall from time to time give to the Congress information of the state of the Union, and recommend to their consideration such measures as he shall judge necessary and expedient; he may on extraordinary occasions convene both Houses, or either of them, and in cases of disagreement between them, with respect to the time of adjournment, he may adjourn them to such time as he shall think proper; he shall receive ambassadors and other public ministers; he shall take care that the laws be faithfully executed, and shall commission all the officers of the United States.

Sec. 4. The President, Vice President, and all civil officers of the United States, shall be removed from office on impeachment for, and conviction of, treason, bribery, or other high crimes and misdemeanors.

ARTICLE III, Sec. 1. The judicial power of the United States shall be vested in one Supreme Court, and in such inferior courts as the Congress may from time to time ordain and establish. The judges, both of the Supreme and inferior courts, shall hold their offices during good behavior, and shall, at stated times, receive for their services a compensation, which shall not be diminished during their continuance in office.

Sec. 2. The judicial power shall extend to all cases, in law and equity, arising under this Constitution, the laws of the United States, and treaties made, or which shall be made, under their authority; to all cases affecting ambassadors, other public ministers, and consuls; to all cases of admiralty and maritime jurisdiction; to controversies to which the United States shall be a party; to controversies between two or more States; between a State and citizens of another State; between citizens of different States; between citizens of the same State claiming lands under grants of different States, and between a State, or the citizens thereof, and foreign States, citizens, or subjects.

In all cases affecting ambassadors, other public ministers, and consuls, and those in which a State shall be party, the Supreme Court shall have original jurisdiction. In all the other cases before mentioned, the Supreme Court shall have appellate jurisdiction, both as to law and fact, with such exceptions and under such regulations as the Congress shall make.

The trial of all crimes, except in cases of impeachment, shall be by jury; and such trial shall be held in the State where the said crimes shall have been committed; but when not committed within any State, the trial shall be at such place or places as the Congress may by law have directed.

Sec. 3. Treason against the United States shall consist only in levying war against them, or in adhering to their enemies, giving them aid and comfort.

No person shall be convicted of treason unless on the testimony of two witnesses to the same overt act, or on confession in open court.

The Congress shall have power to declare the punishment of treason; but no attainder of treason shall work corruption of blood, or forfeiture except during the life of the person attainted.

ARTICLE IV, Sec. 1. Full faith and credit shall be given in each State to the public acts, records, and judicial proceedings of every other State. And the Congress may by general laws prescribe the manner in which such acts, records, and proceedings shall be proved, and the effect thereof.

Sec. 2. The citizens of each State shall be entitled to all privileges and immunities of citizens in the several States.

A person charged in any State with treason, felony, or other crime, who shall flee from justice, and be found in another State, shall, on demand of the executive authority of the State from which he fled, be delivered up, to be removed to the State having jurisdiction of the crime.

No person held to service or labor in one State, under the laws thereof, escaping into another, shall, in consequence of any law or regulation therein, be discharged from such service or labor, but shall be delivered up on claim of the party to whom such service or labor may be due.

Sec. 3. New States may be admitted by the Congress into this Union; but no new State shall be formed or erected within the jurisdiction of any other State, nor any State be formed by the junction of two or more States, or parts of States, without the consent of the legislatures of the States concerned as well as of the Congress.

The Congress shall have power to dispose of and make all needful rules and regulations respecting the territory or other property belonging to the United States; and nothing in this Constitution shall be so construed as to prejudice any claims of the United States, or any particular State.

Sec. 4. The United States shall guarantee to every State in this Union a republican form of government, and shall protect each of them against invasion, and, on application of the legislature, or of the Executive (when the legislature cannot be convened), against domestic violence.

ARTICLE V. The Congress, whenever two-thirds of both Houses shall deem it necessary, shall propose amendments to this Constitution, or, on the application of the legislatures of

two-thirds of the several States, shall call a convention for proposing amendments, which, in either case, shall be valid to all intents and purposes as part of this Constitution, when ratified by the legislatures of three-fourths of the several States, or by conventions in three-fourths thereof, as the one or the other mode of ratification may be proposed by the Congress; provided, that no amendment which may be made prior to the year one thousand eight hundred and eight shall in any manner affect the first and fourth clauses in the ninth section of the first article; and that no State, without its consent, shall be deprived of its equal suffrage in the Senate.

ARTICLE VI. All debts contracted and engagements entered into before the adoption of this Constitution shall be as valid against the United States under this Constitution, as under the Confederation.

This Constitution and the laws of the United States which shall be made in pursuance thereof, and all treaties made, or which shall be made, under the authority of the United States, shall be the supreme law of the land; and the judges in every State shall be bound thereby, anything in the Constitution or laws of any State to the contrary notwithstanding.

The Senators and Representatives before mentioned, and the members of the several State legislatures, and all executive and judicial officers, both of the United States and of the several States, shall be bound by oath or affirmation to support this Constitution; but no religious test shall ever be required as a qualification to any office or public trust under the United States.

ARTICLE VII. The ratification of the conventions of nine States shall be sufficient for the establishment of this Constitution between the States so ratifying the same.

Done in convention, by the unanimous consent of the States present, the 17th day of September, in the year of our Lord one thousand seven hundred and eighty-seven, and of the independence of the United States of America the twelfth.

AMENDMENTS

ARTICLE I. Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof; or abridging the freedom of speech or of the press; or the right of the people peaceably to assemble, and to petition the Government for redress of grievances.

ARTICLE II. A well-regulated militia being necessary to the security of a free State, the right of the people to keep and bear arms shall not be infringed.

ARTICLE III. No soldier shall, in time of peace, be quartered in any house without the consent of the owner, nor in time of war but in a manner to be prescribed by law.

ARTICLE IV. The right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures, shall not be violated; and no warrants shall issue but upon probable cause, supported by oath or affirmation, and particularly describing the place to be searched, and the persons or things to be seized.

ARTICLE V. No person shall be held to answer for a capital or otherwise infamous crime, unless on a presentment or indictment of a grand jury, except in cases arising in the land or naval forces, or in the militia, when in actual service, in time of war and public danger; nor shall any person be subject for the same offense to be twice put in jeopardy of life or limb, nor shall be compelled in any criminal case to be a witness against himself, nor be deprived of life, liberty, or property, without due process of law; nor shall private property be taken for public use without just compensation.

ARTICLE VI. In all criminal prosecutions, the accused shall enjoy the right to a speedy and public trial, by an impartial jury of the State and district wherein the crime shall have been committed, which district shall have been previously ascertained by law, and to be informed of the nature and cause of the accusations; to be confronted with the witnesses against him; to have compulsory process for obtaining witnesses in his favor, and to have the assistance of counsel for his defense.

ARTICLE VII. In suits at common law, where the value in controversy shall exceed twenty dollars, the right of trial by jury shall be preserved, and no fact tried by a jury shall be otherwise reëxamined in any court of the United States than according to the rules of the common law.

ARTICLE VIII. Excessive bail shall not be required, nor excessive fines imposed, nor cruel and unusual punishment inflicted.

ARTICLE IX. The enumeration in the Constitution of certain rights shall not be construed to deny or disparage others retained by the people.

ARTICLE X. The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people.

ARTICLE XI. The judicial power of the United States shall not be construed to extend to any suit in law or equity commenced or prosecuted against one of the United States by citizens of another State, or by citizens or subjects of any foreign State.

ARTICLE XII. The electors shall meet in their respective States, and vote by ballot for President and Vice President, one of whom at least shall not be an inhabitant of the same State with themselves. They shall name in their ballots the person voted for as President, and in distinct ballots the person voted for as Vice President; and they shall make distinct lists of all persons voted for as President, and of all persons voted for as Vice President, and of the number of votes for each, which lists they shall sign and certify, and transmit, sealed, to the seat of the Government of the United States, directed to the President of the Senate. The President of the Senate shall, in the presence of the Senate and House of Representatives, open all the certificates, and the votes shall then be counted; the person having the greatest number of votes for President shall be the President, if such number be a majority of the whole number of electors appointed; and if no person have such a majority, then from the persons having the highest numbers, not exceeding three, on the list of those voted for as President, the House of Representatives shall choose immediately, by ballot, the President. But in choosing the President, the votes shall be taken by States, the representation from each State having one vote; a quorum for this purpose shall consist of a member or

members from two-thirds of the States, and a majority of all the States shall be necessary to a choice. And if the House of Representatives shall not choose a President, whenever the right of choice shall devolve upon them, before the fourth day of March next following, then the Vice President shall act as President, as in the case of the death or other constitutional disability of the President. The person having the greatest number of votes as Vice President shall be the Vice President, if such number be a majority of the whole number of electors appointed; and if no person have a majority, then from the two highest numbers on the list the Senate shall choose the Vice President; a quorum for the purpose shall consist of two-thirds of the whole number of Senators, and a majority of the whole number shall be necessary to a choice. But no person constitutionally ineligible to the office of President shall be eligible to that of Vice President of the United States.

ARTICLE XIII, Sec. 1. Neither slavery nor involuntary servitude, except as a punishment for crime whereof the party shall have been duly convicted, shall exist within the United States, or any place subject to their jurisdiction.

Sec. 2. Congress shall have power to enforce this article by appropriate legislation.

ARTICLE XIV, Sec. 1. All persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States, and of the State wherein they reside. No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any State deprive any person of life, liberty, or property without due process of law, nor deny to any person within its jurisdiction the equal protection of the laws.

Sec. 2. Representatives shall be apportioned among the several States according to their respective numbers, counting the whole number of persons in each State, excluding Indians not taxed. But when the right to vote at any election for the choice of electors for President and Vice President of the United States, Representatives in Congress, the executive and judicial officers of a State, or the members of the legislature thereof, is denied to any of the male inhabitants of such State being twenty-one years of age, and citizens of the United States, or in any way abridged, except for participation in rebellion or other crime, the basis of representation therein shall be reduced in the proportions which the number of such male citizens shall bear to the whole number of male citizens twenty-one years of age in such State.

Sec. 3. No person shall be a Senator or Representative in Congress, or Elector of President and Vice President, or hold any office, civil or military, under the United States, or under any State, who, having previously taken an oath as a member of Congress, or as an officer of the United States, or as a member of any State legislature, or as an executive or judicial officer of any State, to support the Constitution of the United States, shall have engaged in insurrection or rebellion against the same, or given aid or comfort to the enemies thereof. But Congress may, by a vote of two-thirds of each House, remove such disability.

Sec. 4. The validity of the public debt of the United States authorized by law, including debts incurred for payment of pensions and bounties for services in suppressing insurrection or rebellion, shall not be questioned. But neither the United States nor any State shall assume or pay any debt or obligation incurred in aid of insurrection or rebellion against the United States, or any claim for the loss or emancipation of any slave; but all such debts, obligations, and claims shall be held illegal and void.

Sec. 5. The Congress shall have power to enforce, by appropriate legislation, the provisions of this article.

ARTICLE XV, Sec. 1. The right of the citizens of the United States to vote shall not be denied or abridged by the United States, or by any State, on account of race, color, or previous condition of servitude.

Sec. 2. The Congress shall have power to enforce this article by appropriate legislation.

ARTICLE XVI. The Congress shall have power to lay and collect taxes on incomes, from whatever source derived, without apportionment among the several States, and without regard to any census or enumeration.

ARTICLE XVII, Sec. 1. The Senate of the United States shall be composed of two Senators from each State, elected by the people thereof, for six years; and each Senator shall have one vote. The electors in each State shall have the qualifications requisite for electors of the most numerous branch of the State legislatures.

Sec. 2. When vacancies happen in the representation of any State in the Senate, the executive authority of such State shall issue writs of election to fill such vacancies: Provided, That the legislature of any State may empower the executive thereof to make temporary appointment until the people fill the vacancies by election as the legislature may direct.

Sec. 3. This amendment shall not be so construed as to affect the election or term of any Senator chosen before it becomes valid as part of the Constitution.

ARTICLE XVIII. Sec. 1. After one year from the ratification of this article the manufacture, sale, or transportation of intoxicating liquors within, the importation thereof into, or the exportation thereof from the United States and territory subject to the jurisdiction thereof for beverage purposes is hereby prohibited.

Sec. 2. The Congress and the several States shall have concurrent power to enforce this article by appropriate legislation.

Sec. 3. This article shall be inoperative unless it shall have been ratified as an amendment to the Constitution by the Legislatures of the several States, as provided by the Constitution, within seven years from the date of the submission hereof in the States by the Congress.

ARTICLE XIX. Sec. 1. The right of citizens of the United States to vote shall not be denied or abridged by the United States or by any State on account of sex.

Sec. 2. Congress shall have power by appropriate legislation to enforce the provisions of this article.

CONSTRUCTION (Lat. *constructio*, from *construere*, to construct, from *com-*, together + *struere*, to heap). In geometry, the process of

drawing a figure so as to satisfy the conditions of a given problem. Thus, to construct an equilateral triangle of side a: with the ends of a as centers and with a radius equal to a describe circles; connect either intersection with the ends of a. Here the construction seems at first not to be unique, since two triangles satisfy the condition, but it is evident that there is essentially only one construction for the triangles are congruent. In solving problems, a valuable method is to assume the construction and investigate the properties of the figure. Thus, to draw a line through a given point parallel to a given line: assuming the construction and a transversal of the parallels through the given point, it appears that the alternate angles are equal; hence, to construct the figure, draw a transversal through the point cutting the given line and construct the alternate angle equal to the angle formed by the transversal and the given line.

Another fruitful method is that of the intersection of loci; e.g., if it is known that a point is on each of two intersecting straight lines, it is uniquely determined as their point of intersection; but if it is on a straight line and a circle which the line intersects, it may be either of the two points of intersection.

The best works upon the constructions of elementary geometry are Petersen, *Methods and Theories* (Copenhagen and London, 1879); Rouché and De Comberousse, *Traité de géométrie* (Paris, 1900); Alexandroff, *Problèmes de géométrie élémentaire*, trans. into French by Aitoff (Paris, 1899); Knobloch, *Sammlung geometrischen Konstruktionen* (Altona, 1911); and Adler, *Theorie der geometrischen Konstruktionen* (Leipzig, 1906).
